(2) Of women. Originally all women not under *patria potestas* or *manus* needed *tutores*, who were appointed in the same way as those for children. In classical times already this *perpetua tutela mulierum* was little more than a burdensome technicality and it had long disappeared from Justinian's law.

(3) Of lunatics and spendthrifts. Originally such persons were placed under the *cura* of their agnates; later, magistrates appointed curators.

(4) Of minors. Originally children were considered adult when of the age of puberty, but, by a long development, it became usual for those above puberty and under 25 to have *curatores* who were always magistratically appointed.

PROPERTY AND POSSESSION

The most striking thing to an English lawyer accustomed to the complexities of English real property law is the absence of any fundamental distinction between the treatment of land and the treatment of movables. Both can, in the law as we know it, be owned absolutely by individuals, though there may have been a time at Rome as elsewhere when land was subject to communal ownership of some sort. This conception of absolute ownership (*dominium*) is also characteristically Roman, as opposed to the relative idea of ownership as the better right to possession which underlies the Germanic systems, which also, originally, underlay that of Rome. This can be seen by comparing the form of a *vindictio* (the claim of an owner out of possession) under the *legis actio* system of procedure with that which it later assumed under the formula system. In the earlier system the plaintiff first makes his assertion of ownership ("I say that this thing is mine") and then the defendant makes a similar assertion. Finally, the thing goes to the one whose assertion is based on the better right. Under the later system there is no assertion by the defendant at all; the *iudex* is instructed to condemn the defendant if it appears to him that the thing belongs to the plaintiff, otherwise to absolve the defendant. Hence, unless the plaintiff makes good his title absolutely, the defendant, though he may have no title at all, remains in possession.

A great part of what the jurists have to say on the subject of property comes under the heading "methods of acquiring ownership." These were divided into two classes according as they fell under the *ius civile* or the *ius gentium*.

I. **Methods of the *Ius Civile*** (a) *Mancipatio*.—This was a ceremonial conveyance needing for its accomplishment the presence of the transferor and transferee, five witnesses (Roman citizens of full age) a pair of scales, a man to hold them (*libripens*) and an ingot of copper. The transferee grasped the thing and said: "I assert that this thing is mine by Quiritarian law; and be it bought to me with this piece of copper and these copper scales." He then struck the scales with the ingot which he handed to the transferor "by way of price." Clearly this was, as Gaius says, a "symbolical sale," and the relic of a real sale. Originally, when money was unknown, the price in uncoined copper had been really weighed out to the vendor. When this became unnecessary there was still a pretence of weighing, but the price was paid separately, and the form could be used as a conveyance where it was not intended that a price should be paid at all, e.g., because the transferor was making a gift to the transferee.

(b) *In Iure Cessio*.—This was a conveyance in the form of a lawsuit. The transferee claims before the magistrate that the thing is his, and the transferor who is the defendant, admits the claim. The magistrate then adjudges the thing to the transferee.

(c) *Usucapio*.—According to the XII Tables, two years' continuous possession gave title in the case of land, one year in the case of movables. In the developed law, possession must have begun in good faith, the thing must not be one which has been stolen (even though the possessor himself is quite innocent of the theft) or occupied by violence (this applies especially to land, which could not be stolen) and the possession must have had a justifiable beginning (*iustus titulus*). *Usucapio*, being an institution of the *ius civile* was possible only to citizens, but Justinian fused it with a similar institution (*praescriptio longi temporis*) which had grown up in the provinces. Under his system, three years were required for movables, 10 or 20 for land.

II. **Methods of the *Ius Gentium*** (a) *Occupatio*.—Ownerless things, provided they are capable of private ownership (not, e.g., *res sacrae*, such as temples) became the property of the first person to take possession of them. This applies e.g., to game, and

to articles which have been abandoned or left unattended by their owners.

(b) *Accessio*.—If an accessory thing belonging to A was joined to a principal one belonging to B, the ownership in the whole went to B, e.g., if A's purple be used to dye B's cloth, the dyed cloth belongs wholly to B. By far the most important application of this rule is expressed by the maxim *superficies solo cedit*, i.e., whatever is built on land becomes part of the land and cannot be separately owned.

(c) *Specificatio*.—If A made a thing out of material belonging to B the Proculians held that ownership went to A, the Sabinians, that it remained in B. Justinian adopted a famous "middle opinion," according to which B retained ownership if reversion to the original condition was possible (a bronze vase can be melted down), A obtained ownership if it was not (wine cannot be converted into grapes).

(d) *Thesauri Inventio*.—The final rule as regards treasure trove was that if it were found by a man on his own land, it went to him; if on that of another, half went to the finder, half to the landowner.

(e) *Traditio*, i.e., simple delivery of possession with the intention of passing ownership. This was the method of conveyance of the *ius gentium*. It sufficed to pass full Quiritarian ownership of *res nec mancipi*, but not of *res mancipi* (land in Italy, slaves, beasts of draft and burden, and certain rustic servitudes) for which either *mancipatio* or *in iure cessio* was necessary. If therefore A sold and merely delivered a slave to B, A remained at civil law owner of the slave until usucapion had taken place. The praetor however devised methods of protecting B's possession in such a way that A's title became valueless, and B was said to have the thing *in bonis*. From this phrase later writers coined the expression "bonitarian" ownership. Already before Justinian's day *mancipatio* and *in iure cessio* had become obsolete and Justinian took the final step of abolishing the theoretical distinction between Quiritarian and "bonitarian" ownership.

Forms of Property in Land Other Than Ownership.

The ordinary leaseholder according to Roman law had no protection beyond a contractual right against his landlord, and he could not assign his tenancy, but there were two kinds of tenure which, under the praetorian system, obtained protection against third parties as well, and became assignable. These were *superficies* and *emphyteusis*; the former resulting from building leases granted for a long term or in perpetuity, the latter from similar agricultural leases. Both appear to have first originated in grants by the State, or municipalities. Under *emphyteusis* the grantee did not become owner, though he enjoyed a *jus in re aliena* hardly distinguishable from ownership.

Servitudes.—(a) *Praedial servitudes* (i.e., easements or *profits à prendre*) were divided into two categories, rustic and urban, according as they served the need of agricultural land or of buildings. Thus rights of way and of water are usually classed as rustic, while rights to light, to view or to support were urban. Praedial servitudes could only be appurtenant, i.e., they could not exist except as additional advantages attached to the ownership of a piece of land (the "dominant tenement").

(b) *Personal Servitudes*.—The law of Justinian's day brought under the heading of servitudes also the rights of *usufructus* and *usus*. Usufruct was the right to use and take the fruits (e.g., crops) of a thing and corresponded to our life-interest. *Usus* was a more restricted right, also not extending beyond the life of the holder, merely to the use of a thing; thus the usufruct of a house could live in it himself but could not let it, as that would be equivalent to taking the fruits.

Possession.—Implied in the absolute conception of ownership is a sharp distinction between ownership and possession. The civil law did not protect possession as such, but one of the most important parts of the praetorian system was constituted by the *interdicta* (special types of remedy) which protected an existing possession irrespective of its rightfulness, i.e., anyone wishing to interfere with it must bring an action and prove his title. If he interfered on his own authority, the praetor would see that the original state of affairs was restored.

OBLIGATIONS

Obligations were classified by the jurists into two main categories, according as they arose from delict (tort) or contract: the remaining obligations the Byzantines placed under the headings of quasi-contract and quasi-delict.

I. *Delict*.—The XII. Tables already show the law in a state of transition from the system of private vengeance to that in which the state insists on the acceptance of compensation instead of vengeance by the person wronged and fixes its amount. Thus in the case of assault (*iniuria*) if one man broke another's limb, talion was still permitted, i.e., the person wronged could inflict the same injury as he had received, but in other cases there were fixed money penalties, e.g., 25 asses for a blow. Theft involved a penalty of twice the value of the thing stolen, unless the thief was caught in the act (*furtum manifestum*) in which case he was flogged and "adjudged" to the person wronged.

In classical times, praetorian reforms had substituted a fourfold penalty in the case of *furtum manifestum* and penalties for *iniuria* (which now included defamation and insulting behaviour) were assessed in each case by the court. The law of damage to property was regulated by a statute (*lex Aquilia*) dating from the republic, but later than the XII. Tables, much extended by interpretation and by the praetor, and praetorian actions lay for a number of new delicts of varying importance.

II. *Contract*.—At the time of the XII. Tables a law of contract can hardly be said to have existed, though we know of an institution called *nexus* of which hardly anything can be said with certainty except that it was a kind of loan so oppressive in character that it might result in the debtor's complete subjection to the creditor. It was obsolete long before classical times. The contracts of classical law were divided into four classes, literal, verbal, real and consensual. The literal contract was a type of fictitious loan formed by an entry in the creditor's account book; it was comparatively unimportant, and obsolete in Justinian's day. The verbal contract or *stipulatio* was of great importance, for it provided a form in which any agreement (provided it was lawful and possible) might be made binding by the simple method of reducing it to question and answer, e.g., "do you promise to pay me ten thousand sesterces?"—"I promise." Originally it was absolutely necessary that the words should be spoken, but it may be said (technicalities apart) that by Justinian's day a written memorandum of such a contract would be binding, even though in fact there had been no speaking at all. If an agreement was not clothed in the form of a stipulation, it must, to be valid, fall, according to its content, under one of the types of real, or consensual contracts. A real contract is one which needs for its conclusion (in addition to the consent of the parties) that some thing should be transferred from one party to the other and that the obligation arising should be for the return of the thing transferred. The real contracts are *mutuum* (loan, e.g., of money), *commodatum* (loan, e.g., of a horse), deposit and pledge. Consensual contracts need no element for their formation except agreement—whether expressed in words or otherwise—between the parties, and though there were only four such known to the law, these were the most important in ordinary life—*emptio venditio* (sale), *locatio conductio* (hire of things or services and also giving out jobs to be done), *societas* (partnership) and *mandatum* (agency). In Justinian's day it was further a principle that in any case of reciprocal agreement, e.g., an agreement for exchange (which was not sale), if one party had performed, he could bring an action to enforce performance by the other ("innominate contract").

SUCCESSION AT DEATH

I. *Testamentary Succession*.—That wills existed already at the time of the XII. Tables is certain, and it is highly probable that the form used was still that mentioned by Gaius as the oldest, the will made publicly in the assembly of the *curiae* (*testamentum comitiis calatis*), with the will made before the people drawn up for battle (*testamentum in procinctus*) as a variant. It may be however that the mandatory will (*testamentum per aes et libram*) had already been invented. This began as an expedient

for effecting the purposes of a will in an emergency, when the other forms were impossible, and consisted in the use of mancipation to convey the estate of the dying man to a kind of trustee (*familiae emptor*) who then distributed it in accordance with the testator's instructions. By the end of the republic, however, the older forms had disappeared, the mancipation had become a mere formality and the instructions of the testator, which were now contained in a written document, constituted a true will, operative only at death and revocable at any time during the testator's lifetime by the making of a new will. In post-classical times the mancipation had ceased to be necessary and the commonest form of will was the *testamentum tripertitum*, needing for its completion the seals of seven witnesses and the signatures of the witnesses and of the testator. In classical times the praetor had already given effect in most cases to a document sealed by seven witnesses.

The first requirement of any Roman will of historical times was the appointment of one or more *heredes*. A *heres* is a universal successor, i.e., he takes over the rights and duties of the deceased (in so far as they are transmissible at all) as a whole. On acceptance, the heir becomes owner where the deceased was owner, creditor where he was creditor and debtor where he was debtor, even though the assets were insufficient to pay the debts. It was thus possible for an inheritance to be *damosa*, i.e., to involve the heir in loss. Until Justinian's day this consequence could only be avoided by not accepting the inheritance, but Justinian made one of his most famous reforms by introducing the *beneficium inventarii*, i.e., the heir who, within a certain time after the acceptance made an inventory of the deceased's assets, need not pay out more than he had received. In addition to appointing an heir, the testator might also leave legacies, i.e., particular gifts which are a burden on the heir. Freedom of testation was, however, not complete, a man being obliged to leave a certain proportion of his property to his children and, in some cases, to ascendants, and brothers and sisters.

II. *Intestate Succession*.—The history of intestate succession consists broadly in the gradual supersession of a purely agnatic system (i.e., one which takes account of relationship through males exclusively) by a cognatic system (in which relationship is traced indifferently through males or females). The agents in the change were first the praetors and afterwards imperial legislation.

By the XII. Tables those first entitled were the *sui heredes* of the deceased, i.e., those who were in his *potestas* or *manus* when he died and became free from power at his death. Failing these, the nearest agnatic relation (or relations, if there were several of the same degree) succeeded, and, if there were no agnates, the members of the *gens* (clan) of the deceased. Praetorian reforms placed emancipated children on an equality with *sui* and gave to the nearest cognates, or failing such, to the surviving spouse (in marriage without *manus*) rights of succession in the absence of agnates; gentile succession became obsolete probably in the first century A.D. Even under this system it will be seen that a woman would not succeed to a child of hers if any agnate (e.g., a paternal uncle) were alive, nor a child to its mother if there were any agnate of hers. Both these cases were dealt with before the end of the classical period, the former by the *Sc. Tertullianum* (under Hadrian) which gave certain rights of succession to mothers who had the *ius liberorum* (i.e., had borne three children) and the latter by the *Sc. Orphitianum* of A.D. 178, which gave to children the first right to succeed to their mothers. Succeeding emperors made many changes but it was not until Justinian's day that the cognatic system completely triumphed. By Novel 118, completed by Novel 127, a new system was introduced, the principal features of which were the following: Descendants had the first claim, and failing these, a composite class consisting of ascendants, brothers and sisters of the full blood, and children of deceased brothers and sisters. Next came brothers and sisters of the half blood and finally the nearest cognate or cognates if there were several in the same degree.

Husband and wife were not mentioned, but their old (praetorian) rights were kept alive in the absence of any of the above

categories. Justinian also gave to the poor widow a right to one quarter of her husband's estate unless there were more than three children, in which case she shared equally with them. If, however, the heirs were her own children by the deceased, she only received the usufruct (life interest) in what she took.

PROCEDURE

The earliest form of procedure known to have existed is that of the *legis actioes*; this was superseded by the formulary system, which in its turn, gave way to *cognitio extraordinaria*. Characteristic of both the earlier systems is the division into two stages, a preliminary one before the jurisdictional magistrate (*in iure*) and the actual trial before the *iudex*. The object of the first stage is to arrive at an issue, which under the *legis actio* system has to be achieved by the speaking of set forms of words by the parties and sometimes, at least, by the magistrate. Thus in a *vindicatio* (v. *supra*) each party, when making his assertion of ownership grasps the thing in dispute and lays a wand on it, after which the magistrate intervenes and says "Let go both of you." So formal was the procedure that a plaintiff who made the slightest mistake lost his case. For this state of affairs the formulary system provided a remedy. It superseded the older system, so Gaius tells us, as a result of the *lex Aebutia* (date much disputed, perhaps between 149 and 126 B.C.), and two *leges Iuliae* (of Augustus). Between the *lex Aebutia* and the *leges Iuliae* the two systems were both in use.

Under the new procedure the issue was formulated in written instructions (*formula*) to the *iudex*, couched in the form of an alternative, e.g., "If it appear that the defendant owes the plaintiff ten thousand sesterces the *iudex* is to condemn the defendant to pay the Plaintiff ten thousand sesterces; if it does not so appear, he is to absolve him." A draft of the *formula* was probably prepared by the plaintiff before he came into court, but there could be no trial until it was accepted by the defendant; for there was always a contractual element about a lawsuit under both older systems. Pressure could, however, be exercised by the magistrate on a defendant who refused to accept a *formula* of which the magistrate approved, just as a plaintiff could be forced to alter a *formula* of which the magistrate disapproved, by the magistrate's refusal to give his order to the *iudex* to decide the case unless the alteration were made.

The process by which the *cognitio extraordinaria* took its place was gradual, and was accomplished in the provinces earlier than in Rome. Briefly, the new system meant that the magistrate used his administrative powers, always large, for the purpose of settling disputes. He could command, and thus if one man brought a complaint against another before him, he could investigate the matter and give the order he thought fit. As imperially appointed officers who had no *iurisdictio* in the old sense, superseded republican magistrates, so this administrative process became more common. The result is that the old contractual element in procedure disappears, as well as the old division into two stages. Justice is now imposed from above by the state, not, as originally, a kind of voluntary arbitration supervised by the state.

BIBLIOGRAPHY—Among the chief modern text-books are:—W. W. Buckland, *A Text-book of Roman Law from Augustus to Justinian* (Cambridge, 1921), and (shorter) *A Manual of Roman Law* (Cambridge, 1925); P. F. Girard, *Manuel élémentaire de droit romain* (7th ed., Paris, 1924); R. Sohm, *Institutionen des römischen Rechts* (17th ed., Munich and Leipzig, 1906). (English translation of 9th edition by Ledlie, Oxford, 1907). For Sources and History see e.g., P. Krüger, *Geschichte der Quellen und Literatur des röm. Rechts* (2nd ed., Munich and Leipzig, 1912); T. Klipp, *Geschichte der Quellen des röm. Rechts* (4th ed., Leipzig, 1910); B. Kübler, *Geschichte des röm. Rechts* (Leipzig, 1925); G. Cornil, *Droit romain, aperçu historique sommaire* (Brussels, 1921); E. Costa, *Storia del diritto romano privato* (2nd ed., Turin, 1925); J. Muirhead, *Historical Introduction to the Private Law of Rome*, 3rd ed., London, 1916. Rechts*) and E. Rabell's on the private law of classical times (*Grundzüge des röm. Privatrechts*) are both authoritative and contain full references to modern literature.

(H. F. J.)

ROMANOFF DYNASTY, the rulers of Russia from 1613 to 1917. The last direct descendant of the earlier dynasty of Rurik, Tsar Theodor, son of Ivan (John) the Terrible, died in 1598. After him the throne was occupied first by his brother-in-law, Boris Godunov, then by an adventurer claiming to be a son of Ivan the Terrible (usually known as the false Demetrius). After his murder, in 1606, Prince Basil Shuiskiy was proclaimed tsar, but was dethroned four years later. The faction which was in power offered the crown to Vladislav, son of the king of Poland. A Polish army advanced to support his claim. Another faction brought in a Swedish army to fight the Poles. In the meantime two more men sprang up in succession, both pretending to be Demetrius, miraculously saved from death. The country was in confusion and civil war till Minin, a tradesman from Nijni-Novgorod, joined hands with Prince Pojarski, one of the generals who had proved himself an efficient soldier. They formed an army and took Moscow in Oct. 1612; they then sent messengers all over the country urging the people to choose representatives who would assemble in Moscow to elect a new ruler. On Feb. 27, 1613, Michael Romanoff was unanimously proclaimed tsar.

The Romanoffs were not of Rurik's stock, nor were they even of very ancient lineage. They descended from a German nobleman who had emigrated to Moscow early in the 14th century. His fifth son, nicknamed Kosha (the Cat), became head of the family of Koshkins, many of whom were prominent at the court of Moscow in the 14th and 15th centuries. Early in the 16th century one of them, whose first name was Roman, called himself Romanoff. His daughter, Anastasia, was Ivan the Terrible's first wife; it was her son, Theodor, who was the last tsar of the Rurik dynasty. As Ivan the Terrible had no high opinion of his son's mental powers, he appointed a council of noblemen to transact business for his successor, and Anastasia's brother, Nikita, was chairman of this council. He made himself very popular by his constant defence of common people's rights, and one of his sons, Theodor, was celebrated for his learning and refined manners. Boris Godunov, fearing the popularity of the Romanoffs, had obliged Theodor and his wife to divorce and to become monk and nun. It was their son, Michael, who was elected tsar in 1613.

Theodor's monastic name was Philarete. After Boris Godunov's death Philarete became metropolitan of Rostov. At the time of his son's election to the throne, he was a prisoner in Poland. Michael was only 16 years old, and was living with his mother in a convent. His personal reputation played a minor part with those who chose him, as in their eyes he was the lawful heir, being nephew to the last tsar descending from Rurik. His name had been often mentioned in those years of civil war as the only one on which all shades of opinion might meet. A popular rumour asserted that when Tsar Theodor was dying, he appointed his cousin Theodor Romanoff (now the monk Philarete) as his successor, but Godunov stepped in and prevented the tsar's will being fulfilled. As Philarete had taken monastic vows, he could not ascend the throne; besides the *boyars* thought Michael, a mere boy, would be a more manageable sovereign. His election was no doubt due to the general striving after legitimacy, which was satisfied by his close relationship to the extinct dynasty. Three years later his father returned to Moscow and was made patriarch; he then reigned jointly with his son and up to his death in 1633 all State documents bore Philarete's signature on a par with Michael's.

The main work of the Romanoff dynasty was to extend Russia up to her natural geographical limits, and to turn her into a European State from the semi-Asiatic one she had become after being under Tatar rule. Though this policy is usually connected with the name of Peter the Great, it was actually started by his grandfather and unwaveringly pursued by his successors down to the 20th century. But though the general trend of Russia's internal and international development progressed along the same lines for three centuries, various undercurrents predominated at certain times and are characteristic of definite epochs. Those epochs, into which the history of the Romanoff dynasty may be divided for purposes of study, correspond fairly exactly with the customary division by centuries. The first epoch, when Moscow

was the only important centre and when the general intercourse with western Europe was nearly as limited as in previous days, corresponds to the 17th century, as it lasted not only till 1689, when Peter the Great became sole ruler, but more exactly till the end of 1698, when, after his first journey abroad, he began transacting State business himself. The second period, down to the death of Paul I., corresponds to the whole of the 18th century, during which Russia, with St. Petersburg as principal centre, gradually became a European country and reached the shores of all the seas bordering on the Russian plain. The third period, from the accession of Alexander I., in 1801, down to the overthrow of the dynasty in 1917, marks the highest point of Russia's activity as a European Power. Whatever territorial enlargements were acquired in this period were in Asia and mostly due to the necessity of reaching a natural and easily defensible frontier on the Asiatic continent, whereas most of the Government's energies were devoted to the work of internal progress, both economic and educational.

I. THE 17TH CENTURY

The state of chaos to which the country had been reduced in the first years of the 17th century, set a hard task to the new dynasty. The prevailing poverty, insecurity and disorder required protracted and patient labours before the country could overcome its weakness and disorganization. All the first tsars of the Romanoff house came to the throne at such an early age that no personal guidance could be expected from any one of them for a long time. Michael, and his son Alexis, were both tsars at 16; Alexis's eldest son Theodor, at 14; Peter the Great at 10. Therefore the actual work of government was always in the hands of a council. The first three tsars never took any decision without its having been discussed by this council, but favouritism and intrigue naturally influenced the choice of its members, and all through the century continual popular risings aimed at the exclusion of one *boyar* or another, to whose predominance or to whose cupidity common gossip attributed the calamities of the day. In order to disarm public opinion the Government was constantly convening assemblies of deputies from the whole land—sometimes to discuss a special question, sometimes for submitting all pending business to their decisions. In those assemblies, called *samshi sobor*, the permanent *boyar* council represented the nobles; in addition came deputies from the clergy and from "all the land," both towns and villages. The first nine years of Michael's reign *sobors* sat in Moscow almost uninterruptedly; three more were called together in 1632, 1637 and 1642; in the first eight years of Tsar Alexis's reign there were five *sobors*. Those of later days, between 1653 and 1682 became mere commissions for elaborating points of law and had no positive authority. The Government had become stronger and had built up an efficient staff of agents of its own. On the other hand the *sobor* of 1648-49 had promulgated a code of laws, which was commonly followed and did not require further commissions to enforce universality.

Wars of the New Dynasty.—A great part of the country's strength was wasted in attempts to counteract the encroachments effected by the neighbouring powers on its territory during the period of anarchy. Out of the first 70 years of the new dynasty's rule, 30 were spent in wars against Poland and Sweden. Russia got back Smolensk and Seversk, which had been seized by the Poles, and annexed Kiev and part of Little Russia, east of the Dnieper, owing to a rising against Poland of the Cossack hetman, Bogdan Khmelinitzki, whom Moscow after long hesitations decided to back. But the effort required for obtaining those advantages did not allow of an equal amount being spent in the direction of the Baltic, where Sweden had put Russia's weakness to profit and had annexed a large area of land. The wars against Sweden led to no result in the 17th century, and Russia had to wait for Peter the Great in order to regain what she had lost in the north-west.

Down south, where since the 15th century a separate State, the khanelate of Crimea, had arisen under Turkey's protectorate, the first Romanoffs waged no regular wars; but the danger of Tatar incursions demanded the building up of defences which

slowly advanced into the Steppe, for when outposts gradually became prosperous towns, they required in turn a new line of forts to protect them. At the end of the 16th century the Crimean Tatars had twice raided the country up to the very walls of Moscow; 100 years later the fortified line of defence was already 400 m. south of the capital. But the farther Russia spread down in that direction the clearer it became that no peaceful agreement was possible so long as the Black sea was not reached, and that would have meant war with Turkey, a much too formidable opponent at that stage. A cossack hetman, Doroshenko, went to war with the Turks, applied to Moscow for help and was eventually supported; but this adventure merely led to a disastrous peace (1681) by which Western Ukraine had to be surrendered to Turkey. It took 100 years more, and all the energy of Catherine II. and of Potemkin to reverse the situation.

Taxation Reforms.—The finances of the country at the beginning of the new dynasty's rule were perhaps in a still more disastrous condition than any other branch of public service. The main spring of former revenue, taxation of cultivated land, was no more adequate owing to so many fields having been abandoned during the years of anarchy. Besides, those peasants who returned to their devastated villages were often successful in defrauding the State of their taxes. The Government was obliged gradually to work out a new system, that of taxing no more the land, but the landowner, not the "field," but the "house," as owing to the vast expanse of Russia and Siberia, where runaways could always escape with ease from official supervision, taxation of communal land laid too heavy and too iniquitous a burden on the thrifty agriculturists, whereas the lazy ones paid nothing. The same occurred with large landowners; they were responsible for the taxes due from peasants who were settled on their land, besides being obliged to come forward with a fixed number of soldiers in case of war. In order that they should be able to fulfil their obligations the peasants were gradually attached to the soil; and thus a serfdom arose which lasted up to 1861 and practically transformed the peasants into slaves.

Religious Matters.—The administration of the Church was at first entirely in the hands of Philaret, who was elected patriarch in 1616. Till his death, in 1633, he was the actual sovereign, and in ecclesiastical matters his power was absolute. In 1652 the patriarchal see was again occupied by a strong personality, Nikon. Tsar Alexis called him his "particular friend" and gave him a free hand in the reforms he undertook. He revised and corrected the texts of prayer books, the *miss.* of which had been disfigured by ignorant scribes, and abolished ceremonial practices for which no authority existed. But his activity met with strong opposition, due in most part to Nikon's tactlessness, and led to a schism, *Raskol*. Its followers, *Raskolniki*, are still numerous. Nikon's opposition to secular legislation about monastic property, and his efforts to place his own authority above that of the tsar, eventually made Alexis alter his attitude towards him. He then retired to a convent and refused to perform his duties. For nearly ten years the tsar ruled the Church in his stead, till a council was convened which deposed Nikon and appointed a new patriarch. The danger of having a man next to himself who might succeed in usurping such a measure of power, made Peter the Great abolish the Russian patriarchate.

A curious feature of the first Romanoffs is that notwithstanding their efforts to rule in accordance with the people's wishes, and though each of them in turn manifested a total lack of personal ambition, circumstances so imperiously demanded a strong hand that autocracy was evolved and imposed upon a succession of totally ungrasping autocrats. This general leaning of the country towards a firm rule prepared the way for Peter the Great's activities.

II. THE 18TH CENTURY

The salient figures among the Romanoffs of the 18th century are those of Peter the Great and of Catherine II. With Peter, Russia reached the Baltic sea after 20 years' war against Sweden; with Catherine, her southern frontier, after two wars against Turkey, came down to the Black sea, whereas, on the west, owing

to the partition of Poland, and the annexation of Courland, she came in contact with the Germanic confederation. Two brilliant episodic wars; that of the empress Elizabeth against Frederick the Great, when Russian troops occupied Berlin, and that of Paul I., against the French in Italy and Switzerland, were brought on by political alliances and led to no tangible results. Sweden's two attempts (1741 and 1788) to regain by a sudden attack some of her lost advantages nearly led to Russia spreading further over south-east Finland. Though the conquest of Finland was based neither on historical nor on ethnographical considerations, it became necessary for the security of St. Petersburg, which was founded early in the 18th century and gradually became the seat of government. Two attempts at advance in Central Asia remained fruitless; Peter the Great's conquest of the southern border of the Caspian in 1723 was annulled by the empress Ann in 1732 when the annexed provinces of Mazandaran and Ghilan were handed back to Persia. As for Peter the Great's attempt to seize Khiva and liberate the Russians who were there in bondage, the whole of his army perished in the desert.

Reforms of Peter the Great.—Peter the Great's decision to turn Russia into a Western Power demanded a complete upheaval of existing conditions. The emperor (he assumed this title in 1721 at the close of the Swedish war) carried through his reforms against a stubborn resistance of the greater part of the nation, with hardly any efficient supporters to back him. The whole of his tremendous energy was aimed at making Russia strong, and at opening her to the influence of Western science and art. He started alone in the field, and the motto he chose for his seal during his journey abroad in 1697 is most characteristic; "I am of those who must be taught and am seeking for teachers." The work he performed between 1699 and his death in 1725 is astounding. He created an army and a fleet, transformed the country's culture by putting it on a secular instead of a religious basis, made the acquisition of riches and honour dependent upon services to the State instead of birthright, and enforced justice and legality independently of the persons concerned; he developed the natural resources of the country by encouraging industries, and opened schools and obliged his subjects to travel abroad so as to learn from other nations; he fought against ancient customs and costumes, which kept the people tied up in an atmosphere where any innovation was deemed impure, manifested absolute religious tolerance and encouraged the building of Roman Catholic and Protestant churches for the foreigners whom he invited to Russia, and dragged Russian women out of oriental seclusion; he tried every branch of knowledge himself and strove to impart all he knew to his subjects; he instituted a senate, supreme court of law and highest organ of administration and offices for all branches of public service; he founded a newspaper, opened a theatre, bought works of art, made some himself, ordered geographical maps, and sent naturalists to explore Siberia. Three weeks before his death, and already in ill-health and pain, he wrote instructions for Captain Behring, commissioning him to find out whether Asia and America were separated by a sea. He composed a multitude of laws, taught people how to build houses, erect stoves, extinguish fires, bridle horses, shave beards, pray in church, and generally how to behave under every probable circumstance. Catherine II. was wont to say that whenever she saw the necessity of a new regulation she first ordered a search to be made in Peter the Great's archives, where she invariably found a draft of what she had been pondering over. He not only set a marvellous example of what personal energy can accomplish, but he was also the first to put forward the idea of "citizen" or "servant of his country," as being the highest aim of a man's activity. The real motto of his reign is contained in the order of the day he addressed to his soldiers on the eve of the battle of Poltava, the turning point in his struggle against Charles XII. of Sweden: "As for Peter, remember that life is of no value to him unless Russia lives in happiness and glory," and this formula became the leading principle of all the most representative members of his dynasty. He never hesitated to sacrifice even his only son when he saw he would undo his father's work and lead a life of ignorant self-indulgence. Later in the century Catherine II.

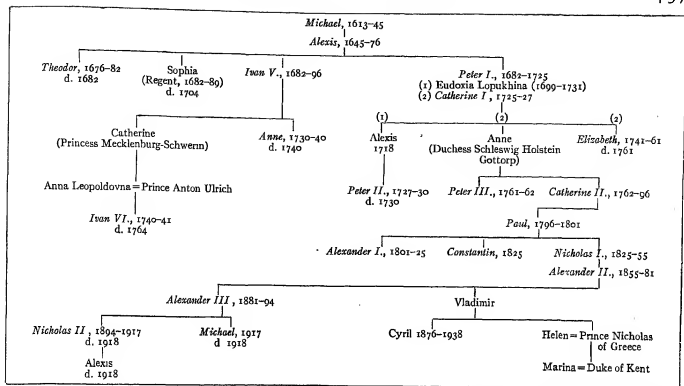

also seized every opportunity of showing that all her life and energies were devoted to the service of the country. Her grandsons, Alexander I. and Nicholas I., and her great grandson, Alexander II., proclaimed the same rule and symbolized it by always sleeping on camp-beds, with a soldier's great coat for a blanket, so as not to forget that they were ever ready to go where their duties might claim them. In this respect Peter the Great was ahead of his times, not only in Russia, but in Europe, since the first Western sovereign who prided himself on being the servant of his people was Frederick II., nearly half a century later. Peter's daughter, Elizabeth (1741-61) was also a pioneer in her way when she abolished capital punishment (1744), which from then on was not practised in Russia except in retribution for attempts to overthrow the existing order of government. She also opened a fine arts academy. The short reigns of Peter the Great's immediate successors, his widow and his grandson, during which favourites ruled in their stead, prompted a group of political men to offer the throne in 1730 to Ann, a niece of the great reformer's, but on the condition that she signed a promise to take no steps without the approval of a council of eight men (themselves) and this council would recruit its members by free election. Ann signed the paper and then, backed by the guards, destroyed it as soon as she reached Moscow for her coronation. That was the only attempt made in the 18th century for limiting autocracy in Russia.

The two 18th century sovereigns of the Romanoff dynasty whose political activity was not regulated by their sense of duty, but merely by their personal whims, Peter III. and Paul I. rapidly became so unpopular, that conspiracies at once arose which did away with them, the first after six months, the second after four years rule. The one law of Peter III.'s which it was not possible to abrogate was that which freed the members of the nobility from being obliged to serve the country, an obligation which was the only justification of the privileges they enjoyed.

Liberalism Under Catherine II.—The 34 years of Catherine II.'s reign produced a fundamental change in all paths of life. Liberal ideas, those of the French encyclopaedists, became the foundation of her reforms. She convened a commission for preparing a new code of laws and composed instructions to guide this assembly in its labours. The fundamental principles she propounded were mostly taken from the works of Montesquieu and Beccaria, but though the author of this treatise was an empress, Louis XV.'s government forbade the sale of the French edition as being too liberal. Catherine accomplished a vast number of reforms tending to economic prosperity and encouraging certain manifestations of local self-government. She did a great deal for art, protected artists and formed the nucleus of a collection which, under the name of the "Hermitage museum," is well known all over the world, and has been a powerful instrument of culture in Russia.

III. THE 19TH CENTURY

The beginning of the century saw the last of Russia's expansion in Europe, as the annexation of the Swedish province of Finland took place in 1809. The changes which occurred in the redistribution of parts of Poland and of Bessarabia, in the first half of the century, partook more of the character of frontier rectifications than conquest. Russia's territorial acquisitions of the century were mostly in Asia. In 1801 the kingdom of Georgia was annexed to Russia, and that led to a gradual absorption of Transcaucasia, the last part of which was pacified in 1864. Central Asia (or Russian Turkistan with Bokhara and Khiva), that perpetual hotbed of raids and stronghold of the slave trade, was conquered between 1830 and 1876, with the addition of the Turkomen steppe in 1831. But Russia's advance to the Black sea had opened up a new question, that of the Straits (Dardanelles and Bosphorus), for, without a free passage into the Mediterranean, the Black sea was of small commercial value. Catherine II. had obtained from Turkey the right of protection over Turkish subjects of the Orthodox faith. This new principle, akin to the more modern idea of "spheres of influence," originated the efforts of the Romanoffs for the liberation of Slav nationalities from Turk-

ish rule; Russia participated in the war for the independence of Greece and bore the greater part of the burden in those which eventually led to the creation of Rumania, Bulgaria, Serbia and Montenegro. The same policy brought on the Crimean War, which was disastrous for Russia and bared her weakness, even in military matters, before the eyes of the world. For ever since the Napoleonic wars Russian military prestige had been on a high level. Paul I.'s admiration for Prussian discipline and uniforms was inherited by his sons, and under their personal guidance the art of military parades reached such perfection that it often concealed important drawbacks of organization. The staunch qualities of the Russian soldier had left a durable impression in Europe from the time of the Napoleonic wars, but the Crimean War led to a general revaluation of Russian methods, both inside the country and abroad.

Conservatism of Later Romanoffs.—However, the main characteristics of the Romanoffs' rule in the 19th and early 20th century is undoubtedly the opposition to the principles of revolution which had triumphed in France. When Alexander I. was confronted with them, as personified by Napoleon, he was beaten, then pretended to yield till his forces were ready for a second and triumphant struggle. He realized so well the true meaning of his victory that, though the halo of "liberator of Europe" put him in a situation in which he would hardly have met with a refusal on any point, he never turned Napoleon's downfall to any merely material advantage for Russia. All he had gone through; the disasters of Jena and Austerlitz, the humiliations of Tilsit and Erfurt, the fire of Moscow, the entry into Paris, the Congress of Vienna, he used all that to enhance Russia's prestige and to create a situation where his own voice would carry most weight against revolutionary propaganda. The Holy Alliance was the only harvest he sought to reap for having led his army from Moscow to Paris.

Growth of Revolutionary Sentiment.—But this moral comfort was of short duration, and the emperor very soon perceived that he and his allies were unable to cope with the tide. Moreover, in his own country a vast conspiracy was formed, of which he was aware in the last weeks of his life, though he took no steps against it. A military revolt was organized the very moment his brother and successor came to the throne (Dec. 1825), and though it was suppressed in the course of one day, the danger he had undergone left its imprint on the whole of Nicholas I.'s

mind and behaviour. After 1848, when most European Governments gave way to political reform, the emperor of Russia remained almost the sole bulwark of legitimacy. His son, Alexander II., understood that however well the principles of his ancestors might have been adapted to the requirements of his country, they had to be exercised in conformity with the spirit of the times, and he effected a number of important reforms, such as abolition of serfdom, new courts of law with participation of a jury, local self-government (*zemstvo*) conscription for the army, education for the masses, etc. But the enemies of tsardom used these liberal measures merely as a broader basis for revolutionary propaganda, and this at once became so strong that it led to the murder of the emperor (1881).

His son, Alexander III., proclaimed his allegiance to reaction; the Constitution his father had elaborated and would have granted had he lived a few days longer, was forgotten, and a police régime was instituted which appeared to stifle a recrudescence of revolutionary activities but in reality drove them into underground channels. Outwardly, the country was quiet and prosperous. The political alliance with France, which was the personal achievement of the emperor, created an era of peace and permitted the whole force of the nation to be devoted to economic development. The building of railroads, without which no modern State can live, was bound in Russia, owing to her vast expanse, to be protracted over a much longer period than in other European countries; this work was, however, pushed on in gigantic strides; the trans-Siberian railway (due to the emperor's personal initiative) being the most notable achievement in this branch.

The last Romanoff emperor, Nicolas II., came to the throne at the age of 26, and strove to continue his father's work along the same lines. He succeeded in creating a wonderful economic prosperity. His desire to obtain a strong footing on the Pacific, and thereby to prompt the development of Eastern Siberia, led to a war with Japan (1904), which ended in disaster. A revolution broke out, and though it was suppressed by rapid and forceful measures, the emperor attempted to pacify the land by granting constitutional rights (Oct. 1905). This, however, was done but half-heartedly, and led to incessant misunderstandings between the Government and the people's representatives.

Final Success of Revolution.—Propaganda was already strong, and every liberal concession, instead of quieting public opinion, gave fresh opportunities of carrying it on. The emperor,

while well-intentioned, was scarcely strong enough in character to withstand the forces of unrest which from 1905 on became yearly more active. At last, Russia's participation in the World War and the emperor's wish to unite all classes in one effort against the enemy, cleared the ground for propaganda in the army; it was especially active in the hospitals, which were largely in the hands of volunteers. The general discontent and uneasiness produced by several years of war were put to use and a spark was sufficient for bringing on a general conflagration in the midst of which the last Romanoff emperor descended from the throne with chivalrous dignity. The three centuries of the Romanoffs' rule correspond to a period of expansion and brilliancy such as Russia had not hitherto known. (M. PAL.)

ROMANONES, ALVARO DE FIGUEROA Y TORRES, COUNT DE (1863-1950), Spanish politician, born in Madrid, Aug. 1, 1863. He was president of the Madrid municipality, cabinet minister and home secretary (1905), before thrice taking office as prime minister—in Nov. 1912; from Dec. 1915 to April 1917, and from Dec. 3, 1918, to April 15, 1919. He was minister of justice, Dec. 1922-Sept. 1923, and foreign minister, Feb.-April 1931. Later he became a leader of the right. He wrote *Las Responsabilidades Políticas del Antiguo Régimen de 1875 a 1922* (1924). He died in Madrid Sept. 11, 1950.

ROMANOS, called ὁ μελωδός, Greek hymn-writer, was born at Emesa (Homs) in Syria. He resided in Constantinople during the reign of the emperor Anastasius, probably the first emperor of that name (491-518). Having officiated as a deacon in the church of the Resurrection at Berytus, he removed to Constantinople. According to the legend, when he was asleep in the church of Cyrus, the Virgin appeared to him and commanded him to eat a scroll. On awaking (it was Christmas Day), he immediately mounted the pulpit, and gave forth his famous hymn on the Nativity. Romanos is said to have composed more than 1,000 similar hymns or *kontakia* (Gr. *kontakia*, "scroll"). The MS. of the hymns, written by his own hand, was said to have been preserved in the church of Cyrus, in which he was buried and celebrated as a saint on the 1st of October.

Editions: J. B. Pitra, *Analecta Sacra*, i. (1876), containing 29 poems, and *Sanctus Romanus Viterum Melodorum Princeps* (1888), with three additional hymns from the monastery of St. John in Patmos. See also Pitra's *Hymnographie de l'Église grecque* (1897); C. Krumbacher, *Geschichte der byzantinischen Literatur* (1897); and Hymns.

ROMAN RELIGION. The Roman people were in origin a small community of agricultural settlers, which gradually won its way to the headship first of Latium, then of Italy and finally of a European empire. Its religion, which was always marked by an absence of dogmatism and a readiness to adopt foreign ideas, has therefore a shifting and ever widening character, which tends to obscure the original essentials; the genuine Roman religion becomes gradually buried or fossilized in formal observance. The careful analysis of survivals in literature and monumental remains, and in particular of the extant calendars, has enabled scholars, using the comparative method, to make good progress in separating the elements due to different periods and influences.

Survivals.—Broadly speaking, the religion of the early agricultural settlement was arrested at the stage of Animism. It had passed beyond the primitive stages of magic and Fetichism or "Animatism," which regards natural objects as themselves divine and the source of power, and had not yet entered the stage of Anthropomorphism, which recognizes "gods" (*dei*) as personal and independent beings; it is in essence a worship of "spirits" (*numina*) which are thought of as dwelling in external objects or localities. But it is in a state of transition. There are still traces of the earlier attitude in the recognition of the sacredness of stones, such as the *silex* (flint) which played a prominent part in

the ceremonial of treaty-making, the *lapis* used in the rain-making ritual and the boundary-stones (*termini*) which marked the limits of properties. The sacred character of trees again is seen in the *ficus Ruminalis* (fig tree) and the *caprificus* (wild fig) of the Campus Martius and in the oak of *Juppiter Fereirius*, on which the *spolia opima* were hung after a victory; and the sacred animals, such as Mars' wolf, later regarded as the attributes of deities, may themselves have been originally the objects of worship. At the other end of the scale at least two of the *numina* seem already to have developed the character of anthropomorphic *dei*: *Juppiter* the sky-god, possibly an inheritance from the time before the Greek and Roman stocks had separated, and Mars, god alike of agriculture and war, and possibly in origin the "spirit" of growth in crops, cattle and the young warriors.

Animism.—But notwithstanding survivals and anticipation, Animism is the true background of the Roman religion, which might be described as a polydemonism or more exactly in Latin phraseology as a "multinumism." The "spirits" worshipped were primarily local in character: in the house they had their focuses of activity at the door, the hearth and the store-cupboard, in the countryside on hill-tops, in groves, in streams and springs. To this conception Roman religion added a characteristic or peculiar development in a kind of "Higher Animism" which associated the "spirit" not only with visible objects, but with states and actions in the life of the individual and the community: function is added to locality. Every "spirit" had thus in either a local or temporal sense or in both, its own sphere of action. The "spirits" were not conceived of in any anthropomorphic or theomorphic shape: their sex was often indeterminate (*sive mas, sive femina*, "whether male or female" was a frequent formula of prayer), they had no form of sensuous representation, nor did they need a home to dwell in: statue and temple were alien to the spirit of Roman religion. Nor could they have a personal history or relation to one another: there was no Roman mythology. But in their individual spheres they could influence the fortunes of men, and men could enter into relations with them. The primary attitude of men to the spirits was one of fear, expressed in the conception of *religio*, the sense of awe or "anxiety" in the presence of a superhuman power. But the practical mind of the Roman soon gave this relation a legal turn, and later the *ius divinum*, which regulated the dealings of men with the divine powers became a department of the *ius publicum*, the general body of civil law. The act of worship was a kind of contract: the "spirits," if they were given their due, were bound to make a return to man, and the object of worship and festival was to place them under this obligation and so to secure the *pax deum* (a state of peace between gods and men).

Ritual.—In such a religion exactness of ritual must play a large part—so large, indeed, that many modern critics have been misled into regarding the Roman religion as a mere network of formalities without any background of genuine religious feeling. This formalism shows itself in many ways. It was necessary in the first place to make quite certain that the right deity was being addressed: hence it was well to invoke all the spirits who might be concerned, and even to add a general formula to cover omissions. Place, again, was an essential element even in the conception of the *numen*, and was therefore all-important in ritual. So, too, was the character of the offering: male victims must be sacrificed to male deities; female victims to goddesses; white animals were due of the *di superi*, the gods of the upper world, black animals of the gods below; the more rustic *numina*, such as Pales (*q.v.*), should be given milk and millet cakes rather than a blood-offering. All-important, too, was the order of ceremonial and the formula of prayer: a mistake or omission or an unpropitious interruption might vitiate the whole ritual, and though such misfortunes might occasionally be expiated by the additional offering of a *piaculum*, in more serious cases the whole ceremony had to be recommenced from the beginning.

Household Worship.—In the original agricultural community, the unit both from the legal and religious point of view was not the individual but the household. The household was thus at once the logical starting-point of religious cult, and throughout

Roman history the centre of its most real and vital activity. The head of the house (*paterfamilias*) was the natural priest and had control of the domestic worship: he was assisted by his sons as acolytes (*camilli*) and deputed certain portions of the ritual to his wife and daughters and even to his halliff (*vilicus*) and his halliff's wife. The worship was offered to the spirits indwelling in the sacred places of the round hut in which the family lived. Janus, the god of the door, came first in the prayer-formulae, though unfortunately we know but little of his worship in the household, except that it was the concern of the men. To the women was committed the cult of the "blazing hearth," Vesta, the natural centre of the family life, and it is noticeable that even Ovid (*Fast.*, vi. 291-92) describes Vesta as "nought but the living flame." The Penates (*q.v.*) were the *numina* of the store-cupboard, at first vague and animistic, but later on, as the *deus*-notion was developed, individualized by selection from the other divinities of household or state religion.

Lar and Genius.—To these *numina* of the sacred places must be added two other important conceptions, that of the *lar familiaris* and the *genius*. The *lar familiaris* has sometimes been regarded as the embodiment of all the family dead and his cult as a consummation of ancestor-worship, but a more probable explanation regards him as one of the *lares* (*q.v.*; *numina* of the fields worshipped at the *compita*, the places where properties marched) who had special charge of the house or possibly of the household servants (*familia*); for it is significant that his worship was committed to the charge of the *vilica*. The *genius* was originally the "spirit of developed manhood," the *numen* which is attached to every man and represented the sum total of his powers and faculties as the *iuno* does of the woman; each individual worshipped his own *genius* on his birthday, but the household-cult was concerned with the *genius* of the *paterfamilias*. In the ordinary religious life of the family there was a more direct connection with morality and a truer religious sense than in any other part of the Roman cult. The family meal was sanctified by the offering of a portion of the food to the household *numina*: the chief events in the individual life, birth, infancy, puberty, marriage, were all marked by religious ceremonial in some cases of a distinctively primitive character. The dead, too, though it is doubtful whether in early times they were actually worshipped, at any rate had a religious commemoration as in some sense members still of the family.

From the life of the household we may pass to the outdoor occupations of the fields, where the early Roman settler met with his neighbours to celebrate in religious ceremonies the various stages of the agricultural year. Here we have a series of celebrations representing the occupations of the successive seasons, addressed sometimes to *numina* who developed later on into the great gods of the State, such as Jupiter, Mars or Ceres, sometimes to vaguer divinities who remained always indefinite and rustic in character, such as Pales and Consus. Sometimes again, as in the Lupercalia (*q.v.*) the attribution was so indefinite that it is hard to discover who was the special deity concerned; at other festivals, such as those of the Robigalia and the Meditrinalia, the worship seems at first to have been addressed generally to any interested *numina* and only later to have developed a specific deity of its own. Roughly we may distinguish three main divisions of the calendar year, the festivals of spring, of the harvest and of winter. (1) In the spring (it must be remembered that the old Roman calendar began the year with March) we have ceremonials of anticipation and prayer for the crops to come: prominent among them were the *Fordicidia*, with its symbolic slaughter of pregnant cows, addressed to Tellus, the *Cerealia*, a prayer-service to Ceres for the corn-crop, and the most important of the rustic celebrations of lustration and propitiation, the *Parilia*, the festival of Pales. To these must be added the *Ambarvalia* (*q.v.*), the lustration of the fields, a movable feast (and therefore not found in the calendars) addressed at first to Mars in his agricultural character (*see* MARS). (2) Of the harvest festivals the most significant were the twin celebrations on Aug. 21 and 25 to the divinity-pair Consus and Ops, who were both concerned with the storing of the year's produce, and two vintage festivals, the

Vinalia Rustica and the *Meditrinalia*, connected with Jupiter. (3) The winter festivals were less homogeneous in character, but we may distinguish among them certain undoubtedly agricultural celebrations, the *Saturnalia* (connected with the sowing of the next year's crop), and a curious repetition of the harvest festivals to Consus and Ops.

State Religion.—In passing to the religion of the State we enter on a later period and a more developed form of society. The loose aggregation of agricultural households gives place to the organized community with new needs and new ideals. Thus we find two prominent notes of the State influence, firstly, the adaptation of the old ideas of the household and agricultural cults to the broader needs of the city-community, especially to the new necessities of internal justice and war against external enemies; and secondly the organization of informal worship into a consistent system. Adaptation proceeded at first naturally enough on the lines of analogy. As Janus was in the household the *numen* of the door, so in the State he was associated with the great gate near the corner of the forum: the Penates had their analogy in the *Di Penates populi Romani Quirinum* by whom the magistrates took their oath on entering office, the *lar familiaris* in the *Lares Praestites* of the community, and the *genius* in the new notion of the *Genius populi Romani* or *Genius urbis Romae*. But the closest and most striking analogy is seen in the cult of Vesta. The Vesta of the State was in fact the king's hearth, standing in close proximity to the *Regia*, the king's palace; the Vestal Virgins, who had charge of the sacred fire, were the "king's daughters," and as such even in republican times were in the legal power of the *pontifex maximus*. But adaptation meant also the widening of old conceptions under the influence of reflexion. Thus, since the door is used for the double purpose of entrance and exit, the Janus of the State was represented as *bifrons* ("two-faced"): the thought of the door as the first part of the house to which one comes produces the more abstract idea of Janus as the "god of beginnings," in which character he had special charge of the first hour of the day, the calends of the month and the first month of the year in the later calendar. But development proceeded also on broader lines. Jupiter in the rustic-cult was a sky-god concerned mainly with the wine festivals and associated with the sacred oak on the Capitol. Now he developed a twofold character: as the receiver of the *spolia opima* he became associated with war, especially in the double character of the stayer of rout (*Stator*) and the giver of victory (*Victor*). As the sky-god again he was appealed to as the witness of oaths in the special capacity of *Dius Fidius*. In these two conceptions, justice and war, lie the germs of the later idea of Jupiter as the embodiment of the life of the Roman people, both in their internal organization and in their external relations. In much the same manner the agricultural character of Mars became submerged by his functions as war-god. Finally, we must notice, as the sign of the union of two settlements, the inclusion of the Colline deity, Quirinus, apparently the Mars of the originally rival community. In these three deities, Jupiter, Mars, Quirinus, we have the great triad of the earliest stage of the State religion.

Organization showed itself in the fixing of the annual calendar of festivals, the development of the character and functions of the priesthood and in a new conception of the legal relation of the gods of the State. The State now approached the gods through its duly appointed representatives, the magistrates and priests, and the private citizen was required to do no more on festival days than observe a ceremonial abstinence from work. The State religion had thus less direct connection with morality and the religious sense than the worship of the household, but it had its ethical value in a sense of discipline and a consecration of the spirit of patriotism.

External Influences.—The later stages represent not the spontaneous development of the genuine Roman religion, but its alteration and supersession by new cults and ideas introduced from foreign sources. Three periods may be recognized: (1) from the end of the regal epoch to the second Punic War—the period of contact with the peoples of Italy; (2) from the second Punic War to the end of the Republic—the period of contact with

Greece and the Orient; (3) the imperial epoch, opening with a revival of old religious notions and later marked by the official worship of the deified emperors and the wide influence of oriental cults.

Italian Influence.—By the end of the regal period Rome was a really developed city-state. There was a large artisan class, excluded from the old patrician *gens* and therefore from the State cult. At the same time the beginnings of commerce had opened relations with neighbouring peoples. The consequence was the introduction of certain new deities, the *di novensides*, from external sources, and the birth of new conceptions of the gods and their worship. We may distinguish three main influences:—

(a) *Etruria*.—The last three kings of Rome were Etruscans and Etruscan influence under their rule was strong. From Etruria came Minerva, who, as the goddess of handicraft and protectress of the artisan guilds, was established in a temple on the Aventine. Soon a new Etruscan triad, Jupiter, Juno and Minerva, was enshrined on the Capitol in a magnificent new temple built by Etruscan workmen and decorated in the Etruscan manner. In this temple the deities were represented by images.

(b) *Latium*.—Secondly, in war and peace Rome formed relations with her neighbours of Latium, and, as a sign of the Latin league which resulted, the cult of Diana was brought from Anicia and established on the Aventine in the *commune Latinorum Dianae templum*; about the same time the temple of *Iuppiter Latiaris* was built on the Alban mount, its resemblance in style to the Capitoline temple pointing to Rome's hegemony. Latin cults were introduced even inside the *pomerium*, the old city limits, the worship of Hercules, which came from Tibur in connection with commerce, was established at the Great Altar in the *forum boarium*, and the Tusculan cult of Castor as the patron of cavalry found a home close to the *forum Romanum*.

(c) *Magna Graecia*.—Later on contact with the cities of Magna Graecia brought about the wide-reaching introduction of the Sibylline books. They came from Cumae and were placed in the Capitoline temple under the care of a special commission; their "oracles," which were referred to in time of great national stress, recommended the introduction of foreign cults. In this way were brought to Rome the Greek triad Demeter, Dionysus and Persephone, who were identified with the old Roman divinities Ceres, Liber and Libera, Apollo, Mercury, and Aesculapius Dis and Proserpina, with their strange chthonic associations and night ritual. With new deities came new modes of worship: the "Greek ritual" in which, contrary to Roman usage, the worshipper's head was unveiled, the *lectisternium* (q.v.), an elaborate form of the "banquet of the gods" and the *supplicatio*, an appeal to the gods in which the whole people took part. In this period, then, we find first a legitimate extension of cults corresponding to the needs of the growing community and secondly a religious restlessness and a consequent tendency to more dramatic forms of worship.

Foreign Influence.—The two chief notes of the next period were superstition and scepticism: both the populace and the educated classes lost faith in the old religion, but they supplied its place in different ways. The disasters of the early part of the second Punic War revealed an unparalleled religious nervousness: portents and prodigies were announced from all quarters, it was felt that the divine anger was on the State, yet there was no belief in the efficacy of the old methods for restoring the *pax deum*. Accordingly recourse was had, under the direction of the Sibylline books, to new forms of appeal for the divine help, the general vowing of the first fruits (*Ver sacrum*) and the elaborate Greek *lectisternium* after Trasimene in 217 B.C., and the human sacrifice in the forum after Cannae in the following year. The same spirit continues to show itself in the introduction of Greek deities and their ready identification with gods of the old religion. Thus we hear of temples dedicated to Iuventas = Hebe (191 B.C.), Diana = Artemis (179 B.C.), Mars = Ares (138 B.C.), and even the Bona Dea (q.v.) identified with a Greek goddess of women, Demeter. At the same time cult statues are made in which the identified Greek type is usually adopted without change, with

such curious results as the representation of the *Lares* under the form of the Dioscuri. But more far-reaching still was the order of the Sibylline books in 206 B.C. for the introduction of the worship of the *Magna Mater* (see GREAT MOTHER OF THE GODS) from Pessinus and her installation on the Palatine in 191 B.C.: the door was thus opened to the wilder and more orgiastic cults of Greece and the Orient.

Oriental Deities.—After *Magna Mater* came the secret cult of Bacchus, which had to be suppressed by decree of the senate in 186 B.C., and later on the cults of Ma of Phrygia, and the Egyptian Isis were established. In all these more emotional rituals, the populace sought expression for religious feelings which were not satisfied by the formal worship of the older deities. Meanwhile a corresponding change was taking place in the attitude of the educated classes owing to the spread of Greek literature. The knowledge of Greek legends set poets and antiquarians at work on the task of creating a Roman anthropomorphic mythology. In this way grew up the "religion of the poets," whose falseness and shallowness was patent even to contemporary thinkers. But more important was the influence of philosophy, which led soon enough to a general scepticism among the upper classes.

Scepticism.—In the last century of the Republic the two later Greek schools of Epicureanism and Stoicism laid hold on Roman society. The influence of Epicureanism was wholly destructive to religion, but not perhaps very widespread; Stoicism became the creed of the educated classes and produced attempts at a reconciliation of popular religion with philosophy. Since, however, the former was regarded as untrue in itself, but a presentation of truth suited to the popular mind, the way was opened for statecraft to use religion as its tool.

The result was twofold. Worship passed into formalism and formalism into disuse. Some of the old cults passed away altogether, others survived in name but were wholly devoid of inner meaning. The old priesthoods came to be regarded as tiresome restrictions on political life and were neglected: from 87 to 11 B.C. the office of *flamen Dialis* was vacant. On the other hand religion passed into the hands of the politicians: cults were encouraged or suppressed from political motives, the membership of the colleges of pontifices and augurs was sought for its social and political advantages, and augury was debated till it became the mere tool of the politician. Little survived but the household cult protected by its own genuineness and vitality.

Imperial Religion.—The Augustan revival was largely political, a part of his plan for the general renaissance of Roman life focused no longer on the abstract notion of the State, but on the persons of an imperial house. He saw, however, that no revival could be effective which did not appeal to the religious sentiments of the populace. It was thus his business to revitalize the old forms with a new and more vigorous content. His new palace on the Palatine was to be the centre of the new popular religion. With this object he consecrated there his new temple of Apollo (28 A.C.), whom he had adopted as his special patron at Actium, and transferred to it keeping the Sibylline books, thus marking the new headquarters of the Graeco-Roman religion. Similar in purpose was his institution of the Secular Games (*ludi saeculares*) in 17 B.C. Horace's hymn written for the festival is a good epitome of Augustus's religious intentions. Further he established a new shrine of Vesta Augusta within the palace. Still more marked was the building of a great temple at the end of his new forum to Mars Ultor—Mars, the ancestor of the Julian family now to be worshipped as the avenger of Caesar's murderers. He also erected on the spot where Caesar's body had been cremated in the Forum a permanent temple to his adopted father, under the definitely religious title of *divus Iulius*. No doubt he also did much generally to revive the ancient cults; he rebuilt, as he tells us himself, 82 temples which had fallen into disrepair, he re-established the old priesthoods and filled once more the office of *flamen Dialis*. But religious feeling was now to be mainly devoted to the reigning house, and this project was aided by the natural prominence in the palace of the cult of the *genius* of the emperor himself. As the palace cults became national, the worship of the *genius* was bound to spread, and

ultimately Augustus sanctioned its celebration at the *compita* (crossways) together with the worship of the old *lares*. But here he and the wisest of his successors drew the line, and though under oriental influence divine honours were paid to the living emperor outside Italy, they were never permitted officially in Rome.

With this last period the story of the genuine Roman religion draws to a close. For, though the form of the old cults was long preserved, the vital spirit was almost gone. In the popular mind the many exciting oriental cults held undisputed sway; and with the more educated a semi-religious philosophy gave men a clearer monotheistic conception and an idea of individual relations with the divine in prayer. It was with these elements (fiercely antagonistic because so closely allied in character) that the battle of Christianity was really fought, and though, after its official adoption, the old religion lingered on as "paganism" and died hard at the end, it was really doomed from the moment when the Augustan revival had taken its irrecoverable bias in the direction of the emperor-worship.

(C. B.)

ROMANS, EPISTLE TO THE. The occasion of this New Testament epistle is revealed in 1.8f, xv 14f. St. Paul had finished his mission in Greece and was on his way to Jerusalem with the proceeds of the collection made by his churches for the poor Christians in Judea. Casting about for a new sphere, he turns to the extreme West of the Mediterranean, to Spain, where evidently no one had preached the gospel. On his way to Spain, after settling the business at Jerusalem, he proposes to visit the Christians at Rome. This corresponds to the situation outlined in Acts xx. 2f; it is probable, though not certain, that the apostle wrote the epistle from Corinth or on his way from Corinth eastward, i.e., after the Corinthian epistles. What is certain is that he takes this opportunity of stating his gospel in its width and range of appeal. In the light of his experience and in view of the fresh propaganda which he contemplated in the Western Empire, his aim is to reiterate the principles of the Christian religion as he preached it. There was an appropriate note in such an epistle being sent to Christians at the capital of the Empire. Besides, the apostle was not confronted here as, e.g., in Galatia, with any attacks upon himself by the Jewish Christian party in the Church. Hence the breadth of view and the comparative absence of controversial references. He sets himself to put forward what he regards as vital Christianity rather than to counteract any policy of his opponents at Rome, and this vital Christianity is stated in its relations to the older Jewish religion, with the object of persuading the Roman Christians, most of whom seem to have been Gentile converts, that the hopes and promises of God as revealed in the Christian gospel rest upon His previous revelation to Israel, although they go far beyond that. The two main errors before his mind seem to have been a tendency to throw over the earlier revelation and a tendency on the part of Jews to depreciate Christianity as morally inferior to Judaism. The epistle therefore is more of a treatise than any other; it does not ignore the Roman Christians, but it is not written with them constantly in view, since their local situation offered no particular problems. But, while it is a tract, it does not contain any compendium of Christianity; topics like the sacraments, eschatology, and the resurrection, for example, are not discussed as they are in the First Epistle to the Corinthians. The predominating motive of the epistle is the desire to propound the faith as a faith for all men, which has its roots in the earlier revelation of God to the Jews and yet goes far beyond that. He pours out his very soul in expounding the glory of the gospel as the

final and all-embracing revelation of God for mankind; every now and then the argument glows with passion, and the exposition thrills with the writer's joy in expressing convictions which had become for him living powers and hopes.

The outline of the epistle is as follows. After apologizing for his inability to visit the Roman Christians before now, he promises to visit them, bringing "some spiritual gift" to this world-famous church of the capital. Meantime he explains the gospel of which he is so proud, endeavouring to stir up his readers to a sense of its wonder and strength. Such is the theme of the first five chapters, God's "righteousness" or salvation for faith offered in Jesus Christ to all men, apart from national restrictions. To be right with God, to enjoy His fellowship and favour, is a position which is His gift. Both pagans and Jews have hitherto missed it, but in Jesus Christ (iii. 21f) it is now brought within reach of all men, as they believe. Not that faith and revelation had been absent from the earlier history of God's people; the apostle shows that this was implicit in the religious experience of Abraham (iv.). Only, it required the divine revelation in Christ to overcome the sin of man, which had weakened the race hitherto (v. 11). From a philosophy of history he is now passing to the deeper experience of religion, and the magnificent sweep of the next passage (vi.-viii.) shows how this faith embodies the power of receiving and realising the gift of God, since it invests man with the divine Spirit, which is the sole guarantee of a sound life in the present and of a secure life in the future.

Reverting to history, he now (ix.-xi.) faces the problem of the Jewish nation's antipathy to the gospel, seeking to reconcile this with the justice and promises of God in the Old Testament. God is not to blame for such unbelief, he argues. And, with patriotic pathos, he hopes it will not be final; the rejection of Christ by the Jews, he contends, is merely partial and temporary. But part of his interest is to prevent Gentile Christians from depreciating their relation to God's earlier revelation in Israel and from disparaging the historical link between themselves and the saving purpose of God in the world. All men are equally under the sweep of God's marvellous mercy, he concludes, in an impassioned outburst (xi. 25-36).

Such an experience of the divine mercy brings obligations in its train, however, and these are now outlined (xii.-xiii.) as they bear upon the conduct of Christians as members of the Church, of society, and of the State; love is the supreme law, and as the Day of the Lord is near, there is no time for indulgence in vice. "It is high time to wake up." But, instead of dwelling on this motive, he proceeds to apply the law of Christian love to one special problem of contemporary ethic, viz., the strain set up between the narrower and the more liberal parties over total abstinence and vegetarianism (xiv.-xv. 13), pleading for consideration on the part of the liberal majority, and finally calling on all alike to glorify God for His mercy to them in Jesus Christ.

Such is the outline of the epistle as a whole. It is not unfair to suggest that faith dominates the first part (i.-v.), hope the second (vi.-viii., ix.-xi.), and love the third (xii.-xv.), though none of the three is ever isolated entirely from the others. The epilogue (xv. 14-33) reverts to the situation noted in the opening paragraph; the apostle tells them of his plans and asks for their prayers.

The sixteenth chapter seems to contain a note intended for a different audience. It is possible that the apostle may have known a number of Christians who had found their way to Rome, but the probability is that the first part of this chapter (1-16, 1-20, or 1-23), represents a letter of commendation for Phoebe, addressed to the church at Ephesus. The number of personal references and the unusual wealth of detail point to some community with which St. Paul was more familiar than he could be with the Roman church. Ephesus answers this requirement better than almost any other sphere; besides, the sharp warning against errorists in verses 17-20 applies to Ephesus at this period (1 Cor. xvi. 8-9, Acts xx. 29f), better than to what we know of the Roman church, for it is improbable that the apostle meant the words to be a vague warning against something that might happen in the future. For these reasons many editors and critics detach xvi.

from the original Roman epistle.

The tone and style of xvi. 25-27 suggest also that it is an editorial addition, later than St. Paul. Indeed in some early copies of the epistle during the second century it is found after xiv. 23, perhaps in editions drawn up for reading in worship. This is merely one of a number of textual phenomena, which are discussed fully in Lake's *The Earlier Epistles of St. Paul* (pp. 335f.), in Lightfoot's *Biblical Essays*, in Zahn's *Einführung in das Neue Testament* (section 22), in Westcott and Hort's *Greek New Testament* (appendix), and in the present writer's *Introduction to the Literature of the New Testament* (pp. 134f.), as well as by the critical editors. Some early editions of Romans seem to have omitted the words "in Rome" at i. 7 and 15. Unless this was due to a desire to make the epistle a catholic document, or to Marcion's revision, it may point to the fact that there were more than one edition of the epistle. Lake, for example, argues on textual grounds that Paul himself wrote an edition, without "in Rome," consisting of i. 1-14, xiv. 23, v. 25-27, as a companion letter to Galatians, and that later he edited the epistle as we have it for the special purpose of instructing the Roman church. Others, like Renan (*St. Paul*, pp. 461f.), think of two editions, the first (i.-xiv., xvi. 1-20) intended for Asia or Ephesus, the second for Rome—a hypothesis which assumes a variety of forms. But it is not easy to suppose that the apostle ever left xiv. 23 with xvi. 25-27 as a self-contained letter, even if the doxology be accepted as Pauline. It is fairly clear that the canonical epistle represents an edited form of the original, and one natural hypothesis is that the original ended with xv., whilst xvi. 1f. contains an addition. As Deissmann points out, the papyri supply numerous analogies for a "letter of commendation plunging at once in *medias res* and beginning with 'I commend'" (*Light from the Ancient East*, p. 235); and if Tertius wrote both, the smaller letter might be put in the wake of the larger, as the canonical editors drew upon the copybook in which both were preserved. The mechanical conditions for such a practice are discussed in Gregory's *Canon and Text of the New Testament* (pp. 196f.).

It is no longer necessary to discuss theories that the whole epistle is a later forgery: Schmiedel's examination of this aberration (in *Hibbert Journal* i. 521f.) sufficiently indicates the impossibility of taking such views seriously. Nor is it needful to criticize the theories which attribute xv.-xvi. in whole or part to some later hand, much less the idea, voiced recently by H. Delafosse (*L'Épître aux Romains, traduction nouvelle, avec introduction, notes et commentaire*, Paris, 1906), that the canonical Romans represents an originally Pauline letter which was first edited by Marcion and then catholicized. The epistle as it stands was known early to writers of the second century like Justin and Polycarp, possibly even to Ignatius; indeed traces of it are to be found in the epistle of Clemens Romanus, which lies within the last decade of the first century, at the very latest (see for an even earlier date, G. Edmundson's *The Church of Rome in the First Century*, 1913, pp. 141, etc.).

BIBLIOGRAPHY.—The latest editions of modern days are those by B. Weiss in Meyer's *Commentary* (9th edition, 1899), R. A. Lipsius in the *Handcommentary* (1892), Sanday and Headlam (*International Critical Commentary*, 5th ed. 1905), Denney (*Expositor's Greek Testament*, 1902), Lietzmann in his own *Handbuch* (1906), Farrar (*Cambridge Greek Testament*, 1912), E. Kuhl (1913), P. Lagrange (Paris, 1916), and Hauck in Zahn's *Commentary* (1912), although the older work of men like Götze (1879, Eng. Tr. 1888) and E. H. Gifford (in the *Speaker's Commentary*, 1881) deserves attention still for its delicate express. Lightfoot's posthumously published notes do not go beyond vol. 25 (*Notes on Epistles of St. Paul*, 1898), but we have Hort's invaluable *Romans and Ephesians* (1895) for a study of the general data of the epistle, as well as the chapters in Kirsopp Lake's *The Earlier Epistles of St. Paul*, Lidson's *Explanatory Analysis* (1893), Pfeiderer's *Primitive Christianity* (vol. i. pp. 211f.), G. Semler's *Il pensiero di S. Paolo nelle lettere ai Romani* (Rome, 1903), and J. Drummond's article in the *Hibbert Journal* (1913, pp. 371f.). The critical movements are chronicled by C. Clemens in his *Paulus* (i. pp. 85f., ii. 238f.), and by A. Robertson in Hastings' *Dictionary of the Bible*, iv. 205f. and C. W. Emmett (*Dictionary of the Apostolic Age*, ii. 408f.). The first chapter of Matthew Arnold's *St. Paul and Protestantism* discusses Romans, and Sievers has just published an edition in rhythmic form, in the first volume of his *Paulinische Briefe, hänglich untersucht und herausgegeben* (Leipzig, 1926). (J. Mor.)

ROMANSHORN, an important commercial town in the Swiss canton of Thurgau, on the west shore of the lake of Constance. By rail it is 5½ m. N.E. of Zürich. In 1950 its population was 6,648, mostly German-speaking. In 1930 there were 4,535 Protestants and 1,898 Roman Catholics. Originally a small fishing village, it belonged to the abbot of St. Gall from 1432 to 1708, when it became part of the canton of Thurgau. In 1856 the railway from Romanshorn to Zürich was opened, and this vastly increased the commercial importance of Romanshorn. Its position on the lake helps to make it the centre of a great transit trade, chiefly in corn and timber, and it has many industrial establishments.

ROMANS-SUR-ISÈRE, a town of southeastern France, in the department of Drôme, 12½ m. N.E. of Valence on the railway to Grenoble. Pop. (1906) 22,171. Romans stands on a height on the right bank of the Isère, a bridge uniting it with Bourg-de-Péage (pop. 6,018) on the other side of the river. The present parish church belonged to an abbey founded in 837 by St. Bernard, bishop of Vienne.

Romans has a tribunal of commerce. Its industries include tanning, leather dressing and shoemaking, distilling and oil-refining.

ROMANUS, the name of four East Roman emperors.

ROMANUS I (Lecapenus), who shared the imperial throne with Constantine VII (q.v.) and exercised all the real power from 919 to 944, was admiral of the Byzantine fleet on the Danube when, hearing of the defeat of the army at Achelous (917), he resolved to sail for Constantinople. Soon after the marriage of his daughter Helena to Constantine he was crowned colleague of his son-in-law. His reign, which was uneventful, except for an attempt to check the accumulation of landed property, was terminated by his own sons, Stephen and Constantine, who in 944 compelled him to become a monk. He died in 948.

ROMANUS II succeeded his father Constantine VII in 959 at the age of twenty-one, and died—poisoned, it was believed, by his wife, Theophano—in 963. He was a pleasure-loving sovereign, but showed judgment in the selection of his ministers. The great event of his reign was the conquest of Crete by Nicephorus Phocas.

ROMANUS III (Argyros), emperor 1028-1034, was an distinguished Byzantine patrician, who was compelled by the dying emperor, Constantine VIII, to marry his daughter Zoe and to become his successor. He showed great eagerness to make his mark as a ruler, but was mostly unfortunate in his enterprises, and in his endeavour to relieve the pressure of taxation disorganized the finances of the state. In 1030 he resolved to retaliate upon the incursions of the Moslems on the eastern frontier by leading a large army in person against Aleppo, but sustained a serious defeat at Azaz near Antioch, after which he never recovered popularity. His early death was supposed to have been due to poison administered by his wife.

See J. B. Bury in the *English Historical Review* (1889), pp. 53-57; G. Schlumberger, *L'Époque byzantine* (Paris, 1905), iii. pp. 56-158.

ROMANUS IV (Diogenes), emperor 1068-1071, had risen to distinction in the army, when he was convicted of treason against the sons of Constantine X. He was pardoned, however, by the empress Eudocia, whom he subsequently married. After his coronation he carried on three successful campaigns against the Saracens and Seljuk Turks; in a fourth he was disastrously defeated by Alp Arslan on the banks of the Araxes and taken prisoner. After releasing himself by the promise of a large ransom and the conclusion of a peace, he turned his arms against the pretender Michael VII, but was compelled after a defeat to resign the empire and retire to the island of Prote, where he soon died in great misery. It was during this reign that the surrender of Bari (1071), the Byzantine empire lost its last hold upon Italy.

See J. J. C. Anderson in the *Journal of Hellenic Studies* (1897), pp. 36-39. On all the above see also J. B. Bury's edition of Gibbons, *Decline and Fall of the Roman Empire*.

ROMANY LANGUAGE. The strongest proof that the gypsies came originally from India is found in their language.

For all its dialects are clearly Indo-Aryan, that is to say, modifications of the language from which have sprung all the Aryan languages of modern India and Ceylon, and of which Sanskrit, with its oldest document the *R̥gveda*, is the literary expression. Moreover, gypsy is not only derived from the same original source as the other Aryan languages of India, but must for many centuries after the Vedic age have shared their development within or near the borders of India. For in general it shows the phonetic and grammatical changes which the Indian languages as a whole did not reach long before the beginning of the Christian era.

Dialectal Position.—The question in which dialect-group of these languages gypsy had its origin has been much discussed. One school holds that it belongs to the north-western and especially to the Dardic, which comprises certain dialects of the Hindu Kush and includes also the more important Kashmiri. These languages, in some respects more conservative than those further in India, have kept certain features of the old Sanskrit sound-system unchanged, e.g., the preservation of two or more sibilants (*ś*, *ṣ*, *ṣ*) or of an *r* preceded by a consonant. The gypsy dialects also show some of these peculiarities. But the preservation by descendants of characteristics that existed in the parent language is not proof that they have any specially close relationship (other than common origin). The existence of the same early innovations in both is proffered by those who hold that gypsy belonged originally to a more central group of dialects, of which a typical modern representative in India is Hindi. It is with these it shares its earliest sound-changes. Gypsy does not, however, share other later innovations of the central group which had set in or were setting in at the time of Aśoka (c. 250 B.C.). They must, therefore, have severed their relations with this group before that date. The word *rom*, "Gypsy man," south-east European *rom*, Armenian *gy. lom*, Palestinian *gy. dōm*, is the same word as the Skt. *ḍombā*, "a low caste of dancers and singers," from whom the *Dōms* of India also derive their name. It is probable that wandering tribes, perhaps of the same character as some of the criminal tribes of modern India, speaking a central dialect, made their way to the north-west (probably western Panjab or Peshawar district) before the middle of the 3rd century B.C. There, among speakers of the north-western dialect-group, they stayed until, at some time before the 6th century A.D., they left India behind them in a migration which spread them all over western Asia, Europe and even America.

Dialects.—It is not known whether the gypsies left India in one or several separate migrations or whether there were even at that time marked dialectal variations in the language they spoke. But at the present day there are at least three distinct groups of dialects, the Asiatic, the Armenian, and the European. One of the most noticeable differences lies in the treatment of the original voiced aspirates of Sanskrit. The Asiatic dialects have either preserved these or, losing the aspiration, have reduced them to simple voiced sounds; the European and Armenian dialects, on the other hand, have changed them to surd aspirates: Skt. *bh*, *dh*, *gh* become Asiatic *b*, *d*, *g*, but Armenian and European *ph*, *th*, *kh* (*ḥ*, *ḥ*, *ḥ*). Thus we find Skt. *bhrāta* "brother," *dhūmāḥ* "smoke," *ghṛīṣm* "melted butter" in Eur. *gy. p'ra*, *t'um*, *k'id*, in Pal. *gy. bar*, *dif*, *gir*.

To-day there is considerable dialectal variation even within a single group such as the European, dating probably from the time of separation within Europe itself. These dialects differ according to locality and to the degree in which they have been influenced by surrounding languages. In this respect they may vary from the comparatively pure Indian idiom of, for example, some of the Balkan gypsies or even of the gypsies of Wales, to mere jargons consisting of a framework of the local language, for example, English, in which a certain portion of the vocabulary is replaced by gypsy words.

Sounds.—The vowel-system rests on that of Sanskrit. As in all Middle Indian dialects Skt. *ai* and *au* have become *ē* and *ō* (e.g., Arm. *gy. tē*, "oil," from *tāilām*; *ol*, "price," from *mauliyam*). In the European dialect Skt. *a* in an open syllable appears as *e*.

but in an originally closed syllable as *a*, which is also the representative of Skt. *ā*: *merd*, "dies," *raḥ'd*, "keeps," *manuṣ*, "man," from *māraṣ*, *rāḥyati*, *mānuṣāḥ*.

In the consonant-system, the chief innovation is the change of the voiced aspirates already mentioned. Of the surd aspirates, *ph* appears to remain (*p'al*, "board" from Skt. *phalāḥ*); *ch* loses its aspiration in west European gypsy (W. Eur. *tin*, "to cut," S. E. Eur. *t'im* from Skt. *chināḥ*); *kh* perhaps becomes a spirant *x* (*xanro*, "sword" from Skt. *khaṇḍakāḥ*). Intervocalic consonants, as in all other descendants of Sanskrit, are weakened. The gutturals and palatals disappear altogether; the cerebrals remain as *r* (S. E. Eur. *r*), the labials partly as *v*, the dentals as *l* in the European and Armenian dialects and as *r* in the Asiatic.

Sanskrit	Gypsy	Sanskrit	Gypsy
<i>yāhā</i> "louse"	<i>juw id.</i>	<i>āgataḥ</i> "came"	<i>alo id.</i>
<i>śāl</i> "needle"	<i>siw id.</i>	<i>vijayati</i> "bears young"	<i>benel id.</i>
<i>kūḍh</i> "insect"	<i>kiri</i> "ant"	<i>bhidālāḥ</i> "cat"	<i>blāri</i> (Syr.) <i>id.</i>
<i>śūpāyati</i> "places"	<i>t'owel id.</i>	<i>pāṭati</i> "drinks"	<i>picid id.</i>
<i>yuvatiḥ</i> "young woman"	<i>juwel id.</i>	<i>hrdayam</i> "heart"	<i>yelo id.</i>
	<i>jūār</i> (Syr.)		<i>hri</i> (Syr.)

Assimilation of consonant-groups has occurred generally, with the exception of *r* preceded by a stop and of sibilants followed by dental or cerebral stops (except in the Armenian dialect).

Sanskrit	Gypsy
<i>duḥghān</i> "milk"	<i>t'ud</i> (from <i>duddhāni</i>), Arm. <i>lūt</i> .
<i>bhrāta</i> "brother"	<i>p'al id.</i> , Arm. <i>p'al</i> , Syr. <i>bar</i> .
<i>hastāḥ</i> "hand"	<i>vost</i> , Syr. <i>hāt</i> , Arm. <i>ai</i> .

Grammar.—In grammar, too, the main structure of the better preserved dialects rests upon its Sanskrit original. The declension of the noun is based on two cases—a direct (descended from the Sanskrit nominative and accusative) and an oblique (descended from the Sanskrit genitive) to which various postpositions can be added.

	Sanskrit	Prakrit	Gypsy
Sing. nom.	<i>cārāḥ</i> (-ā)	<i>cārā</i>	} <i>ḥor</i>
acc.	<i>cārām</i>	<i>cārām</i>	
gen.	<i>cārāṣya</i>	<i>cārāssa</i> (-asa)	
Plur. nom.	<i>cārāḥ</i>	<i>cārāḥ</i>	
gen.	<i>cārāḥām</i>	<i>cārāḥām</i>	<i>ḥorām</i>

The verb is built up of the old present stem, of which the indicative, the imperative and the participle still survive, and of the past participle, which alone or combined with auxiliaries forms past tenses.

	Sanskrit	Gypsy
Present indicative: Sing.	<i>rākṣāmi</i>	<i>rak'sm</i>
	<i>rākṣasi</i>	<i>rak'si</i>
	<i>rākṣati</i>	<i>rak'se</i>
Plur.	<i>rākṣāmasi</i>	<i>rak'sam</i>
	<i>rākṣathana</i>	<i>rak'sen</i>
	<i>rākṣanti</i>	<i>rak'sen</i>

The opposition between present stem and past participle, though in most cases the latter has been remodelled on the former, still survives in a few verbs:

[Skt. <i>māraṣ</i> "dies": <i>māṣ</i> "dead" = Cy. <i>merel</i> : <i>mulo</i> .
„ <i>yāti</i> "goes": <i>gaitā</i> "gone" = „ <i>jāl</i> : <i>gelo</i> .

Gypsy has preserved the Sanskrit numerals 1 to 6, 10, 20, 100. But 7, 8, 9 and higher numbers are borrowed—by Asiatic generally from Persian, by European from Greek—or are formed by various methods of addition or multiplication from existing numerals.

The borrowing of vocabulary has been extensive. The first examples can be dated back to the time when, leaving the central group of dialects in India, the gypsies sojourned among the speakers of the north-western group. Indeed, the borrowed words of a gypsy dialect disclose the itinerary of its migrations. When in the dialect of the gypsies of Wales we find borrowed words from Persian, Armenian, Greek, Rumanian, Bulgarian, Serbian, Czech, German, French and English, we may assume that at some time or other the ancestors of this particular group passed through the countries where these languages were spoken. The form in which the words appear may give some clue as to the date when they were borrowed. The most numerous source

for the European dialects is Greek, a fact which accords with the long stay the gypsies appear to have made in the Eastern empire.

ROMBLON, a municipality, capital and port of the province and island of Romblon, Philippine Islands, about 187 mi. from Manila. It has a deep well sheltered harbour which makes it one of the best ports south of Luzon. Pop. (1939) 14,309; 13 were white. The exportation of copra is extensive. Ornamental buri mats are made there. Cebuano is the vernacular. Of the inhabitants aged 6 to 19 inclusive, 32.4% attended school in 1939, while 42.2% of the population 10 years old and over was literate.

ROME, a province of modern Italy, forming a part of the district of Latium (Lazio) (q.v.).

ROME, the capital of the kingdom of Italy, lies on the Tiber river, 17 m. north-east from its mouth on the Mediterranean. It was the capital of the ancient Roman republic and of the Roman empire and became very early the headquarters of the Christian Church. With a longer record of continuous political and religious importance than any other city it is unique for its antiquarian interest. In the following account the general subject of Rome is treated broadly under two aspects, themselves subdivided. These are: (1) the topography and growth of the city of Rome, the evolution of which is traced from the earliest times to the present, and (2) Roman history, i.e., the political and social history of the Roman republic, empire, the mediæval commune, and briefly the modern Rome.

THE ANCIENT CITY

The primitive city of Rome stood not in the Tiber valley, but on the ridges—so-called hills—of the Latin plain that jut unevenly into the valley. During the empire the city encroached more and more on the lower level till it covered the whole of the Campus Martius that lay in the wide bend of the river opposite the Vatican hill. These ridges, like the whole Latin plain, consisted of volcanic ash, partly cemented into hard tuff, which had, during a long series of eruptions in the Alban hills, filled an inland lake and built up an uneven plateau. In drilling wells outside of Rome's gates the following strata, enumerated from top to bottom, are usually pierced: several layers of brownish ash or tuff, a stratum of caprellaccio or friable grey tuff mixed with alluvial sediment, sand and gravel of the former lake bottom, and finally pliocene clay. Where erosion has not been very active the volcanic deposit near Rome rises to about 70 feet. Nearer the Alban hills it is far deeper. Here and there drilling also encounters hardened streams of lava that flowed from the craters from time to time. The Applan way lies partly upon a tongue of hard lava that flowed northwards during one of the last eruptions, not long before historic times.

The First Settlements.—On the part of Latium covered by the ash deposits we have as yet no convincing proofs of human settlements prior to the early iron age (about 1000 B.C.), whereas on the calcareous areas of Latium—on the Sabine and Volscian hills—which this ash did not reach, numerous remains even of Neolithic settlements have been found. It would seem that the site of Rome (and its neighbourhood on the south and east) was not an attractive place for settlement until about 1,000 years before our era, and the cause may well have been the activity of the Alban volcanoes. The first settlers coming from north of the Tiber seem to have taken possession first of the Alban hills and then of the Roman "hills." They were apparently shepherd and agricultural peoples of the "Italic" branch of the Indo-European race, related to the Villanovans (q.v.) who were settling in southern Etruria at the end of the second millennium B.C. The highest and

safest points (the Palatine hill, probably the Capitoline and the outlying spurs of the Esquiline) seem to have been chosen for the first communities. The graves of these early people that have been found in the Sepulchrum at the edge of the Forum show that they were a cremating folk that possessed the same kind of utensils and pottery that have been found in the Alban cemeteries. About the 8th century a related people, which however buried their dead, came in from the older settlements of the Sabine hills and built their straw huts on the Esquiline and Quirinal ridges. In the 6th century Etruscan princes seem to have conquered the whole of Latium. They soon organized these communities (which had apparently coalesced to some extent) into a city, and, bringing it into connection with the rapidly growing Etruscan cities north of the river, laid the foundations of a flourishing principality. Before they were driven out, about 500 B.C., a large temple had been built to Jupiter, Juno and Minerva on the Capitoline, a stone wall had been raised enclosing all the hill communities, and the forum valley had been drained so that the area could be used as a common market place.

In early Rome ordinary dwellings were straw huts or straw-thatched adobe huts, while temples and public buildings were erected in the Etruscan manner to suit the materials of the vicinity. The Capitoline temple, for instance, had walls of volcanic tuff well coated with stucco to hide the ugliness of the material. The ceiling beams which supported a tile roof were probably held up by a cantilever brace. The roof of the portico rested on four tuscan columns of wood or stuccoed tuff. The wooden architraves were covered with figured terra-cotta slabs that provided some adornment and protection for the beams. The pediment figures were also of terra-cotta. Because of the absence of good building stone the Etruscans early developed for architectural adornment a dignified plastic art in terra-cotta, and its artistic qualities can now be appreciated in the splendid Apollo-figure recently discovered in Veii, a few miles north of Rome. This Etruscan method of building sufficed for the city till Greek artists were brought to Rome in the second century B.C. The building of stone bridges and aqueducts during the 2nd century popularized the use of the stone arch. The concrete dome which became so striking an element in later Roman construction was not used to good effect till the latter part of the 1st century of the empire when the art of making reliable concrete had been fully developed.

Materials.—Since public buildings were frequently rebuilt and enlarged it is difficult to assign the present remains to their proper epoch, and the accounts of early Roman architecture do not by any means agree as to dates. It is only by careful observation of the materials¹ used that we can assign the remains of the republican period to their approximate periods. Before the Gallic fire in 387 B.C. practically the only stone used was the soft grey volcanic tuff called caprellaccio, the principal source of which was the quarry at the foot of the Capitoline where the Mamertine prison now stands. This is a very poor weathering stone so that it was regularly protected by a coat of stucco when used above ground. After the Gallic fire, when Rome had gained possession of the Volturnian quarries of Grotta Oscura near the Tiber some 10 m. north of the city, the yellowish grey tuff of that region came into popular use. This stone was as easily worked as the native one, and being more uniform in texture was cut into larger blocks of 22 ft. The massive fortification walls of Rome were largely rebuilt of this material during the 4th century, as were many of the public structures that had been destroyed by the Gauls. For rough work some very ugly volcanic stone, full of inclusions of black scoria, was also used for a while. This was also found in southern Etruria, and the blocks that were used at Rome and Ostia may have come from the abandoned walls of Fidenæ, north of Rome. The grey tuff of Grotta Oscura was the favourite building stone of the city for over 200 years, while the scoria-filled stone was soon abandoned.

These materials also weathered poorly and proved too weak for

¹Middleton, *The Remains of Ancient Rome* (1892); Lanciani, *Ruins and Excavations* (1897); Delbrück, *Hellenistische Bauten* (1907); Van Daman, *The Date of Concrete Monuments* (1912); Frank, *Roman Buildings of the Republic* (1924).

heavy loads. Hence in the 3rd century architects went to the Alban hills for the stronger dark grey tufa (*Lapis Albanus, peperino*) when in search for architrave beams and heavy column drums. The Tullianum, Rome's first prison, which required a very hard stone, seems to be the first structure built of this material. It probably was constructed about 250 B.C., certainly not in the regal period as has been supposed. All the large temples built during the 2nd century A.C. used peperino for points of great stress and weight. At the Sabine lake, an old volcanic crater which was nearer Rome, a tufa somewhat rougher than peperino, but equally strong, was then brought into use. This Sabine stone (*Lapis Gabinus, sperone*) was freely employed in massive walls for a century or more, but its use was limited by the fact that it would not yield to ornamental cutting. Both of these stones were costly because of the heavy transportation charges. Hence during the 2nd century experiments were made with the brown tufas nearer Rome. As can still be seen, the hills of Rome had an abundant supply of this brown tufa lying above the caprellaccio, but these hills were now so well covered with buildings that quarrying inside the city was impracticable. South of the Janiculum, on Mt. Verde, a quarry was opened and used for several buildings of the second century and of the early decades of the first. The Mt. Verde stone is hard, close-grained, but too brittle for heavy burdens, and was seldom used after Sulla's day. The brown tufa from the Anio river just above Rome proved to be very strong and uniform, in fact an excellent material except for its ugly appearance. After the fine arches of the Aqua Marcia were built of it in 144 B.C., it remained because of its durability and cheapness the favourite stone for ordinary ashlar masonry for two centuries. This Anio tufa is now to be found in the ruins of more than half of the buildings of the forum. During the 2nd century B.C. two very important discoveries of materials were made. The travertine deposits at Bagni on the road to Tivoli were found. This is a limestone of recent formation caused by the deposit of the carbonate of lime from the hot springs that arise at that point. Since the ground was level and covered with vegetation the splendid deposit had for centuries lain unobserved. The stone being rather soft when at first exposed is easily sawed and worked. It soon hardens under exposure. The Romans used it at first with some hesitation, but by Caesar's day they had learned to appreciate its good qualities. During the early empire it was freely used, as may be seen in the massive walls of the Colosseum. Recently this stone has been exported in large quantities to America.

Unfortunately for the aesthetic qualities of Roman architecture the process of making a cheap and durable, though ugly, concrete was discovered at about the same time. Since good sand is difficult to find near Rome, volcanic ash (*pozzolana*), which lies in abundance everywhere in Latium, was substituted. This ash is of course a crushed dehydrated slag, and it was eventually found that if the ash was taken from deep pits where rain-water had not destroyed its qualities it would mix with lime into a very firm hydraulic cement. By adding a filler of tufa fragments a very cheap and durable concrete could thus be made. Concrete was first used freely in the foundations and podia of the temple of Concord in 120 B.C. and the temple of Castor in 117 B.C., but it is found even earlier in a part of the platform that was constructed in front of Castor several years before. This platform probably belongs to the Gracchan period. Concrete however came into free use in superstructures only in the age of Caesar, when marble was imported in such abundance that it could be used as a veneer for ugly concrete walls. The great importance of concrete for Roman architecture lay in the fact that during the empire, when Rome required very extensive structures, domes and vaults of immense span could be built of this material. During the empire most of the heavy walls were constructed of concrete because of its cheapness and durability. They were usually faced with brick or with marble slabs. The bricks when used were generally triangular with one angle stuck into the concrete; the marble slab veneering was usually held in place by iron clamps.

Though the art of making good terra-cotta ware was known in primitive Rome, and roof-tiles of terra-cotta of excellent quality had freely been used for six centuries before Augustus' day,

bricks were not burned at Rome for use in wall-construction during the republic. Immense heaps of fragments of broken roof-tiles had however accumulated, and the Augustan architects began to use these fragments in facing concrete walls. When this supply gave out, triangular bricks were made for the same purpose—during the reign of Claudius—and when, after the great fire of Nero's day, a vast programme of rebuilding followed, brick yards turned out an immense quantity of material for the facing of concrete walls. This material continued to be used freely through imperial times.

Marble was very expensive and relatively few buildings were made of solid marble; but for veneering, for columns, entablatures and decorative members large quantities of marble were imported. A few wealthy nobles had imported marble columns for their porticoes before Caesar's day. While Caesar was governor of Cisalpine Gaul his architects and engineers began to import to Rome Carrara marble, found in that province. The architects of Augustus developed the Numidian quarries of Simitthub, which yielded a variety of yellow and cream coloured marbles of great beauty (*giallo antico*). The transportation costs were very heavy since it had to be brought room over land before it was loaded on ships. Its use was largely confined to decorative purposes. The pavonazetto of Synnada, 2000 in. from Smyrna in Asia Minor, also came into use, as well as the greenish cipollino of Euboea, the marbles of Pentelicon, Hymettus and Faros, and the red granites of Aswan in Egypt. During the empire architects vied with each other in attaining new colour effects with contrasting veneers, and the Christian basilicas and churches of Rome which are decorated with the marbles stripped from Roman buildings are rich with stones that the emperors had imported from all parts of the world. Besides those mentioned we may name the products of quarries of Chios (called *Africano*), Thasos (*porta santa*), Laconia (*rosso antico* and *nero antico*), Thessaly (*verde antico*), and the alabasters and porphyries of Egypt.

Early Town Walls.—Tradition speaks of very early fortifications around the Palatine and Capitoline hills. These may have been earthen mounds bearing a fence of stakes. There is no doubt that a stone wall was constructed of caprellaccio blocks around the whole city at the time of the Etruscan kings. This wall was almost wholly rebuilt after the Gallic fire (387 B.C.) with the stronger Grotta Oscura stone, and later strengthened and improved from time to time with better materials. This so-called Servian wall (at first not including the Aventine) was nearly 6 km. long. It began at the Tiber near the present Ponte Rotto, had two gates between the Tiber and the Capitoline hill, skirted the Capitoline on its west side (where a few blocks of the 4th-century wall are visible), then proceeded across the valley to the edge of the Quirinal hill. A small gate (perhaps an embrasure for artillery) is still visible inside the Palazzo Antonielli, but this consists of Anio tufa and must date from about the time of the first civil war. The fragment of wall seen in the via Nazionale just above is of Grotta Oscura stone belonging to the 4th century. From this point the wall followed the edge of the Quirinal hill north-eastwards for over a mile to the porta Collina. At the via Finanzze may be seen a well preserved portion in caprellaccio. Because of the material this part has usually been assigned to the 6th century, but the fine workmanship and battering would rather indicate a 4th century reconstruction. From the Porta Collina the wall turned southwards across the level plateau to the porta Esquilina, a distance of about a mile. Here the city was especially exposed to attack and the wall was not only made with special care in the 4th century but was later frequently strengthened and repaired. In constructing this portion a moat 30 ft. deep and 200 ft. wide was dug and the earth of this excavation was used for an agger about 40 ft. thick. The stone wall itself that stood behind the moat and supported the mound was about 10 ft. thick and more than 30 ft. high and was made of Grotta Oscura stone. The inner side of the agger was supported by a lower caprellaccio wall. The numerous quarry marks found in the section near the railway station are probably those of the Etruscan workmen of the 4th century, while those found at Piazza Fanti seem to belong to the repairs of the second Punic War. The Sabine and Monte Verde stones of the reconstructed

Viminal gate may belong to the time of the Social War, while the concrete work and Anio stone at Piazza Marzio seem to be a part of the repairs made during the Catilinarian Rebellion or the civil war.

The original wall skirted the Palatine hill on the south side and ran directly to the river. Here several portions of the 4th-century wall, built in Grotto Oscura tufa and the scoriated Fidenae stone, have been found, but at the south-west corner of the hill a fragment of the original 6th-century wall in capellaccio blocks may still be seen. During the 4th century the Aventine was also included in the fortifications. The large wall on the Via di porta S. Paolo, however, was repaired with Anio stone and a concrete backing during the Sullan period, and near the gateway arched openings for the placement of defensive artillery were neatly constructed.

Streets.—It is doubtful whether Rome had paved streets before the 2nd century B.C. The earliest pavement that has been found is that of the street which ascends the Capitoline hill from the forum. It was laid in 174 B.C. The few remains of it still visible at the side of the temple of Saturn are hard rough lava blocks full of leucitic crystals. This lava was brought from beyond Civita Castellana and was preferred to the native lava of the Apian Way because the crystals furnish a rough surface which is essential on a steep roadway. During the 1st century B.C. most of the streets were paved with large polygonal lava blocks neatly fitted and (at times) set in a concrete bedding and curbed with travertine. Outside of the city some of these pavements are still in use after 2,000 years of wear.

Bridges and Drains.—The first bridges of Rome were laid on wooden piles. In 179, stone piers were built for the Aemilian bridge (the *ponte rotto*). In the period between Gracchus and Sulla, architects had learned to make strong arches and then the Aemilian and the Mulvian bridges were constructed of splendid stone arches. The Fabrician bridge, contracted for apparently during Cicero's consulship, with two vast arches, is still in use. The first large sewer which drained the forum and cattle market seems to have been an open channel lined with capellaccio masonry. It was covered over early in the republic. The magnificent Cloaca Maxima which opens out near the Palatine bridge and was in use until the beginning of the 20th century was, to judge from its free use of Gabine stone, not constructed till the latter part of the 2nd century B.C. During the empire the whole city was as thoroughly drained with well-built sewers as any modern city.

Aqueducts.—Before 312 B.C. the city depended upon wells and springs for its water supply. In that year Appius Claudius, the censor, constructed an underground aqueduct 7m. in length to supply water to the poor of the crowded sections of the city. Forty years later the Anio Vetus was added. In 144 the Aqua Marcia was laid bringing an abundant supply of excellent water from high in the Sabine hills 44m. away. Where it crossed the lower plain outside of Rome the conduit was raised on splendid arches so as to bring the water to the top of the Capitoline hill. Some of these arches are still standing near Porta Furba; and the city of Rome is still using the springs that supplied the Aqua Marcia. Augustus, Claudius and later emperors enlarged the water supply, laid an extensive system of leaden pipes in the streets and built numerous fountains, till in Trajan's day the city was generously supplied with pure water.

THE FORUM

In the early days the valley between the Palatine hill and the Capitoline was marshy ground with an open pool, the Lacus Curtius, near the centre, another near the west end, the Lacus Servilius, which caught the spring waters of the Capitoline hill, and another, the Lacus Juturnae at the base of the Palatine. On the lower slope of the Capitoline hill, on a protruding ledge of rock, were altars to Saturn and to Vulcan, and between them a speaker's platform. On the corresponding lower slope of the Palatine was the shrine of Vesta with the house of the vestals near by and the

office of the pontifex maximus. Below the Esquiline was an extensive burial ground. When the marsh was drained and the three springs walled in the central part became an open market place—*Forum*—which was soon lined with two rows of shops (*tabernae*), while the north-west corner was laid off for open-air town-meetings (the *comitium*), and a speaker's platform was early constructed between the *comitium* and the forum. Without regard for chronology we shall briefly mention the more important buildings of the forum of which there are remains, beginning at the Tullianum on the north-west corner.

The *Tullianum* ("Mamertine prison") took the place, as death-chamber, of the older quarry caverns that here ran deep into the Capitoline hill. It was apparently built in the 3rd century B.C. Alban stone—the hardest material available—was used. The chamber was a truncated cone, about 12ft. high. It originally had a ceiling of oak beams, and could be entered only from a trap-door above. In the 2nd century an arc of the circle was cut away to make room for the road in front, and a straight wall of Grotto Oscura stone was built in its place. About 100 B.C. an upper vaulted chamber of Mt. Verde and Anio stone was constructed above the Tullianum, and later the lower chamber was given a horizontal stone vault. Finally, in the reign of Tiberius, a massive façade of travertine was built on the forum front. This is the chamber where noted prisoners like Jugurtha, the Catilinarian conspirators and Vercingetorix were kept before execution. It could never have been a well-house, as has been supposed, since the floor is actually above the republican level of the *comitium*. The present floor is about 6ft. above the original, if Sallust's measure of its depth is correct.

On the south of the Tullianum are the remains of the *Temple of Concordia*.¹ The original temple was erected to the deified abstraction of Concord in 366 to mark the temporary peace in the class conflict between the patricians and plebeians. The temple was rebuilt, partly with the earlier materials, and enlarged by the aristocratic consul Opimius in 120 B.C. to mark the end of the Gracchan class contests. The rededication to Concord was however considered an insult by the defeated Gracchans. Here Cicero delivered two of his Catilinarian speeches, using the temple for his addresses not only because he wished to remind the people of his programme of *concordia ordinum* but also because of the suggestive proximity of the place to the death-chamber. Tiberius rebuilt the temple in marble to commemorate the Concord of the Augustan régime. This new temple had a large portico and entrance on the forum side and the concrete base of this comes forward nearly to the Vulcanal. Portions of the elaborately carved cornice and of some of the capitals and bases are still to be seen in the corridor of the Tabularium. The temple was one of the most richly decorated at Rome and became a veritable museum of precious works of art. The corner of the podium nearest the prison originally belonged to the *senaculum*—a gathering place of senators—but was incorporated in the enlarged portico of this later temple.

Below the steps of the temple of Concord may be seen the remains of a very old *Altar of Vulcan* cut in the native capellaccio, and near by several cuttings in the rock which give evidence of an early cemetery here. Passing the *Arch of Septimius Severus*, a work of pleasing proportions though covered with confused reliefs of a decadent and boastful art, we reach the remains of the old *Rostra*, the scene of Rome's legislative struggles from the time of the *Twelve Tables* till Caesar. It is the birthplace of modern democracy. In the centre of the mass may be seen a few of the old steps that may belong to the platform of the decemviral times. The name *rostra* derived from the iron rams taken as trophies from the warships of Antium (338 B.C.) and fastened on the back of the platform (on the forum side). The outer steps of Mt. Verde stone on the side of the Comitium and the circular rear wall of concrete lined with reticulate blocks belong to a rebuilding of the Sullan period.

Between the *rostra* and the Arch lies a black stone pavement that marks a sacred area uncovered in the excavations of 1899.

¹Frank, *Roman Buildings of the Republic*, 39 ff.

²Robert and Marceau, in *Mémoires de l'Acad. in Rome*, v. 53.

³Jordan, *Topographie*, i.; Landani, *Ruins and Excavations*; Huelsen (Carter, tr.), *The Roman Forum*, with references to the reports of the excavators: Carlo Fea, Rosa, Fiorelli, Lanciani, Boni, et al.; ⁴Hédénat, *Le Forum Romain*; Lugin, *La Zona Arcaica di Roma*.

The layer of gravel which covered this area as well as the pre-Sullan rostra shows that the sacred area was abandoned and covered up when the Sullan rostra were built. The objects found beneath the black stone are a 6th-century inscription of very great importance, though so much damaged that no line is complete, a truncated cone which probably supported a statue, a double base which, according to Varro, supported two figures of lions, presumably such as Etruscans placed in front of important tombs, and a great many votive objects of different periods—now to be seen in the forum museum. Some of these objects were found in their original setting, others had been removed here and buried as being too sacred to destroy at the time when the rostra were rebuilt.

The inscription is cut on stone imported from Etruscan territory, and since the lettering is too archaic for the 4th century, when Rome captured the region from which it came, we must assume that it was brought here during the Etruscan period, i.e., before 509 B.C. The "black stone" was supposed by the Romans to mark the tomb of Romulus, of Faustus or of Hostilius. The riddle has not yet been solved.

The *Curia* or senate chamber, which stands in the comitium, is the debased structure of Diocletian's day, much altered and converted into a church. The first senate house (attributed to the king Hostilius) stood farther back, leaving room for a large comitium between the Curia and the rostra. The original bronze doors of Diocletian's Curia may now be seen at the end of the nave of the Lateran basilica.

Crossing the narrow street, the *Argiletum*, which led into the Forum from the north, we come to the extensive remains of the *Basilica Aemilia*. This was a covered hall in which court could be held when the weather was too inclement for sessions in the open forum. When building it in 179 B.C. Aemilius Lepidus and Fulvius Nobilior also rebuilt the row of public shops (*tabernae novae*) and included these under the same roof with a covered arcade in front. There was a hasty reconstruction by Aemilius Lepidus in 79. About the year 54 when Caesar planned his basilica along the opposite side of the forum at a higher level he lent large sums to Aemilius Paulus to reconstruct the Aemilian basilica at a corresponding level and in an appropriate style. This rebuilding, frequently interrupted, was not completed for 20 years. The foundations now visible are chiefly of this period, though the shop walls reveal materials of all three periods. Augustus later provided money for lavish repairs and decorations after the structure had been damaged by fire. Most of the splendid marble decorations now to be seen date from the Augustan period, deriving partly from the Doric façade, partly from the interior porticoes decorated with Ionic and Corinthian columns.

East of this basilica stands the temple which Antoninus Pius built in honor of his deified wife *Faustina*. After the emperor's death his name was added to the inscription. The columns are of the expensive and garish Carystian stone (*cipollino*) from Euboea, the walls are of peperino, a good fire-proof material, and were of course faced with marble slabs. The frieze has a charming design of griffins grouped in pairs around a candelabrum.

In front of this temple are the remains of the *Regia*, one of the oldest buildings of Rome. It may have been the office of the early kings, and certainly was of the pontifex maximus throughout the republic. The *capitellaccio* podium of the main quadrangle may well date from the fifth century. Professor Huelsen, who excavated the site, has drawings of a decorated terracotta slab from its frieze which belonged to the 5th-century structure. The rear wall, however, contains materials of a reconstruction, probably made in 148 B.C., when the place was damaged by fire. In this building were kept the important pontifical records and lists of magistrates which provided the skeleton of facts that historians eventually used in writing the story of the early republic. And because of this historical association, Domitius Calvinus, when rebuilding the house in 36 B.C. in marble, had a complete list of magistrates and of triumphs inscribed on its walls. Some remains of these inscriptions, called *Capitoline Fasti*, are now preserved in the Capitoline museum. The few architectural remains that lie near by reveal the fact that even as late as 36 B.C. marble cutting

was still very crude.¹ The pontifex himself had his home in the *domus publica*, the foundations of which, as it was when Caesar lived there, may still be seen a few yards to the south-east of the regia.

The extensive *House of the Vestals*,² as it appeared in the late empire, has many of its walls intact. They date from several rebuilding and additions made at various times during the empire. A few of the Vestal statues and honorary inscriptions remain, but not on their original locations, since all were found in a confused heap ready for the limekiln. Of the small republican structure there are few remains except the simple mosaic floor visible at a low level near the entrance. The foundation of the round shrine of Vesta is visible between this Atrium and the Regia, and near by are remains of the marble entablature cut in the decadent workmanship of Septimius' day.

Between the Regia and the open space of the forum stands the podium of the *Temple of Divus Iulius* which Augustus erected to the deified Caesar (dedicated 29 B.C.). This site was chosen because Caesar's body was burned upon a speaker's platform at this place (probably the *tribunal Atrianum*). The spot had first been marked by an altar, the foundations of which may still be seen.

Augustus in building the temple respected the altar, indenting the portico so that the steps of the temple rose at the sides of the altar. Hence the strange ground-plan. This temple was the first striking proof at Rome of the acceptance of the theory of "Divine rights" of Rome's princes. Foundation walls of heavy masonry built outside of the concrete mass now visible supported the walls of the temple. The temple itself was an Ionic hexastyle building of marble, the columns being about ten and a half metres high. The interior was very richly decorated with imported works of art, but the architectural decoration of the entablature, fragments of which are still to be seen on the south side, was rather crude, as was all such work at Rome during the period. A few feet south of this temple there still exist the foundations of the *Arch of Augustus* erected only ten years later. Fragments of the marble decoration of this arch may be seen lying at the nearby corner of the Regia. Though somewhat too graceful and delicate for the purpose of a triumphal arch those carvings are done with a care which shows a remarkable advance in such work during the ten years after the construction of the temple of Divus Iulius.

The famous temple of *Castor and Pollux*,³ which still has three Pentic columns erect with a part of the entablature, is the most prominent ruin of the Forum. The first temple on the site was built in the Tuscan style early in the republic (484 B.C.) to the divinities of the Greek cavalry who aided the Romans at the battle of Lake Regillus. Since these gods were adopted as the patron-deities of the Roman knights, the temple became the official meeting place of the knights and wealthy business men of Rome, and these took some interest in maintaining it. They used its coffers for safety deposits, and its basement offices for the protection of standard weights and measures and for an assay-laboratory for the testing of coins and metals. It thus came to be Rome's "Bureau of Standards." The *capitellaccio* blocks which may be seen in the podium remain from the first structure, while those found in a small room under the front stairway belonged to an early speaker's platform not directly connected with the first temple. Much of the inner core of concrete belongs to a reconstruction made by Caecilius Metellus in 117 B.C., while the rest of the concrete, as well as the heavy masonry, are a part of the reconstructed temple built by Tiberius in A.D. 6. The splendid Pentic columns seem, however, to belong to a reconstruction of Hadrian's day, though of this we are not yet certain. This last temple was Corinthian, octostyle and peripteral, with 11 columns on each side, the whole measuring about 30x50 metres. No temple at Rome reveals finer decorative workmanship.

Along the west side of this temple runs the vicus Tuscus which leads to a very large brick structure behind Castor. This has long been called the *Temple of Augustus*, though the brick-work belongs chiefly to the Flavian period and no traces of an earlier temple

¹Töbelmann-Flechter, *Römische Gebäute*; p. 8 (1923).

²Van Daman, *Atrium Vestae* (1909).

³*Memoirs Amer. Acad. in Rome*, v, p. 79.

have been found. The suggestion has also been made that it was intended as an audience chamber by Domitian.¹ There are serious objections to both hypotheses. East of this massive structure one enters the remains of the mediaeval church, *S. Maria Antica*, directly from the area of the Lacus Iuturnae. It contains frescoes—interesting to students of early Christian art, from the 7th, 8th and 9th centuries.² What the building was before Christian times is still a matter of dispute; older authorities assumed that it was a library, though it has not the usual form of a Roman library. A more recent suggestion is that it was the *Atrium Minervae* where the records of honourable dismissal of legionaries were kept. The impluvium, part of which is visible, belonged to the palace which Caligula had built here as an extension of his Palatine residence.

West of the vicus Tuscus, in the forum, are the confused remains of the *Basilica Iulia*. Caesar first built this on the site of the small basilica Sempornia, dedicating it in 46 B.C. To gain the necessary space he removed the shops which lined the Via Sacra of the Forum, and built in their place a row of shops all along the rear colonnade of his basilica. The whole was a vast structure designed to serve as a set for the four lower civil courts as well as for a market place. After a fire Augustus rebuilt it with lavish adornments of Oriental marbles, but later rebuildings after fires in the 3rd and 4th centuries left little of these structures to be seen. The modern excavators attempted to outline the ground plan by erecting bases of brick and marble fragments, but succeeded only in confusing the evidence of the structure found. An accurate reconstruction is no longer possible. The old praetor's tribunal, which stood in the forum in front of the Basilica Iulia, has now quite disappeared, but the remains of an inscription in honour of Naevius Sordidus, praetor, cut into the pavement blocks of the forum reveals the location. It was merely a low platform large enough to seat judges and jury, and was unprotected except for a canopy over the praetor's seat. The place was seldom used after the larger basilicas were built to house the courts, but it was here that the principles of Roman law were first formulated.

West of the Basilica Iulia, beyond the narrow street that was called the *vicus Iugarius*, stands a large part of the old temple of Saturn. The ugly granite columns with a portion of the entablature belong in part to a hasty reconstruction of the 4th century A.D.³ (a part of one column is even inverted). The inscription recording the final restoration avoids mention of the pagan god, and the building was then in secular use. Some fragments of the cornice are remains of the republican temple of 43 B.C.—from the period of crude stone-carving—while others are later work done on the same design. On the interior facing of the frieze may be seen some good decorative slabs that were actually flished from Trajan's forum for this hasty patchwork. The podium has not a trace of the splendid travertine masonry of Plancius' temple of 43 B.C. The only remains of the original temple of the early republic (497 B.C.) are the few capellaccio blocks visible in the podium (at the very base of the east side), and in the crude wall in front of the temple—remains apparently of the original altar. The low drain-vault that appears near the latter—also early work—carries a shelf on which was found a shallow trough, apparently the rannel constructed to carry away the blood of the victims sacrificed on the altar. Saturn was an early agrarian divinity, but since his temple stood not far from the senate house, the senators—who knew that temples alone might escape looting in times of war—began to store State moneys in this temple. It thus became the official Atrarium or State treasury at Rome.

West of the temple of Saturn stands the colonnade of the *Dei Consentes*, the 12 chief gods whose images were represented at public festivals, according to an imported Greek rite. The older parts of the structure belong to the 3rd century B.C., when the rite was introduced at Rome. The cult never received much attention. Between this and the temple of Concord is seen the podium of the *Verpation Temple*, on which three fine Corinthian columns

still stand. Titus began to build this temple to his deified father and after his death it was completed by Domitian. The well carved frieze and cornice are good examples of Flavian workmanship.

Finally at the very head of the market place are the remains of the *Rostra* built by Caesar and Augustus. What we see is a semi-circular approach in travertine steps from the area of Concord to the platform, and, on the forum side, the front foundation in tufa blocks (partly restored). The timber platform extending from the one to the other was at first supported by travertine posts standing upright, a few of which are still visible. When these proved too weak brick piers were added. The fragment of a fine wall of tile seen on the inside seems to be Augustan, and is one of the earliest instances of brick (broken-tile) masonry of Rome. It was removed in large part during the empire and the foundation which it lined was cut back into a semicircle to make room for a small chamber. The tufa wall on the forum side was originally faced with marble and to this wall were attached the beaks of ships (*rostra*) brought from the old platform of the comitium. The platform held numerous statues, and in the older concrete mass of Caesar's period we may discern separate concrete bases which probably supported such statues. The interesting marble bulustrades that now stand near the centre of the forum, decorated with excellent representations of political and sacrificial scenes, were probably made for this platform in Trajan's day.

East of the forum along the *Via Sacra* in its course over the *Velia* the excavations have left many problems unsolved. Between the street and the Palatine there are remains of many residences of the republican period. The foundations of old shops along the street—it was the jeweller's street—were probably of the Gracchan era. After Nero's fire the emperor covered the whole area with one vast commercial hall with an imposing portico of travertine arches along the street.⁴ Owing to faulty construction this building had to be strengthened later with brick-lined concrete piers which are now seen everywhere throughout the building. North of the *Via Sacra*, beyond Faustina's temple, stands the church of Cosmas and Damianus, which seems to have been the temple of the *Penates*.⁵ In front of this, later used as entrance to it, is an ugly round temple not yet identified with certainty.

Beyond the narrow street is the massive *Basilica of Constantine* (almost completed by Maxentius) which Michelangelo and Bramante studied for their plans of Saint Peter's, and which has influenced the architects of more than one structure in England and America. This basilica first had its entrance at the east end with its apse at the west. Constantine's architect built a portico at the centre of the south wall on the street, and made a tribunal against the north wall opposite this new entrance. Of the immense marble monolith columns (brought from the sea of Marmora) one is still standing in the piazza in front of *S. Maria Maggiore*. The plan is that which had been developed for the central halls of Roman baths rather than for the earlier basilicas. The four enormous piers, for instance, bear the weight on the interior, whereas in the Basilica Iulia, which is only a third as large, 74 pillars are used. The material of this immense basilica was sumptuous to a degree, but the decorative carving reveals the tasteless exaggerations and lack of practised artistry of Constantine's day.

At the top of the *Vella* stands the tasteful *arch of Titus*, as restored by Valadier more than a century ago. It commemorates the capture of Jerusalem, A.D. 70, and is decorated with two of the best reliefs that Roman art produced; the triumphal quadriga with the *Dea Roma* entering the city, and the floats that bore the chief objects of booty.

PALATINE HILL

The Palatine hill,⁶ according to tradition, was the site of the earliest settlement at Rome. Since the "hut of Romulus" stood

MONUMENTS AND BUILDINGS OF ANCIENT AND MODERN ROME

1. The Colosseum, begun by Vespasian and completed in A.D. 80
2. The monument of Victor Emmanuel II, designed by Giuseppe Sacconi, begun in 1885 and dedicated in 1911
3. Stairway of the Piazza di Spagna
4. The ancient walls of Rome
5. The Pantheon, built by Hadrian and consecrated as a Christian church in 609
6. The Apian Way
7. Bridge and Castle of S. Angelo, begun by Hadrian as a mausoleum for himself and his successors. It later became the medieval citadel of Rome

from the platform laid over these piers.

The north-east quarter of the Palatine is still occupied by S. Sebastian and S. Bonaventura. What buildings stood there in antiquity we do not know. The south-east quarter is occupied chiefly by the so-called "hippodrome" and the substructures of Septimius' additions to the palace. The "hippodrome" (the word was sometimes used for gardens of the long oval type) seems to have been a large garden which was surrounded by high retaining walls to keep the higher portions of ground from caving in. It certainly contained fountains, trees and walks, with a portico circling the whole within the wall. Perhaps the portico roof had hanging gardens. The masonry is of the Flavian period with additions and changes of a century later. The substructures of Septimius' palace spread in several directions. The central portion contained very luxurious baths. The lofty ruins that extend along the brow of the hill were apparently substructures that supported apartments from which the emperor could view the games of the circus below, while farther south-east stood the Septizonium with its lavishly decorated façade which was to remind the African friends of Septimius on approaching Rome that one of their countrymen occupied the imperial palace. A large part of the Septizonium stood till the 16th century, when it fell a prey to the greed of Sixtus V. (1588).

THE CAPITOLINE HILL

The Capitoline hill,¹ which in ancient times could be approached only from the forum, had in the regal period a fort (*arx*) on the northern height, an area sacred to Jupiter on the southern height and a wooded asylum on the depression that lay between these two. In the area sacred to Jupiter the last of the kings built a magnificent Etruscan temple with three cellas to the triad Jupiter, Juno and Minerva, and this, officially called the temple of Jupiter Optimus Maximus, was ready for dedication the first year of the republic, 509 B.C. The foundations of this temple have long been known, and when in 1919 the German embassy, which stood upon it, was torn down to make place for an enlargement of the Capitoline museum the old walls were excavated and measured. (*Notizie degli Scavi*, 1919.) These foundations, built of the native appellation, are now visible at two corners, and prove that though masonry was still fairly crude in technique, the original temple was built on the magnificent scale that it had in imperial restorations, about 60x50 metres. Since it was the largest temple in existence in Italy in that day we may conclude that the tradition was not far from correct which held that Rome was a large and wealthy city under the Etruscan princes. The first temple was probably, like the foundations, built of native tufa and covered with a white stucco. The porch was probably supported in four wooden columns set wide apart, and the wooden architraves were in Tuscan fashion covered with painted terra-cotta slabs. A few fragments which may possibly belong to the early temple have been found and placed in the museum near by. On the roof was placed a quadriga of Jupiter in terra-cotta made by the artists of Veii, probably by the same school of artists which created the splendid Apollo now to be seen in the Villa Giulia museum. This old temple, with its decorations renewed from time to time, stood until it was burned in 83 B.C. After various rebuildings it was reconstructed in marble with Pentelic columns by Domitian, and the surviving marble fragments of the entablatures that are in the museum give some idea of the magnificence of this Flavian temple. This marble structure was hexastyle with three rows of columns across the front and a row on each side.

Of the *Arx* and the temple of Juno Moneta later built thereon all traces have been hidden by the church of Ara Coeli and the recent monument to Victor Emmanuel II. The *Tabularium*, the gaunt walls of which command the view of the forum, has so frequently been altered in rebuilding the rooms of the modern council chamber of Rome that little but the rear remains intact. It was erected after the Sullan fire, which destroyed the Capitoline temple, to serve as a fireproof hall of records for the State. Gabine stone was employed for the exterior walls because it was known not to suffer

from fire. The ceilings of the rooms were domed with concrete and an arcade of round and flat arches was developed far beyond the usual architectural customs of the day to avoid the use of inflammable material. It is probably the first attempt at a hall of records that was to be absolutely impervious to the accidents of the elements, and the attempt was successful as the present condition of the store-chambers proves.

THE IMPERIAL FORA²

The Julian Forum.—Julius Caesar set aside a large part of the moneys which he derived from Gallic booty for the relief of the overcrowded forum. Thus he moved the comitium to the new *saepia* farther north, and built in the forum the large basilica mentioned above. His most extensive building, however, was a new forum enclosure with high walls and numerous shops lining the walls north of the old forum. In the *via delle Marmorelle* there are remains of the portico and walls ingeniously constructed of the three varieties of stone best adapted to the requirements. This wall was veneered with marble. Beneath, not now visible, are the remains of several of the shops built of tufa and vaulted with concrete. In the centre of the forum Caesar erected a marble temple to Venus Genetrix, the "ancestress" of the gens Julia. This temple he vowed at the battle of Pharsalus, doubtless intending that it should be a visible reminder of his own exalted claims. The forum itself was planned in 54 B.C. but not yet fully completed at Caesar's death in 44.

Forum Augusti.—Augustus completed the forum of his predecessor and built a larger one on adjacent ground chiefly for the purpose of enclosing a temple to *Mars Ultor* which he vowed at Philippi, 42 B.C. To protect the temple from fire he raised a massive wall of Gabine and Alban stone about the area. This wall, one of the most imposing now at Rome, rises roof-high. On the outside the great blocks were left rustic, while on the inside, where it was faced with marble, two rows of niches were cut to hold statues and honorary tablets to the noted heroes of Roman history. The statues have disappeared but many fragments of the tablets have been found. The area in front of the temple and on its north side was excavated in 1925-27 and revealed fragments enough of the entablature to ensure complete drawings of the whole structure. The marble decoration was of the best that the Augustan age could produce. The temple proves to be octostyle with a row of columns on each side while the rear of the cella stands solidly against the massive enclosure wall.

Forum Vespasiani.—The next imperial forum to be built was that of Vespasian, through the area of which the *Via Cavour* now runs. In its centre he constructed a magnificent temple to Peace, which is frequently mentioned for its library and its large collection of works of art—among them statues of Phidias and Lysippus. No part of this structure is now visible. Between the forum of Augustus and that of Vespasian lay the long and narrow area of the lower *Argiletum* about forty metres wide in which Domitian began to build a forum to contain a small temple of *Minerva*. Since Nerva completed and dedicated it, the structure bore his name, but the decorative work is all of the luxurious style of the Flavian period. Two of the columns of the handsome colonnade still remain with a part of the entablature. Its frieze is in bold relief representing the story of Arachne and other themes suitable for the adornment of a precinct sacred to the goddess of arts and crafts. No portion of the temple of *Minerva* is now visible but the whole area will probably soon be excavated.

Forum Traiani.—The *Forum of Trajan*, north-west of the Augustan group, was a large complex of open areas and buildings, including the spacious forum proper enclosed with a portico, the basilica Ulpia, the two library buildings, the column of Trajan, and, an addition of Hadrian, the massive temple of Trajan. Since the valley was too narrow for all these structures the opposing slopes of the Capitoline and Quirinal hills were cut back, and when necessary heavy retaining walls of concrete and brick erected, a part of which still remain. The forum proper had its stately entrance in the form of a triumphal arch near the forum.

¹Rodacanchi, *Le Capitole romain*, 1904; Platner, *Ancient Rome*, p. 191.

²Platner, *Ancient Rome*, p. 274 (1911), with earlier bibliography.

of Augustus. Its area is rectangular, 116 metres wide and 95 metres long. The large hemicycle against the Quirinal which is now being excavated served as a retaining wall of the Forum. The corresponding one on the opposite side has disappeared. The forum was of course open to the sky, but was surrounded by a very beautiful marble portico backed by a masonry wall. Many fragments of this portico may be seen lying about in the area. Next to the forum proper stood the basilica, which far surpassed the earlier ones in magnificence. A double row of 96 Corinthian columns supported the upper arcade that bore the roof. The nave was 25 metres wide; the apses at the end have been destroyed. North of this judgment hall were the two wings of the library, a rendezvous of literary men and students. In the area between these was built the column of Trajan¹ which is still standing. This column is roofed, high and is covered with reliefs arranged in a spiral band representing the events of Trajan's two campaigns in Dacia. This is apparently the first column which was decorated in this manner, and the reliefs are made with such fidelity to fact as to be our best document for the history of the wars. Since the porticoes of the library rose on both sides, the reliefs could then be seen from near at hand. Nothing now remains of the great temple of Trajan which Hadrian erected north of the column.

FORUM BOARIUM AND CAMPUS MARTIUS

Between the Capitoline and the well known church of S. Maria in Cosmedin is an area which in early Rome was used as a cattle market, though during the empire it was as thickly populated as it is now. In this area, near the river, are found two republican temples for which the original names have not yet been discovered. The rectangular temple, usually called the *Temple of Fortuna*, was freed from mediæval additions in 1923 and conservatively restored. It is exceedingly interesting as showing the type of building used at Rome in the late republic before Caesar and Augustus began to reconstruct Rome's temples in marble. It is an Ionic tetrastyle pseudo-peripteral temple of pleasing proportions, though small, measuring only 20x12 metres. The walls are of Anio tufa as are also the imbedded columns except those at the corners. These latter, as well as the free columns of the portico, all the capitals, the entablature of the porch and the facing of the podium are of travertine. The whole was covered with white stucco and the stucco of the frieze was neatly moulded into low reliefs of ox-skulls and garlands. The careful distribution of these materials points to the period of about 70-50 a.c. The round temple near by stands on a foundation of the 3rd or 4th century a.c., but the marble temple itself seems to belong to the Augustan period. It would be a graceful temple if the entablature and roof could be restored as well as several of the capitals which have apparently been replaced by alien material. It is of course not a temple of Vesta, but its true name is not known. Huelsen has suggested "Fortunus."

The double-arched *Janus quadrifrons* which stands over the Cloaca Maxima, is of late date and of ugly proportions. The extensive remains that are found in and under S. Maria in Cosmedin apparently belong to the public granary as it was in Cicero's day. Under the church of S. Nicola in Carcere near the Piazza Montanara are seen the foundations of three temples that stood beside the vegetable market outside the ancient Porta Carmentalis. These seem to be—from north to south—the temples of Janus, Juno Sospita, and Spes, originally built respectively in 260, 194 and 258 a.c. Most of the materials now visible belong to the rebuildings of c. 90 a.c. (Janus), 90 a.c. (Juno Sospita) and 31 a.c. (Spes). For the architectural history of the republic they are very important. Farther north on the site of S. Maria in Campitelli stood the famous old temple of Apollo where the sibylline books were kept and near which, on the slope of the Capitoline, Rome's early plays were given at the games of Apollo. The temple was first built in the early republic (431 a.c.) but the extensive remains now to be seen under the church seem to belong

to the reconstruction of 179 a.c.² Because of the association of this district with early dramatic performances Augustus constructed a very large theatre near by (first used, when still incomplete, in 17 a.c.) which he named in honour of his nephew Marcellus. A large part of the semicircular façade is still standing and when it has been cleared of its ugly shops and superstructure—excavations are in progress—it will be one of the most imposing ruins of ancient Rome. The exterior consisted of three series of open arcades, the lower one being decorated with engaged columns of the Doric order, the middle with Ionic ones, the third with Corinthian pilasters. The theatre seated about 10,000 spectators and had a stage of the enormous proportion of 80x20 metres.

North of this theatre may be seen the portal of the extensive Porticus of Octavia (originally the Porticus of Metellus) which enclosed large temples of Juno and Jupiter. The whole was originally built in the 2nd century a.c., but all the remains now visible belong to the debased art of the Septimian period. Within may be seen, rising above shabby walls, a column and capital of one of the great temples. North-east of this lay the extensive *Circus Flaminius* built before the second Punic war as a place to hold the plebeian games. Fragments of the supporting walls may be seen in the basements of several houses on the Via di Botteghe Oscure, but these all belong to a rebuilding of about 50-30 a.c. A few hundred feet to the north-west of this circus, Pompey built his massive theatre in 55 a.c., the first permanent theatre of Rome. This was about the same size as the Marcellus theatre and its stage was even longer. Considerable remains of it are to be found under the shops east of the Campo dei Fiori.

Farther north, in the old Campus Martius is the Pantheon,³ a structure which Hadrian built to replace the earlier temple of Agrippa and Domitian. This round temple was one of the boldest of old Roman structures, having a brick and concrete dome with a diameter of 43½ metres without support except on the walls of the temple. The dome itself was built of narrowing circles of brick on which were laid several layers of concrete which hardened into one firm mass so that there is no lateral thrust on the walls. The walls of the rotunda are also of brick-faced concrete with solid brick arches running through the mass to aid in carrying the weight over the niches while the mass was solidifying. The portico is a rectangular structure, most of whose columns belong to Hadrian's time. Some of the repairs of its entablature seem to be of a later period. The large inscription on its front generously credits the building to Agrippa while the smaller one mentions the repairs of Septimius. Nothing is said of the actual builder, but the brick stamps and the style of work prove that Hadrian should have the chief credit. The exterior was of course faced with marble slabs, and the sumptuous decoration of the interior—originally even more elaborate—will give some idea of how lavish the whole building must have been. The temple was dedicated by Agrippa to the divinities of the Julian house, and the name was intended to convey the idea of "all-holy." Of other notable buildings in this region we may mention the temple of Hadrian, the walls of which have been incorporated in the Borsa, or stock exchange; the *Mausoleum of Augustus* which has still recently served as a concert hall, called the Augusteo, and the tomb of Hadrian, on the right bank of the Tiber, rebuilt during the middle ages into a fort called the Castel San' Angelo.⁴

The *Colosseum*,⁵ or more correctly, the *Amphitheatrum Flavianum*, was begun by Vespasian on the low ground that Nero had used for a lake in the centre of his imperial villa. It was used for hunts, sham battles, gladiatorial shows and races, and the arena could be flooded for sham naval battles. The façade consists of three series of 80 arches decorated in the three orders as were the theatres of Pompey and Marcellus, and rises 48½ metres. Stone masonry in travertine lined with tufa supports the heavier outer portion, while the vaulting of the arcades and the inner bowl consist of concrete. The seats were of marble and could hold about 50,000 spectators. The building which is elliptical measures

⁵Ashby, *The Architecture of Ancient Rome*, p. 93.

188 metres in length and 156 metres in width, while the arena measures 86.54 metres. It was apparently the largest amphitheatre in the Roman world.

Near by stands the well proportioned *Arch of Constantine* which however is largely constructed of materials taken from previous arches. The only sculpture upon it that belongs to Constantine's day is the very narrow frieze rudely carved in a band about its centre. The other reliefs were taken from structures of the second century and in the use of these the imperial portraits were re-chiselled to represent Constantine. North-east of the Colosseum one may enter several rooms of the *golden house* of Nero,¹ or rather the private apartments of that emperor. The rooms have been to some extent preserved because the walls were later used as substructions for a part of Trajan's baths built at a higher level. Many of the rooms of the palace have recently been excavated and reveal much damaged frescoes and stucco reliefs which represent the best work of its kind at Rome for the period of Nero. It was here, as graffiti on the walls indicate, that several of the Renaissance painters borrowed themes and designs for the arabesque and "grotesque" decoration so popular when the loggia of the Vatican was decorated.

Several of the massive *Thermae* (Baths) of ancient Rome are still among the most conspicuous ruins of the city. The first large structure of this type was the one built by Agrippa in 20 A.C. south of the Pantheon. Little now remains of this. More may be seen of the ruins of those constructed by Titus and Trajan (on the grounds of Nero's *Domus Aurea*), by Caracalla on the edge of the Aventine and by Diocletian (part of which is now used for the national museum). Since these buildings contained, besides the baths, playgrounds, gymnasia, clubrooms and auditoria for immense crowds, the architects who constructed them had to employ all the arts and sciences at their disposal. The central building of Caracalla's baths covers an area of 270,000 sq. ft.; and the central hall has a clear space of 183 x 79 ft. It is roofed with a solid concrete intersecting barrel vault that rests chiefly on four massive piers and rises 108 ft. from the pavement. It was while solving the problems of such construction that the Roman architects made those contributions to their art which have been most frequently studied by recent architects. The baths of Diocletian have suffered more from time, but the church of S. Maria degli Angeli has preserved two of its great halls. Here may be seen in their most advanced use at Rome good examples of flying and rectangular buttresses, a careful system of thrusts and counter thrusts and of ribbed quadripartite vaulting. A large number of the smaller rooms are used by the Museo delle Terme.

Finally the *Subterranean Basilica*² discovered near Porta Maggiore in 1917 has proved to be not only one of the best preserved of ancient buildings but one of the most important for the interpretation of Roman life. Though it seems to have been built before the middle of the 1st century A.D. it has the regular basilican form with nave, apse and two aisles. It was built wholly underground apparently for the purposes of a secret religious sect. The ceilings of the nave, the apse and the aisles are richly adorned with excellent stucco reliefs, the interpretation of which has proved as difficult as would be the explanation of the biblical illustrations of a mediaeval cathedral if we had no copies of the Bible. The most generally accepted view is the one proposed by Cumont, that this basilica was the temple of a Neo-Pythagorean congregation which practised mystic rites of initiation that were not approved of by the imperial authorities, and that the reliefs in question pertain to myths and rites which had been given a symbolic interpretation in the Neo-Pythagorean ritual. But quite apart from their meaning, they now give us the best conception possible of the beauty of Roman interior decoration for the 1st century of the empire. (See Rivoira, *Roman Architecture*, p. 204.)

(T. F.)

THE MODERN CITY

In the middle ages the population of Rome had dwindled to twenty or thirty thousand inhabitants, who lived huddled together

¹Wegge, *Das Goldene Haus, Jahrb. des Arch. Inst.* p. 127 (1913).
²Carpino, *La Basilica Pythagoricaenne* (1927); for illustrations see *Memoirs Amer. Acad.* iv. (1924).

about the strongholds of the barons, and the modern city grew slowly upon the exiguous foundation of a mediaeval town. The first plan for modernizing and improving Rome was that of Pope Julius II, who aimed at the enlargement of the lower city on both sides of the Tiber. Following him, Sixtus V. did his best to develop the upper part of the city by laying out the Via Sistina, from the Trinità dei Monti to S. Maria Maggiore and Porta S.

WEATHER GRAPH OF ROME. THE THERMOMETER INDICATES THE ANNUAL MEAN TEMPERATURE. THE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE AND THE COLUMNS, THE MONTHLY PRECIPITATION

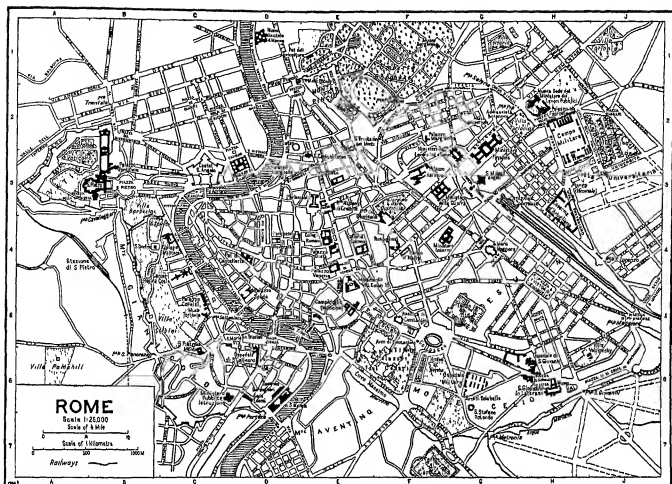

Giovanni. A plan of improvements was made, under the direction of Mgr. de Merode, during the reign of Pius IX.; and, although only very partially executed, has served as a basis for later efforts.

Great changes in the municipal and social conditions followed the occupation of the city by the Italians (Sept. 20, 1870), and the rapid increase of population due to immigration from other parts of Italy. In a rush of land-speculation, trees and fine villas were unfortunately destroyed. As soon as political circumstances admitted, the municipality set to work.

Two principal problems presented themselves. The more important was the confinement of the Tiber in such a manner as to render impossible the serious floods which had from time to time inundated the city, often causing great damage to property and rendering the lower streets more or less impassable. There were floods which almost reached the level of the first storey near San Carlo in the Corso, and it was common to see the great Piazza Navona and the neighbourhood of the Pantheon full of water for days together during the winter. The interruption of traffic can be imagined, and the damage to property was serious. The other urgent matter was one of which the government of Pius IX. had been partially aware, namely, the necessity for opening better thoroughfares between different parts of the city.

It is necessary to distinguish between the work carried out by the municipality, and that which was done in the way of private speculation. The first was on the whole good, and has proved enduring; the second was in many cases bad, and resulted in great loss. As soon as the opening of such streets as the Via Nazionale and the Via Cavour, the widening and straightening of the Via dell' Angelo Custode, now the Via del Tritone Nuovo, and similar improvements, such as the construction of new bridges over the Tiber, had demonstrated that the value of property could be doubled and quadrupled in a short time, and as soon as the increase of population had caused a general rise in rents, owners of property awoke to the situation of affairs, and became as anxious as they had at first been disinclined to improve their estates by wholesale building.

The most important work executed by the government with the assistance of the municipality was the construction of the embankments along the Tiber. Though damaged by the great flood of December 1900, their truly Roman solidity saved the city from the disastrous consequences of a wide inundation. It is impossible not to admire them, and not to feel respect for a people able to carry out such a plan in such a manner and in so short a time, in

the face of such great difficulties. But so far as the life of the city was concerned, the cutting of new streets and the widening of old ones produced a more apparent immediate result. The opening of such a thoroughfare as the Via Nazionale now named in part Via Cesare Battisti, and in part Via Quattro Novembre could not but prove to be of the greatest value. It begins at the Piazza delle Terme, in which the principal railway station is situated, and connects the upper part of the city by a broad straight road, and then, by easy gradients, with the Forum of Trajan, the Piazza dei Santi Apostoli and the Piazza di Venezia, whence, as the Corso Vittorio Emanuele, it runs through the heart of the old city, being designed to reach St. Peter's by a new bridge of the same name opened in 1911 near the bridge of S. Angelo. It is true that, in order to accomplish this, the Villa Aldobrandini had to be partially destroyed but this is almost the only point which lovers of beauty can regret, and in compensation it opened to full view the famous palace of the Massimo family, the imposing church of S. Andrea della Valle, and the noble pile of the Cancelleria, one of the best pieces of architecture in Rome. Another great artery is the Via Cavour, which was intended to connect the railway station with the south-western part of Rome, descending to the Forum, and thence turning northwards to reach the Piazza di Venezia on the east side of the monument to Victor Emanuel II. It was proposed again (1928) to extend the Via Cavour to the Piazza. Rome is now divided clearly into two parts, the old and the new, of which the old is incomparably the more artistic and the more beautiful, as it will always remain the more interesting. A tunnel under the Quirinal Hill connects the north end of the old city, the Corso, Babuino, etc., and the upper part of modern Rome, including the former Via Nazionale and the Esquilina. A causeway and bridge unites the Pincio with the Villa Borghese, or, as it is now called, the Villa Umberto Primo. In 1911 zoological gardens were arranged in the grounds of the Villa and a fine collection of modern Italian art was opened in the Palazzo delle

Belle Arti, to the west of the Villa.

The Policlinico, on the Macas, is one of the finest hospitals in Europe. It is on part of the large site, east and south of the Castro Pretorio, requisitioned by the Government for building a new University, and bringing together various institutions scattered about the city. Of this scheme the hospital forms part. The military hospital is on the Coelian. In 1910 in honour of the jubilee of the unity of Italy, the formation of an archaeological park, extending from the Via Appia to the foot of the Aventine and almost to the Aurelian Wall, was approved by the Parliament. It contains the Baths of Caracalla. Among the important modern buildings are the Cassa del Risparmio, in the Corso; the Palazzo Negroni, near the Piazza Nicotia, the Chamber of Deputies, with its principal front on the new Piazza del Parlamento and the Palace of Justice, near the castle of St. Angelo. It was proposed in 1922 to make the barracks and storerooms of the Castle of St. Angelo into a topographical museum. In the same year a museum of antiquities for the Forum was arranged in a building adjoining the church of Santa Francesca Romana; and the Museo Petriano, containing objects connected with the foundation and development of St. Peter's was opened in 1925.

Municipal Administration.—After 1870, those who remained loyal to Pius IX. took no part whatever in public affairs, and the municipal administration was entirely in the hands of the liberals. The expression "né eletti né elettori," meaning that Catholics are to be neither voters nor candidates, which came to be regarded as a sort of rule of the party, was invented at that time by an epigrammatic journalist, and it seems at first to have been applied also to municipal matters, whereas it was later understood to refer only to parliamentary elections. Leo XIII encouraged the formation of a Catholic party in the municipal administration, and the municipal government then drifted largely into the hands of Catholics. In the year preceding the fascist régime the three democratic parties, known as the liberal, republican and

socialist, united to form a popular coalition, and succeeded in completely excluding the conservative, aristocratic and Catholic elements. Prior to 1926 there was a municipal or Communal council chosen by the electors and a Syndic (mayor) drawn by the municipal council from its members. In all Italian communes except Rome and Naples fascism substituted for these a *Podestà*, but Rome itself has a governor.

Population.—The population in 1870 was 226,032, by 1901 it had reached 462,743 (communal population). It therefore more than doubled in thirty years. The increase, however, did not take place at a regular rate, owing to the changes in the rates of immigration and emigration. In 1936 the population had reached 1,094,710 (town), 1,150,589 (commune), an almost as rapid increase as during the period 1870–1901. In 1938, it was estimated 1,279,748. There are in the city population many military and ecclesiastical officials.

Climate and Hygiene.—Rome is mild and sunny, but the variation in temperature between day and night is very great. December to February appear to be the coldest months, the thermometer then averaging 47°; the greatest heat, which averages 75°, is felt in July and August. The surrounding Campagna is still not all habitable during the summer, though the dangerous malaria has been much checked by the planting of numerous eucalyptus trees. A remarkable instance of the effect produced upon the marshy soil by these plantations may be studied at the Trappist monastery of the Tre Fontane, situated on the Via Ardeatina, about 4 mi. from Rome. Whereas in former times it was almost always fatal to spend the whole summer there, the monks have so far dried the soil by means of the eucalyptus that they reside in the monastery throughout the year. The municipality has made strenuous efforts, attended with marked success, to reduce the mortality due to malaria. The hygienic conditions of Rome itself have greatly improved, largely through the ceaseless efforts of Guido Baccelli, a distinguished man of science, who repeatedly held office in the Italian Ministry. Ninety per 1,000 deaths occurred in 1871 from typhoid (the so-called "Roman fever"), but the average has now fallen to a low constant. Since the introduction of compulsory vaccination deaths from smallpox may be said not to occur at all. The death rate in 1928 averaged about 20 per 1,000.

Charities and Education.—A great number of small charitable institutions for children and old people have been founded, which are organized on the most modern principles, and in many of these charitable persons of the upper classes give their individual assistance to the poor. There are also private hospitals for diseases of the eye, in which poor patients are lodged and treated without payment. There are two hospitals entirely maintained by private resources, where infants are treated whose mothers fear to send them to a public hospital, or in cases refused by the latter as not being serious enough for admission. Of course, the numbers of the poor greatly increased with the growth of population, especially after the failure of building speculations between 1888 and 1890, though great efforts were made by the municipality to send all persons then thrown out of employment back to their homes. One of the difficulties under which Rome labours is that while it attracts the population of the country, as other capitals do, it possesses no great mechanical industries in which the newcomers can be employed. Efforts to create small industries in the populous quarters of the poor met with little success. Before 1870 a society was formed, which has since greatly developed as an intelligent private enterprise, to provide the poor with sanitary tenements; but its success is much hampered by the absence of employment, which again is partly due to the heavy taxation of small industries. A number of trade schools are also maintained by private funds, such as the Istituto degli Artigianelli, managed by the Fratelli della Dottrina Cristiana, and the Riconvero dei Fanciulli Abbandonati (home for friendless children), which is under lay management and has flourishing work shops. The character of official charities has certainly improved in principle, so far as their educational and moral scope are concerned, for whereas in former times the limited number of the poor made individual and almost paternal relief possible, that form of charity had a pauperizing influence. If anything, the present tendency is to go too far in the opposite direction, and to require too many

formalities before any relief is granted; and while the union of the principal charities under a central management on advanced theories improved the methods of administration, it destroyed numerous small sources of immediate relief on which the poor had a traditional right to count, and was in that way productive of hardship. At the same time, however, mutual benefit societies (*società di mutuo soccorso*) have been organized in great numbers by the different crafts and professions, and are chiefly distinguishable by the political parties to which they belong. It is characteristic of the modern Roman people that the most widely different elements subsist without showing any signs of amalgamating, yet without attacking each other. Some of these societies have an exclusively clerical character, others are merely conservative, some consist of monarchists, and some of avowed republicans.

Popular education is principally in the hands of the municipality, but besides the public schools there are numerous religious institutions attended by the children of the lower classes; they follow the curriculum prescribed by the government, and are under the constant supervision of municipal inspectors, both as regards their teaching and their hygiene. The pope also expends large sums in the maintenance of the people's schools, managed entirely by laymen, and also under government inspection. For education of the higher grade, besides the regular lycées and gymnasiums, there are many private schools similarly designated from which pupils can present themselves for the regular government examinations. The University of Rome was established in 1265 and in the session 1924–25 there were 4,500 students. There is also a Higher Institute of Economic and Commercial Education founded in 1906 with some 2,000 students. Rome has also an Engineering college, a Women's Training college and a School of Architecture. The State regulates public education and maintains either entirely or in conjunction with the municipality public schools of every grade. (X.)

ANCIENT HISTORY

I. THE BEGINNINGS OF ROME

The limestone ridges that border Latium contain numerous remains of stone age settlements, and one has even been found on Monte Mario within 3 m. of the Vatican in the old volcanic stratum that borders the right bank of the Tiber. On the left bank, however, within the area that was in prehistoric times subject to rains of volcanic ash from the Alban craters there are very few traces of human habitation before the iron age.¹ Perhaps the activity of the volcanoes kept migrants from settling there during the bronze age. The oldest settlements so far discovered within this peculiar region seem to be those of the Alban hills, between Grotta Ferrata and Albano. Here several groups of cremating people belonging apparently to the so-called Villanova² (q.v.) branch of the Indo-Europeans came down from Tuscany and settled, about the end of the 2nd millennium B.C. In the early part of the 1st millennium they spread here and there over the Latin plain as far as at least as Antium on the sea and the Palatine hill on the Tiber. In the primitive cemetery of the Forum 40 graves have so far been excavated. The deepest and earliest were cremation burials containing the same kind of pottery and personal ornaments as those of the Alban hills. Later, possibly in the 8th century, the rite of inhumation began to take the place of cremation here as on the Alban hills, at Antium, at Veii and at Falerii north of the Tiber. It is generally assumed that Sabine people from the central mountains were at this time pressing into Latium in large enough groups to become in several towns the dominating element. Whether further excavations will prove that this rite replaced cremation in all the primitive burial places at Rome is very doubtful. The fact that cremation again became the orthodox rite during the Roman republic would incline us to assume that cremation survived in some cemeteries that have not yet been discovered.

Early Institutions.—By the 7th century we may assume that
1 Von Duhn, *Itälische Gräberkunde*, 392 (1924); Antonioli, in *Bull. Palet. Ital.*, 161 (1924).
2 Randall-MacIver, *Villanovans and Early Etruscans* (1925); *Iron Age in Italy* (1927).

the Palatine, the Capitoline, the Esquiline and the Quirinal hills had compact settlements of "Villanovan" and Sabine farmers and shepherds. These two groups were closely related in culture, language and religion. Philology proves that the bearers of the Latin language (probably the cremating group) and those who spoke the Sabellic dialects had not been separated very many centuries, and that they had been one people before entering Italy over the Alps. Several of their deities—Jupiter, Mars, Juno, Minerva and others—were also a common inheritance, and were worshipped by both peoples with rites that knew nothing of anthropomorphism. That it was a religion peculiarly adapted to an agricultural people we learn from the oldest calendar of festivals, which was drawn up before the Etruscans came to Rome. (W. Warde-Fowler, *The Religious Experience of the Roman People* [1911], 92.) Their political and social organizations were also of the same kind. The property-owning males constituted the "town-meeting" and the army. They elected the annual leaders (usually two "praetors" or "consuls") who summoned and conducted the meetings, held the elections and directed the army. The consuls must consult a smaller group of elders (senators), heads of important families, in all matters of public interest. Without the approval of the elders no proposal was put before the commons. For purposes of transacting business the commons of a town were usually divided into ten wards called *curiae*. That Rome had 30 instead of ten seems therefore to indicate that Rome was a union of three settlements already organized into regular polities before the city government was formed. In taking possession of the country, these people had settled in village groups, usually upon some hill which could be defended, and which gave access to a good spring of water or a stream. Most of the land near each village was apparently divided into private holdings, though it also seems probable that some land was left undivided for community grazing. Sacred land, used for the support of the cult, was also set apart at a very early period. These villages were independent and autonomous within the tribe. A tribal organization, however, existed, which supported a tribal cult on the Alban mount. This tribal organization was kept alive by an annual religious festival, and it had a presiding officer whose duty it was in time of danger to summon the forces of the different communities to common action. Since both the Villanovan and the Sabine communities shared in these democratic customs they coalesced readily in such a large tribal organization.

Finally both peoples long retained the institutions of a very strong patriarchal organization. Women, children and slaves were subject to the *potestas* of the family patriarch. He gave the members of his household in marriage, assigned the properties—there are but shadowy traces of clan-ownership, and testamentary rights are highly developed—and he, with his family council, meted out punishment for crimes committed within the family, and in the earlier day at least, directed the vendetta of the family against those who had committed a wrong against him or his. While the villages were still small, there were few opportunities for community action, whether judicial or legislative, so long as the patriarchal customs were respected.

City States.—At an early day these numerous communities belonging to a wide-spread tribe began to aggregate to a few favoured centres where cities grew up. Such cities soon overshadowed the villages and endangered the existence of the Latin tribal organizations. It is likely that raids from across the Tiber and from the Sabine and Volscian hills emptied the more exposed villages that could not well be fortified, drove the populace to more defensible villages, and in the case of places like Praeneste, strongly situated near the natural road between Etruria and Campania, trade of a lucrative kind also attracted settlers. It was in this way that some six city-states gradually grew up in Latium to take the place in each case of several villages. The growth of such cities in these circumstances naturally required stronger and more efficient governments, a better army organization, the building of walls or at least defensible earthen mounds with protecting pickets.

Kings.—At Rome the coalescing of three villages with their 30 *curiae* may date from the 8th century B.C. And here since the

threats of Etruscan raiders from Veii and Caere added much to the difficulty of governing communities that are not wholly homogeneous, elective princes holding office for life seem for a while to have displaced the customary annual magistrates. Tradition held that of these early princes Romulus (q.v.), Hostilius and Ancus Marcius were Latins, but that Titus Tatius (the prince of a Sabine group) and Numa Pompilius (q.v.) were Sabine in origin, while Tarquinius Priscus was said to be the son of a Corinthian adventurer who had first settled in Tarquinium and married an Etruscan woman, and Servius Tullius was an Etruscan chief by the name of Mastarna.

There is nothing unreasonable in this tradition, and since the art of writing was already known, the names may well have survived from early times on inscriptions of public buildings, treaties and tombs. The tradition regarding Servius Tullius was at least derived from Etruscan documents of an early date. (See the speech of the Emperor Claudius, Dessau, *Ins. Lat. Sel.*, 212.) History, however, need not take seriously the numerous legends preserved by Livy regarding the wars and deeds of these kings. Villages near Rome which naturally dwindled to insignificance under the attractive power of a neighbouring city left traces of themselves in abandoned walls; and picturesque legends grew up to account for their annihilation, but most of them had decayed several centuries before history was written.

Etruscan Kings.—The Etruscan (see ETRURIA) house of the Tarquins seems to be more tangible. Tradition places their rule in the latter half of the 6th century B.C., at a time in fact when we know that Etruscan princes were making conquests southward as far as Capua, when Etruscan art and Greek objects of art carried by Etruscans came into Rome as they did into Praeneste, Velitrae, Ardea, Satricum¹ and other Latin towns, when Rome received a stone ring-wall enclosing a remarkably large area and ceased to use the Forum cemetery for burial—since that now was included within the ring—and when Rome's rulers began to reach out for the control of the larger part of Latium.

The Etruscan adventurers, employing methods like those of the Normans who ruled the Sicilian cities in the 12th century, had come by sea to govern and exploit the unorganized communities of the Villanovans some two centuries before. Different families had secured control of most of the districts of Tuscany, had fortified their various cities, trained their subjects into effective armies as well as into obedient tenants and serfs, had developed farming by improved methods of planting, draining and irrigation, had exploited the copper and iron mines of Etruria and organized a flourishing industry in metal work with which they attracted Phoenician and Greek traders and had even entered actively into maritime commerce.²

Whether the Tarquins actually seized Rome by force or migrated to Rome and secured control by political devices we do not know. Under them Rome and Latium underwent very remarkable changes. An extensive wall³ of almost 6m. was built to enclose an area that would readily house 200,000 inhabitants living in low small houses. There could hardly have been so many inhabitants when the enclosure was made; and indeed the walls, in order to make use of natural escarpments and to include outlying shrines, probably took in many undeveloped tracts. We cannot be sure that the regal wall extended as far out as the so-called Servian wall, despite the existence of very old remains in the gardens of the "Villa Spithoever." Tombs of the 4th century within the area seem to prove at least that the sacred *pomerium* did not extend so far, even if the fortifications did. Nevertheless the regal city was remarkably large when compared with other Italian cities, and its size points to a builder who was intent upon extensive projects of development. The Tarquins certainly opened the city to the currents of Mediterranean commerce now being attracted westward by Etruscan prosperity. Tradition plausibly holds that a port was used at the mouth of the Tiber as early as the 6th century; Greek and Etruscan articles came

¹Della Seta, *Museo di Villa Giulia*, I, 235 (1918).

²D. Randall-MacIver, *The Etruscans* (1927).

³*Papers of the American Academy in Rome*, III, 112 (1924).

to the city, Greek and Etruscan artisans were at work on the public buildings, and it is not unlikely that some of the industries that prospered in Etruria were enticed to Rome.

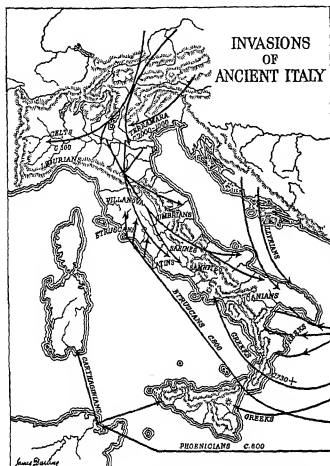

A strong army was also organized. Tradition attributes the regal army of nearly 20,000 men to Servius, who came from Etruria and doubtless employed the same methods as other Etruscan princes. Of these, 9,800 belonged to the "first class" of property holders, the rest to the other four classes; that is to say, all of the "first class" men were liable to army service, but

land had been very much in demand and the population much more dense than in historical times.

The Etruscan princes were also vigorous conquerors, bent on extending their power throughout Latium. Tradition, reported by Livy and Dionysius, dwells long on their wars of conquest with Veii, Latin towns like Gabii, Aricia, Ardea and the Volscians as far as Tarracina. That this tradition happens to be fairly correct we may conclude from the facts that the region below Veitras was particularly submitted to agricultural development (Frank, *Economic History of Rome*, 8 and 35, 2d ed. 1927), that the colony of Cora existed at the founding of the first Latin league, and that the terms of the first treaty between Carthage and Rome, signed in 509, prove that the principality developed by Tarquin extended as far as Tarracina. This famous treaty recorded by Polybius (III. 22-3) is our oldest genuine document of Roman history. It was signed with the new republic of Rome immediately after the Etruscans had been banished and doubtless to a large extent reiterated the provisions of the previous treaty which the Tarquins had signed when in control of Rome. In the first sections it assumes that the free Romans would continue commerce on the seas to the extent that the Punic trade monopoly at Punic ports. That proved to be a needless precaution, for the Romans abandoned the seas soon after they fell out of touch with Etruscan enterprise. A paragraph of the second part of the treaty reveals how far the ambitions of Etruscan Rome had advanced. It reads, "The Carthaginians shall do no injury to the people of Ardea, Antium, Laurentum, Circei, Tarracina, nor any other people of Latium which are subject to Rome. From those townships of Latium which are not subject to Rome they shall hold their hands; and if they shall take one they shall deliver it unharmed to the Romans." If, as seems to be the case, these clauses remain standing from Tarquin's last treaty with Carthage, they indicate that Tarquin had conquered at least the towns named, and that such towns as Pometia and Satricum, which are not mentioned, are considered within the sphere of Rome's natural interests, so that even if Carthage in some dispute should attack them she must deliver them to Rome. Needless to say the Roman republic which signed this treaty could not long entertain such ambitions, inherited for the time from Tarquin. Rome discovered within a few years that she had to release the Latins from subjection in order to win their support in her struggle with the returning Etruscans.

The terms of this treaty reveal how powerful Rome had become under the Tarquins and explain to us the resources that could pay for the building of a wall of 6m, and the power that could muster and employ an army of 20,000 men. They also help us to picture the resources that were expended in a very aggressive building programme. The temple to Jupiter which Tarquin nearly completed on the Capitoline hill stood on a lofty stylobate more than 20ft. high and measured about 200ft. x 185ft. None of the flourishing Etruscan cities with all their commercial prosperity had any temple comparable to this. Tarquin also moved the Diana cult from Aricia to Rome so as to make Rome the religious centre of the Latin communities of the Alban hills, and to Diana he built a famous temple on the Aventine. To the Etruscan period are also attributed several Fortuna temples—since soothsaying was particularly in favour with the Etruscans. Then in the first years of the republic there were built several temples begun by the Tarquins or vowed in the vigorous spirit of enterprise that the Tarquins had instilled; the large temple of Saturn below the Capitoline, the temple of Mercury—the god of commerce—behind the Palatine, the temple of Ceres nearby, and the splendid temple of Castor in the Forum. Not till two centuries later did the republic spend so much energy and money in public buildings, for with the expulsion of the Etruscans Rome became again a rural market place.

The effects of the Etruscan régime were widespread, though it apparently did not last more than about a century—if we are right in dating the last of the Forum burials about 600 B.C. In the Etruscan Government the senate had been retained, though virtually stripped of power, and the assembly was probably never

FROM FRANK, "HISTORY OF ROME" (CAPS)
MAP SHOWING INVASIONS OF ANCIENT ITALY, WITH APPROXIMATE DATES

only a diminishing proportion of the lower classes. In any modern industrial city where 10,000 males of military age constitute the highest 20% of taxpayers one would have to assume a population of at least 500,000 souls, or 100,000 male citizens; and that would be a very large population for a city with a rural territory of only about 500sq.m. (320,000ac.). It must, however, be remembered that in early Latium the proportion of property owners was large, that the Latin communities had consisted chiefly of farmers practising hoe-culture to whom 5-10ac. would not only suffice for a family but would require all its energies for cultivation. In the rural area, at least, property was more evenly divided than would be the case in an industrial community to-day, so that the 9,800 soldiers of the first class need not imply as large a population as it might to-day. Considering the extent of the city walls and the intensive cultivation of the Latin soil, we may accept for the last years of the regal period the tradition of the army of 193 centuries (19,300 men), and conjecture an urban population of about 200,000 and a rural population of about the same size. That the Latin country was at that time intensively cultivated we may well believe, when we recall the long underground drainage channels which were driven through the tufa on the Alban slopes to carry off torrential rain waters in order to save the surface soil from erosion. Such expensive work of salvage would not have been undertaken unless

summoned by the last Tarquin. A large industrial class must have come into existence in the city in the regal period, for even though the walls were raised by forced citizen-labour as tradition held, the increase in trade at the Roman market, the manufacture of the elaborate decorations for the new buildings, the service of a luxurious court, the provisioning and equipping of a large army would require much skilled labour. In some of the regions of Latium taken by force it is probable that the natives were reduced to serfdom as had been the custom in various parts of Etruria. The long and expensive drainage canals that are found between the Alban hills and the sea are not explicable in a system of small free farmers. In that region at least there must have been one or more strong lords who commanded much labour and capital. Whether the prince retained the land as a royal domain or assigned it as fiefs to favourites we have no means of knowing, and we must also admit that no conclusive evidence survived in Roman custom of the servile system which is frequently posited for this period.

This foreign régime also accounts for certain changes in rites, customs and institutions that were more or less lasting. The Etruscans had usually accepted the Italic deities from their subjects, but having come from the East and imbued with anthropomorphic conceptions they made representations of these deities in bronze or terra-cotta and built temples for them. Since such representations were usually derived from figures of Greek gods this process not only localized and gave human form to the Italic deities, but syncretized them with definite Greek gods regarding whom there existed a mythology. In this respect therefore the intervention of the Etruscans completely revolutionized the ideas of the younger generation of Romans. The Etruscans also lent their influence to the growing custom of inhoming the dead, and, for a while at least, to the interment of costly adornments with the body. Since the Etruscan burial rites—brought from Asia—were definitely connected with beliefs of the survival of the *genius* in a state of happiness or suffering, the Italic ideas of future existence were thus permanently altered, even though the Republican Government when restored tried to abolish funeral adornments and encourage a return to the Italic burial customs. That the Latin language was not displaced at Rome even in official regal inscriptions is proved by the survival of the famous "stele" of the forum, which is written in Latin though on an Etruscan stone and containing a reference to the king.

Expulsion of the King.—Near the end of the 6th century the Etruscan usurpers were ejected and a republican government formed with a restoration of annual elective magistrates, an advisory senate of nobles and a timocratic popular assembly. The traditional date is 509 B.C., but since the chronology adopted by later writers is a reconstruction from consular lists and from the marks made every year on the doorposts of the Capitoline temple, and since a discrepancy of a few years existed between these two records, we must not insist upon exact dates. Livy attributes the revolt against the Tarquins to a general objection to forced labour on public buildings and in the last instance to the wrong done to Lucretia by a son of the king. That tradition should have kept an accurate and adequate explanation of causes for several hundred years is not plausible, but in view of the evidence of archaeology and of institutional survivals we cannot doubt that Etruscan princes held Rome for a while and that they were ejected with a restoration of native rule.

II. THE REPUBLIC

Period A: 509–265 B.C.—(a) The Struggle Between the Orders.—The Tarquins apparently did not at once acquiesce in the results of the revolution. Securing the aid of friends in Etruscan cities and also in some Latin towns like Tusculum, still held by friendly princes, they attacked Rome again and again. An Etruscan tradition mentions a temporary victory by Lars Porcenna of Clusium by which he was able to disarm Rome for a while; and as late as 499 there was a famous battle at Lake Regillus in which the Romans won a decisive victory over Etruscan and some Latin forces, and the general on that occasion vowed the temple to Castor in recognition of aid received from

Greek cavalry. Rome also had trouble with the Latin cities, for the new Government attempted to take over the hegemony of the Latin towns that had been subjected by the Tarquins, while these Latin towns also wished a restoration of independence. Rome's wars with the Etruscans made it impossible to enforce her claims over the Latins, and consequently she had to come to terms with them. The independent league of Latin towns¹ consisting of Tibur, Tusculum, Aricia, Lanuvium, Ardea, Pometia and Cora, formed in order to resist Rome's pretensions, soon (c. 493) entered into a defensive alliance with her (the *foedus Cassianum*), and this new league made enough progress at once so that Signia and Norba were settled as common Latin colonies. But the Volscian towns of Antium, Satricum, Velitrae and Tarquinia fell away from Latin connections.

The Government.—The new Government of Rome was more nearly an aristocracy than the old native Italic Governments. During the regal period with its great prosperity, its immigration of labourers, its partial imposition of serfdom, and grants of fiefs and privileges, class distinctions had come into existence. The favoured elders, selected by position, influence and favour for seats in the senate, were now considered a caste apart from the rest and they and their descendants were called patricians (*g.v.*). Since this group seems to have led the revolution and formed the new Government it is not strange that they imposed the requirements that patricians alone could hold the magistracies and priest-hoods and interpret the laws, and that no resolution of the popular assembly should be binding unless ratified by the patrician senators. And when the more influential of the plebeians were enrolled as senators these *conscripsi* apparently were not allowed to participate in the ratification of laws. Economic changes added to the disagreement between the classes. With the departure of the king and his court Rome fell out of the current of sea-going commerce, if we may judge from the evidence of excavations. For a while also trade relations with Etruria were cut off. Building construction which had flourished also soon came to an end. Furthermore when Rome had to surrender her hegemony not only over the Volscians of southern Latium but also over all the towns of central Latium, the profits that had flowed into the city from those regions ceased. There must have been much poverty and a large number of unemployed. And since the laws still permitted imprisonment and under certain conditions enslavement for debts, there arose among the poorer plebeians a demand for political rights with which to win some relief from economic distress. There were still in the vicinity several primitive Latin villages with their old town meetings which reminded the Romans of the old democratic government that had existed before the Etruscan invasion.

In the domain of external politics the 5th century was largely devoted to a reconquest by the league of the parts of Latium which were lost to the Volsci and Aequi during the distressing years of warfare with the Etruscans. In internal politics the plebeians made some progress during the century in their battle for recognition. What the plebeians first asked for was the right to elect advocates (tribunes of the people) who should have the right to prevent arbitrary arrest, and to speak for them in court when arrested. This seems to have been an attempt to find a remedy against harsh debtor-laws, and a substitute for the king who had listened to such appeals. The historians say that the plebeians were not granted this request until they had succeeded to Mons Sacer when called upon for service against the Volsci. The fact that the privilege was granted by a sacred agreement which also invoked a curse upon any who impeded a tribune in the performance of his duty gives evidence that the measure rested upon a solemnly sworn compact between the orders. The story of the political strike is therefore plausible. There may at first have been four tribunes, one for each city tribe; but before the time of the decemvirs there were ten, and this remained henceforth the standing number.

It would be difficult to find a parallel to the tribunate anywhere. The tribune never became, strictly speaking, a magistrate of the Roman people. His one prerogative in the early days was ¹Rosenberg, in *Hermes*, 159 (1919).

to protect individual plebeians against summary arrest by patrician officials and he must exercise this function in person and within the city. That he was sacrosanct and absolutely protected in the performance of his duty clearly points to the intention that in this one function he was to be as efficient a protector of the oppressed individual as the absolute monarch had been. Such powers could hardly be kept from abuse, and in time the tribunes became powerful individuals who could intervene in almost any department of state.

Since the tribunes were elected annually by the plebeians it was only natural that the plebeian assembly—which met by local groups or tribes—might remain to discuss policies and instruct the tribunes by resolution. In 471, if Livy is correct, a law was passed (the *lex Publilia*) which recognized the plebeian tribal assemblies as lawful, and authorized the tribunes to propose and carry resolutions in such assemblies. These resolutions (*plebiscites*) had of course only such force as plebeian influence gave them, but the time was to come when the plebeians were the most powerful element of the state, and when the law-making body dared not resist the demands of plebiscites.

The Twelve Tables.—The plebeians now had advocates in court, but the tribunes were hampered by the fact that court judgments were rendered according to unwritten custom preserved from father to son within a narrow group of learned patricians. It therefore became apparent that the customary law must be codified and posted. After many years of discussion a law was passed substituting for the whole a board of ten patricians in place of the two consuls and authorizing this board of ten to frame and publish a code of laws to be binding upon all. The *decemviri* worked on this code in 451 and 450, when it was inscribed and posted in the Forum. These "XII tables" were in no sense a reform or a liberalizing of old custom. They recognized the prerogatives of the patrician caste and of the patriarchal family, the validity of enslavement for unpaid debt and the interference of religious custom in civil cases. That they reveal a remarkable liberality for their time in respect to testamentary rights and to contracts is probably not due to any alteration brought in by the *decemviri*, but rather to the progress that had been made in commercial customs in the Roman Forum in the days of prosperity and vigorous trade. The gist of this code has survived in quotations and is now the historian's safest index of the state of Rome's culture in the 5th century. (T. F.)

Constitutional Changes.—The *decemviri*, who had incurred much opposition because of their autocratic administration of Rome, were deposed at the demand of the plebeians who seceded to the Janiculum Hill and made a formal demand that the former Government be restored. The assemblies accordingly met and elected consuls and tribunes again. But the plebeian assembly went farther and demanded certain reforms in the constitution. These demands were embodied in the very important Valerio-Horatian laws passed by the popular (centuriate) assembly in 449. These laws granted or reaffirmed the inviolability of the tribunes, the right of every citizen to carry his appeal to the assembly in cases of death sentences, and finally enacted that plebiscites passed by the plebeian assembly should be placed before the senate and if ratified by the *patres* should be recognized as law. Only a few years after the Valerio-Horatian legislation came the *lex Canuleia*, itself a *plebiscitum* (445 B.C.), by which mixed marriages between patricians and plebeians were declared lawful, and the social exclusiveness of the patriciate broken down. In the same year with this measure, and like it in the interests primarily of the wealthier plebeians, a vigorous attack commenced on the patrician monopoly of the consulate, and round this stronghold of patrician ascendancy the conflict raged until the passing of the Licinian laws in 367. The original proposal of the tribune Gaius Canuleius, in 445, that the people should be allowed to elect a plebeian consul was evaded by a compromise. The senate resolved that for the next year, in the stead of consuls, six military tribunes with consular powers should be elected, and that the new office should be open to patricians and plebeians alike. The consulship was thus for the time saved from pollution, as the patricians phrased it, but the growing

strength of the *plebs* is shown by the fact that in 50 years out of the 78 between 444 and 366 they succeeded in obtaining the election of consular tribunes rather than of consuls. Despite, however, these discouragements, the patricians fought on. Each year they strove to secure the creation of consuls rather than consular tribunes, and failing this strained every nerve to secure for their own order at least a majority among the latter. Even the institution of the censorship (435), though rendered desirable by the increasing importance and complexity of the census, was, it is probable, due in part to their desire to discount beforehand the threatened loss of the consulship by diminishing its powers. Other causes, too, helped to protract the struggle. Between the wealthier plebeians, who were ambitious of high office and the poorer, whose minds were set rather on allotments of land recently taken from Veii, there was a division of interest of which the patricians were not slow to take advantage, and to this must be added the pressure of war. The death struggle with Veii and the sack of Rome by the Gauls absorbed for the time all the energies of the community. In 377, however, two of the tribunes, G. Licinius Stolo and L. Sextius, came forward with proposals which united all sections of the *plebs* in their support. Their proposals were as follows: (1) that consuls and not consular tribunes be elected; (2) that one consul at least should be a plebeian; (3) that the priestly college, which had the charge of the Sibylline books, should consist of ten members instead of two, and that of these half should be plebeians; (4) that no single citizen should hold in occupation more than 500 ac. of the common lands, or pasture upon them more than 100 head of cattle and 500 sheep; (5) that interest already paid on debts should be deducted from the principal, and the remainder paid off in three years. The last two proposals were obviously intended to meet the demands of the poorer plebeians, and to secure their support for the first half of the scheme. Ten years of bitter conflict followed, but at last, in 367 B.C., the Licinian rogations became law, and one of their authors, L. Sextius, was created the first plebeian consul. For the moment it was some consolation to the patricians that they not only succeeded in detaching from the consulship the administration of civil law, which was entrusted to a separate officer, *praetor urbanus*, to be elected by the *comitia* of the centuries, with an understanding apparently that he should be a patrician, but also obtained the institution of two additional aediles (*aediles curules*), who were in like manner to be members of their own order. With the opening of the consulship, however, the issue of the long contest was virtually decided, and the next 80 years witnessed a rapid succession of plebeian victories. Now that a plebeian consul might preside at the elections, the main difficulty in the way of the nomination and election of plebeian candidates was removed. The proposed patrician monopoly of the new curule aedileship was almost instantly abandoned. In 356 the first plebeian was made dictator; in 350 the censorship, and in 337 the praetorship was filled for the first time by plebeians; and lastly, in 300, by the *lex Ogulnia*, even the sacred colleges of the pontiffs and augurs, the old strongholds of patrician supremacy, were thrown open to the *plebs*. The patricians lost also the control they had exercised so long over the action of the people in assembly. The *patrum auctoritas*, the sanction given or refused by the patrician senators to laws and to elections, had hitherto been a powerful weapon in their hands. But in 339 a law of Q. Publilius Philo, a plebeian dictator, enacted that this sanction should be given beforehand to laws enacted in the *comitia centuriata*, and a *lex Maenia* of uncertain date extended the rule to elections in the same assembly. Henceforward the *patrum auctoritas* sank into a meaningless form, though as such it still survived in the time of Livy. From 287 onwards it is certain that measures passed by the *plebs*, voting by their tribes, had the full force of laws without any further conditions whatsoever. The legislative independence of the plebeian assembly was secured, and with this crowning victory ended the long struggle between the orders.

(b) **Conquest of Italy.**—Twelve years after the passing of the *lex Hortensia*, King Pyrrhus, beaten at Beneventum, withdrew from Italy, and Rome was left mistress of the peninsula.

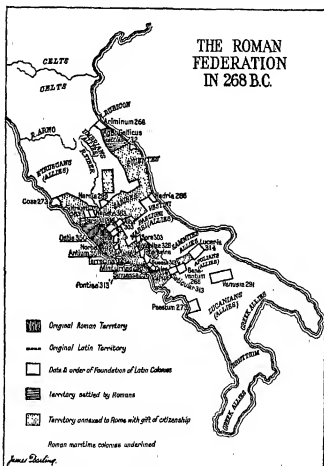

The steps by which this supremacy had been won have now to be traced.

The expulsion of the Tarquins from Rome, followed as it seems to have been by the emancipation from Etruscan supremacy of all the country between the Tiber and the Liris, entirely altered the aspect of affairs. North of the Tiber the powerful Etruscan city of Veii, after a vain attempt to restore the Tarquins, relapsed into an attitude of sullen hostility towards Rome, which, down to the outbreak of the final struggle in 407, found vent in constant and harassing border forays. The Sabines recommenced their raids across the Anio; from their hills to the south-east the Aequi pressed forward as far as the eastern spurs of the Alban range, and ravaged the low country between that range and the Sabine mountains; the Volsci overran the coast-lands as far as Antium, established themselves at Velitæ and even wasted the fields within a few miles of Rome. But the good fortune of Rome did not leave her to face these foes single-handed, and it is a significant fact that the history of the Roman advance begins, not with a brilliant victory, but with a timely alliance. According to Livy, it was in 493, only a few years after the defeat of the prince of Tusculum at Lake Regillus, that a treaty was concluded between Rome and the Latin communities of the Campagna. The alliance was in every respect natural. The Latins were the near neighbours

independently of each other. But, secondly, Rome enjoyed from the first one inestimable advantage. The Latins lay between her and the most active of her foes, the Aequi and Volsci, and served to protect her territories at the expense of their own. Behind this barrier Rome grew strong, and the close of the Aequian and Volscian wars left the Latins her dependents rather than her allies. Beyond the limits of the Campagna Rome found a second ally, hardly less useful than the Latins, in the tribe of the Hernici, in the valley of the Treverus, who had equal reason with the Romans and Latins to dread the Volsci and Aequi, while their position midway between the two latter peoples made them valuable auxiliaries to the lowlanders of the Campagna.

Capture of Veii.—During the period 449–390 there is an unmistakable development of Roman power on all sides. In southern Etruria the capture of Veii (396) virtually gave Rome the mastery as far as the Ciminian forest. Sutrium and Nepesæ, “the gates of Etruria,” became her allies and guarded her interests against any attack from the Etruscan communities to the north, while along the Tiber valley her suzerainty was acknowledged as far as Capena and Falerii. On the Anio frontier we hear of no disturbances from 449 until some ten years after the sack of Rome by the Gauls. In 446 the Aequi appear for the last time before the gates of Rome. After 418 they disappear from Mt. Algidus, and in the same year the communications of Rome and Latium with the Hernici in the Treverus valley were secured by the capture and colonization of Labicum. Successive invasions, too, broke the strength of the Volsci, and in 393 a Latin colony was founded as far south as Circei. In part, no doubt, these Roman successes were due to the improved condition of affairs in Rome itself, consequent upon the great reforms carried between 450 and 442; but it is equally certain that now, as often afterwards, fortune befriended Rome by weakening, or by diverting the attention of, her opponents. In particular, her rapid advance in southern Etruria was facilitated by the heavy blows inflicted upon the Etruscans during the 5th century B.C. by Celts, Greeks and Samnites. By the close of this century the Celts had expelled them from the rich plains of what was afterwards known as Cisalpine Gaul, and were even threatening to advance across the Apennines into Etruria proper. The Sicilian Greeks, headed by the tyrants of Syracuse, wrested from them their mastery of the seas, and finally, on the capture of Capua by the Samnites in 423, they lost their possessions in the fertile Campanian plain. These conquests of the Samnites were part of a great southward movement of the highland Sabellian peoples.

Sack of Rome by the Gauls.—But in 390, or more probably 389, the Roman advance was for a moment checked by a disaster which threatened to alter the course of history in Italy, and which left a lasting impress on the Roman mind. In 391 a Celtic horde left their newly won lands on the Adriatic, and, crossing the Apennines into Etruria, laid siege to the Etruscan city of Clusium (Chusi). Thence, provoked, it is said, by the conduct of the Roman ambassadors, who, forgetting their sacred character, had fought in the ranks of Clusium and slain a Celtic chief, the barbarians marched upon Rome. On July 18, 390 B.C., only a few miles from Rome, was fought the disastrous battle of the Allia. The defeat of the Romans was complete, and Rome lay at the mercy of her foe. But in characteristic fashion the Celts halted three days to enjoy the fruits of victory, and time was thus given to put the Capitol at least in a state of defence. The arrival of the barbarians was followed by the sack of the city, but the Capitol remained impregnable. For seven months they besieged it, and then in as sudden a fashion as they had come they disappeared. The Roman chroniclers explain their retreat in their own way, by the fortunate appearance of M. Furius Camillus with the troops which he had collected, at the very moment when famine had forced the garrison on the Capitol to accept terms. More probably the news that their lands across the Apennines were threatened by the Veneti, coupled with the unaccustomed tedium of a long siege and the difficulty of obtaining supplies, inclined the Celts to accept readily a heavy ransom as the price of their withdrawal. But, whatever the reason, it is certain that they retreated, and, though during the next 50 years marauding

MAP SHOWING GROWTH OF THE ROMAN FEDERATION UP TO 268 B.C.

and kinsmen of the Romans, and both Romans and Latins were just freed from Etruscan rule to find themselves as lowlanders and dwellers in towns face to face with a common foe in the ruder hill tribes on their borders. The exact terms of the treaty cannot, any more than the precise circumstances under which it was concluded, be stated with certainty (see LATIUM), but two points seem clear. There was at first a genuine equality in the relations between the allies; Romans and Latins, though combining for defence and offence, did so without sacrificing their separate freedom of action, even in the matter of waging wars

tribes appeared at intervals in the neighbourhood of Rome, and even once penetrated as far south as Campania (361-360), the Celts never obtained any footing in Italy outside the plains in the north which they had made their own.

Annexation of Southern Etruria.—Nor, in spite of the defeat on the Allia and the sack of the city, was Rome weakened except for the moment by the Celtic attack. The storm passed away as rapidly as it had come on. The city was hastily rebuilt, and Rome dismayed the enemies who hastened to take advantage of her misfortunes by her undiminished vigour. Her conquests in southern Etruria were successfully defended against repeated attacks from the Etruscans to the north. The creation in 387 of four new tribes (Stellatina, Sabatina, Tromentina and Arnensis) marked the final annexation of the territory of Veii and of the lands lying along the Tiber valley. The addition of these tribes, containing Roman settlers as well as Veientes, increased the number and influence of the plebeian group. A few years later Latin colonies were established at Sutrium and Nepes for the more effectual defence of the frontier, and finally, in 353, Caere (q.v.) signed a treaty of peace for 100 years¹.

Next to the settlement of southern Etruria, the most important of the successes gained by Rome between 390 B.C. and 343 B.C. were those won against her old foes the Aequi and Volsci, and her old allies the Latins and Hernicans. The Aequi indeed, already weakened by their long feud with Rome, and hard pressed by the Sabellian tribes in their rear, were easily dealt with, and after the campaign of 389 we have no further mention of an Aequian war until the last Aequian rising in 304. The Volsci, who in 389 had advanced to Lanuvium, were met and utterly defeated by Camillus, the conqueror of Veii, and this victory was followed up by the gradual subjugation to Rome of all the lowland country lying between the hills and the sea as far south as Tarracina. Latin colonies were established at Satricum (385), at Setia (382), and at Antium and Tarracina some time before 348. In 358 two fresh Roman tribes (Pompina and Publilia) were formed in the same district.

Reorganization of the Latin League.—Rome had now nothing more to fear from the foes who a century ago had threatened her very existence. The lowland country, of which she was the natural centre, from the Cimian forest to Tarracina, was quiet, and within its limits Rome was by far the strongest power. But she had now to reckon with the old and faithful allies to whose loyal aid her present position was largely due. The Latini and Hernici had suffered severely in the Aequian and Volscian wars; it is probable that not a few of the smaller communities included in the league had either been destroyed or been absorbed by larger states, and the independence of all alike was threatened by the growing power of Rome. The sack of Rome by the Celts gave them an opportunity of reasserting their independence, and we are consequently told that this disaster was immediately followed by the temporary dissolution of the confederacy, and this again a few years later by a series of actual conflicts between Rome and her former allies. Between 383 and 358 we hear of wars with Tibur, Praeneste, Tusculum, Lanuvium, Circeii and the Hernici. But in all Rome was successful. In 383 Tusculum was fully incorporated with the Roman state by the bestowal of the full franchise; in 358, according to Livy and Polybius, the old alliance was formally renewed with the Latini and the Hernici. We cannot, however, be wrong in assuming that the position of the allies under the new league was far inferior to that accorded them by the treaty of Spurius Cassius. Henceforth they were the subjects rather than the equals of Rome, a position which it is evident that they accepted much against their will, and from which they were yet to make one last effort to escape.

First Samnite War.—Rome had won her supremacy from the Cimian forest to the Liris as the champion of the comparatively civilized communities of the lowlands against the rude highland tribes which threatened to overrun them, and so, when her legions first crossed the Liris, it was in answer to an appeal from a lowland city against invaders from the hills. While she was engaged in clearing Latium of Volsci and Aequi, the Sabellian

tribes of the central Apennines had rapidly spread over the southern half of the peninsula. Foremost among these tribes were the Samnites, a portion of whom had captured the Etruscan city of Capua in 423, the Greek Cumae in 420, and had since then ruled as masters over the fertile Campanian territory. But in their new homes the conquerors soon lost all sense of relationship and sympathy with their highland brethren. They dwelt in cities, amassed wealth, and inherited the civilization of the Greeks and Etruscans whom they had dispossessed; above all, they had before long to defend themselves in their turn against the attacks of their ruder kinsmen from the hills, and it was for aid against these that the Samnites of Campania appealed to the rising state which had already made herself known as the bulwark of the lowlands north of the Liris, and which with her Latin and Hernican allies had scarcely less interest than the Campanian cities themselves in checking the raids of the highland Samnite tribes.

The Campanian appeal was listened to. Rome with her confederates entered into alliance with Capua and the neighbouring Campanian towns, and war was formally declared (343) against the Samnites. While to the Latins and Hernicans was entrusted apparently the defence of Latium and the Hernican valley against the northerly members of the Samnite confederacy; the Romans themselves undertook the task of driving the invaders out of Campania. After two campaigns the war was ended in 341 by a treaty, and the Samnites withdrew from the lowlands, leaving Rome the recognized suzerain of the Campanian cities which had sought her aid.

The Latin War.—There is no doubt that the check thus given by Rome to the advance of the hitherto invincible Sabellian highlanders not only made her the natural head and champion of the low countries, south as well as north of the Liris, but also considerably added to her prestige. Carthage sent her congratulations, and the Etruscan city of Faleri voluntarily enrolled herself among the allies of Rome. Of even greater service, however, was the fact that for 15 years the Samnites remained quiet, for this inactivity, whatever its cause, enabled Rome triumphantly to surmount a danger which threatened for the moment to wreck her whole position. This danger was nothing less than a desperate effort on the part of nearly all her allies and dependents south of the Tiber to throw off the yoke of her supremacy. The way was led by her ancient confederates the Latini, whose smouldering discontent broke into open flame directly the fear of a Samnite attack was removed. From the Latin Campagna and the Sabine hills the revolt spread westwards and southwards to Antium and Tarracina, and even to the towns of the Campanian plain, where the mass of the inhabitants at once repudiated the alliance formed with Rome by the ruling class. The struggle was sharp but short. In two pitched battles the strength of the insurrection was broken, and two more campaigns sufficed for the complete reduction of such of the insurgent communities as still held out. The revolt crushed, Rome set herself deliberately to the task of re-establishing on a new and firmer basis her supremacy over the lowlands, and in doing so laid the foundations of that marvellous organization which was destined to spread rapidly over Italy, and to withstand the attacks even of Hannibal. The old historic Latin league ceased to exist, though its memory was still preserved by the yearly Latin festival on the Alban Mount. Most if not all of the common land of the league became Roman territory; five at least of the old Latin cities were compelled to accept the Roman franchise (Livy viii. 24; Lanuvium, Aricia, Nomentum, Pedum and Tusculum) and enter the rank of the Roman State. The rest, with the Latin colonies, were named as Latin allies of Rome, but on terms which secured their complete dependence upon the sovereign city. The policy of isolation, which became so cardinal a principle of Roman rule, was now first systematically applied. No rights of *consumum* or *commercium* were any longer to exist between these communities. Their federal councils were prohibited, and all federal action independent of Rome forbidden.

In Campania and the coast-lands connecting Campania with Rome, a policy of annexation was considered safer than that of alliance. Of the two frontier posts of the Volsci, Antium and

¹For the status of Caere, see *Klio* xi., 377.

Velitrae, the former was constituted a Roman colony, its long galleys burnt and their prows set up in the Forum at Rome, while the walls of Velitrae were razed to the ground, its leading men banished beyond the Tiber, and their lands given to Roman settlers. Farther south on the route to Campania, Fundi and Formiae were, after the precedent set in the case of Caere, declared Roman and granted the civil rights of Roman citizenship, while lastly in Campania itself the same status was given to Capua, Cumae and the smaller communities dependent upon them¹. During the ten years from 338 to 328 the work of settlement was steadily continued. Tarracina, like Antium, was made a Roman colony. Privernum, the last Volscian town to offer resistance to Rome, was subdued in 330, part of its territory allotted to Roman citizens, and the state itself forced to accept the Roman franchise. Lastly, to strengthen the lines of defence against the Sabellian tribes, two colonies with the rights of Latin allies were established at Cales (334) and at Fregellae (328). The settlement of the lowlands was accomplished. As a single powerful and compact state with an outer circle of closely dependent allies, Rome now stood in sharp contrast with the disunited and degenerate cities of northern Etruria, the loosely organized tribes of the Apennines, and the decaying and disorderly Greek towns of the south.

Second Samnite War.—The strength of this system was now to be tried by a struggle with the one Italian people who were still ready and able to contest with Rome the supremacy of the peninsula. The passive attitude of the Samnites between 342 and 327 was no doubt largely due to the dangers which had suddenly threatened them in South Italy. But the death of Alexander of Epirus, in 332, removed their only formidable opponent there, and left them free to turn their attention to the necessity of checking the steady advance of Rome. In 327, the year after the ominous foundation of a Roman colony at Fregellae, a pretext for renewing the struggle was offered them. The Cumæan colony of Palæopolis had incurred the wrath of Rome by its raids into her territory in Campania. The Samnites sent a force to defend it, and Rome replied by a declaration of war. The two opponents were not at first sight unequally matched, and had the Sabellian tribes held firmly together the issue of the struggle might have been different. As it was, however, the Lucanians to the south actually joined Rome from the first, while the northern clans, Marsi, Vestini, Pæligni and Frentani, after a feeble and lukewarm resistance, subsided into a neutrality which was exchanged in 304 for a formal alliance with Rome. An even greater advantage to Rome from the outset was the enmity existing between the Samnites and the Apulians, the latter of whom from the first joined Rome and thus gave her a position in the rear of her enemy and in a country eminently well fitted for maintaining a large military force. These weaknesses on the Samnite side were amply illustrated by the events of the war.

After several years of partial success, the Romans were thoroughly defeated at Caudine Forks (321) and, in order to save their captured army, were compelled to sign a dishonourable treaty of peace. Rome, however, continued to strengthen her connections with the Lucanians and Apulians, settling a Latin colony at Luceria (314), and to draw the net of alliances more closely by winning over the Vestini and Frentani, north and east of Samnium. The Samnites accordingly, finding that peace was more dangerous than war, renewed hostilities in 316, by making a series of desperate efforts to break through the lines of defence which protected Latium and Campania. Sora and Fregellae on the upper Liris were captured by a sudden attack; the Ausones in the low country near the mouth of the same river were encouraged to revolt by the appearance of the Samnite army; and in Campania another army, attracted by rumours of disturbance, all but defeated the Roman consuls under the very walls of Capua. But these efforts were unavailing. Sora and Fregellae were recovered as quickly as they had been lost, and the frontier there

was strengthened by the establishment of a colony at Interamna. The Ausones were punished by the confiscation of their territory, and Roman supremacy further secured by the two colonies of Suessa and Pontiae (313). The construction of the famous Via Appia, the work of the censor Appius Claudius Cæcus, opened a safe and direct route to Campania, while the capture of Nola deprived the Samnites of their last important stronghold in the Campanian lowlands. The failure of these attempts broke the courage even of the Samnites. Their hopes were indeed raised for a moment by the news that Etruria had risen against Rome (310), but their daring scheme of effecting a union with the Etruscans was frustrated by the energy of the Roman generals. Five years later (305) the Romans revenged a Samnite raid into Campania by an invasion of Samnium itself. Arpinum on the frontier was taken, and at last, after a 22 years' struggle, the second Samnite War was closed by a renewal of the ancient treaty with Rome (304).

The six years of peace which followed (304–298) were employed by Rome in still further strengthening her position. Already, two years before the peace, a rash revolt of the Hernici had given Rome a pretext for finally annexing the territory of her ancient allies. The tribal confederacy was broken up, and all the Hernican communities, with the exception of three which had not joined the revolt, were incorporated with the Roman State as municipia, with the civil rights of the Roman franchise. Between the Hernican valley and the frontiers of the nearest Sabellian tribes lay what remained of the once formidable people of the Aequi. In their case, too, a revolt (304) was followed by the annexation of their territory, which was marked in this case by the formation there (301) of two Roman tribes (Aniensis and Teretina). Not content with thus carrying the borders of their own territory up to the very frontiers of the Sabellian country, Rome succeeded (304) in finally detaching from the Sabellian confederacy all the tribes lying between the north-east frontier of Latium and the Adriatic sea. Henceforward the Marsi, Pæligni, Vestini, Marrucini and Frentani were enrolled among the allies of Rome, and not only swelled her forces in the field but interposed a useful barrier between her enemies to the north in Etruria and Umbria and those to the south in Samnium, while they connected her directly with the friendly Apulians. Lastly, as a security for the fidelity at least of the nearest of these allies, colonies were planted in the Marsian territories at Alba Fucentina (303) and at Carsoli (298). A significant indication of the widening range of Rome's influence in Italy, and of the new responsibilities rapidly pressing upon her, is the fact that when in 302 the Spartan Cleonymus landed in the territory of the Salentini, far away in the south-east, he was met and repulsed by an Italic and Roman force.

Third Samnite War.—Six years after the conclusion of the treaty which ended the second Samnite War, news arrived that the Samnites were harassing the Lucanians. Rome at once interfered to protect her allies. Samnium was invaded in force, the country ravaged and one stronghold after another captured. Unable any longer to hold their own in a position where they were hedged round by enemies, the Samnite leaders turned as a last hope to the communities of northern Etruria, to the free tribes of Umbria and to the once dreaded Celts. With a splendid daring they formed the scheme of uniting all these people with themselves in a last desperate effort to break the power of Rome.

For some 40 years after the final annexation of southern Etruria (351 B.C.) matters had remained unchanged in that quarter. Sutrium and Nepesæ still guarded the Roman frontier; the natural boundary of the Cimbric forest was still intact; and up the valley of the Tiber, Rome had not advanced beyond Falerii, a few miles short of the most southerly Umbrian town Orculum. But in 311, on the expiry, apparently, of the long truce with Rome, concluded in 351, the northern Etruscans, alarmed at the rapid advances which Rome was making farther south, rose in arms and attacked Sutrium. The attack, however, recoiled disastrously upon the heads of the assailants. A Roman force promptly relieved Sutrium, and its leader, Q. Fabius Rullianus, without awaiting orders from home, boldly plunged

¹For the controversy as to the precise status of Capua and the "equites Campani" (Livy viii. 14), see Beloch, *Ital. Bund.* 122 seq.; idem, *Campanien*, 317; Mommsen, *Staatsr.* iii. 574; Frank, *Roman Imperialism*, 41.

into the wilds of the Ciminian forest, and crossing them safely swept with fire and sword over the rich lands to the north. Then turning southwards he met and utterly defeated the forces which the Etruscans had hastily raised in the hopes of intercepting him at the Vadimonian lake. This decisive victory ended the war. The Etruscan cities, disunited among themselves, and enervated by long years of peace, abandoned the struggle for the time, paid a heavy indemnity and concluded a truce with Rome (309-08). In the same year the promptitude of Fabius easily averted a threatened attack by the Umbrians, but Rome proceeded nevertheless to fortify herself in her inviolable fashion against future dangers on this side, by an alliance with Ocriculum, which was founded ten years later (299) by a colony at Narnia, and an alliance with the Picenes, whose position in the rear of Umbria rendered them as valuable to Rome as the Apulians had proved farther south.

Fourteen years had passed since the battle on the Vadimonian lake, when the Samnites appeared on the borders of Etruria and called on the peoples of northern Italy to rise against the common enemy. Their appeal, backed by the presence of their troops, was successful. The Etruscans found courage to face the Roman legions once more; a few of the Umbrians joined them; but the most valuable allies to the Samnites were the Celts, who had for some time threatened a raid across the Apennines, and who now marched eagerly into Umbria and joined the coalition. The news that the Celts were in motion produced a startling effect at Rome, and every nerve was strained to meet this new danger. While two armies were left in southern Etruria as reserves, the two consuls, Q. Fabius Maximus Rullianus and P. Decius Mus the younger, both tried soldiers, marched northwards up the valley of the Tiber and into Umbria at the head of four Roman legions and a still larger force of Italian allies. At Sentinum, on the farther side of the Apennines, they encountered the united forces of the Celts and Samnites, the Etruscans and Umbrians having, it is said, been withdrawn for the defence of their own homes. The battle that followed was desperate, and the Romans lost one of their consuls, Decius, and more than 8,000 men. But the Roman victory was decisive. The Celts were annihilated, and the fear of a second Celtic attack on Rome removed. All danger from the coalition was over. The Etruscan communities gladly purchased peace by the payment of indemnities. The rising in Umbria, never formidable, died away, and the Samnites were left single-handed to bear the whole weight of the wrath of Rome. During four years more, however, they desperately defended their highland homes, and twice at least, in 293 and 292, they managed to place in the field a force sufficient to meet the Roman legions on equal terms. At last, in 290, the consul M. Curius Dentatus finally exhausted their power of resistance. Peace was concluded, and it is significant of the respect inspired at Rome by their indomitable courage that they were allowed to become the allies of Rome, on equal terms and without any sacrifice of independence.

Between the close of the third Samnite War and the landing of Pyrrhus in 281 b.c. we find Rome engaged, as was her wont, in quietly extending and consolidating her power. In southern Italy she strengthened her hold on Apulia by planting on the borders of Apulia and Lucania the strong colony of Venusia. In central Italy the annexation of the Sabine country (290) carried her frontiers eastwards to the borders of her Picentine allies on the Adriatic. Farther east, in the territory of the Picentes themselves, she established colonies on the Adriatic coast at Hecoria and Castrum (286-283). North of the Picentes lay the territories of the Celtic Senones stretching inland to the north-east borders of Etruria, and these too now fell into her hands. Ten years after their defeat at Sentinum (285-284) a Celtic force descended into Etruria, besieged Arretium and defeated the relieving force despatched by Rome. In 283 the consul L. Cornelius Dolabella was sent to avenge the insult. He completely routed the Senones. Their lands were annexed by Rome, and a colony established at Sena on the coast. This success followed as it was by the decisive defeat of the neighbouring tribe of the Boii, who had invaded Etruria and penetrated as far south as the Vadimonian lake,

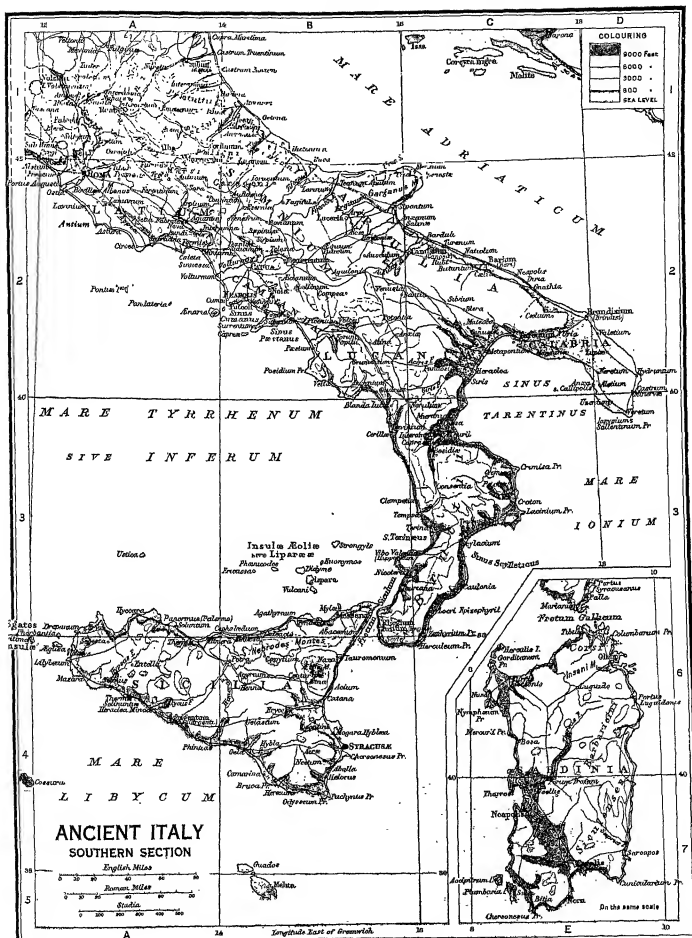

awed the Celts into quiet, and for more than 40 years there was comparative tranquillity in northern Italy.

Pyrrhus.—In the south, however, the claims of Rome to supremacy were now to be disputed by a new and formidable foe. At the close of the third Samnite War the Greek cities on the southern coast of Italy found themselves once more harassed by the Sabelian tribes on their borders, whose energies, no longer absorbed by the long struggles in central Italy, now found an attractive opening southwards.

The city of Thurii appealed to Rome for protection, and the plebeian assembly at Rome—recently given full legislative powers by the Hortensian law—voted to send the consul Fabricius to aid the Greeks. The consul easily routed the barbarians and established a garrison in the city. Thurii thus accepted Rome's suzerainty. The Tarentines, who claimed to be the protectors of the Greeks in Italy, were offended at the course taken by Thurii, and rightly feared that Rome's advance to the sea would soon compel all the cities of Magna Græcia to acknowledge the dominance of Rome's influence. While the Tarentines were debating whether to protest, several Roman ships (presumably of the *socii navales*), bound for the Adriatic colonies of Rome, appeared off the harbour of Tarentum. Since the Romans had long before signed a treaty that no Roman ships of war should sail east of the Iacintian cape, the Tarentines regarded the appearance of this squadron as a hostile act, attacked it, killed the admiral and sank most of the ships. Rome, desiring peace, asked for reparations without making a hostile demonstration, but the democratic party in Tarentum, bent upon asserting the independence and power of their city, engaged King Pyrrhus of Epirus to come to their aid and, in reliance upon his forces, declared war upon Rome (281).

King Pyrrhus (*see* PYRRHUS), whose timely appearance seemed for the moment to have saved the independence of Tarentum, was the most brilliant of the military adventurers whom the disturbed times following the death of Alexander the Great had brought into prominence. High-spirited, generous and ambitious, he had formed the scheme of rivaling Alexander's achievements in the East, by winning for himself an empire in the West. He aspired not only to unite under his rule the Greek communities of Italy and Sicily, but to overthrow the great Phœnician state of Carthage—the natural enemy of Greeks in the West, as Persia had been in the East. Of Rome it is clear that he knew little or nothing; the task of ridding the Greek seaports of their barbarian foes he no doubt regarded as an easy one; and the splendid force he brought with him was intended rather for the conquest of the West than for the preliminary work of chastising a few Italian tribes, or securing the submission of the unworthy Italian Greeks. He defeated the Roman consul, M. Valerius Laevinus, on the banks of the Siris (280), and gained the support of the Greek cities as well as that of numerous bands of Samnites, Lucanians and Brutians. But, to the disappointment of his new allies, Pyrrhus showed no anxiety to follow up his advantage. His heart was set on Sicily and Africa, and his immediate object was to come to terms with Rome. But though he advanced as near Rome as Anagnina (279), nothing could shake the resolution of the senate, and in the next year (278) he again routed the legions at Asculum (Ascoli), but only to find that the indomitable resolution of the enemy was strengthened by defeat. He now crossed into Sicily, where, though at first successful, he was unable to achieve any lasting result. Soured and disappointed, Pyrrhus returned to Italy (276) to find the Roman legions steadily moving southwards, and his Italian allies disgusted by his desertion of their cause. In 275 the decisive battle of the war was fought at Beneventum. The consul M. Curius Dentatus, the conqueror of Samnium, gained a complete victory and Pyrrhus, unable any longer to face his opponents in the field, and disappointed of all assistance from his allies, retreated in disgust to Tarentum and thence crossed into Greece.

A few years later (272) Tarentum was surrendered to Rome by its Epirot garrison; it was granted a treaty of alliance, but its walls were razed and its fleet handed over to Rome. In 270 Rhegium also entered the ranks of Roman allies, and finally in 269 a single campaign crushed the last efforts at resistance in Sam-

nium. Rome was now at leisure to consolidate the position she had won. Between 273 and 263 three new colonies were founded in Samnium and Lucania—Paestum in 273, Beneventum in 268, Aesernia in 263. In central Italy the area of Roman territory was increased by the full enfranchisement (268) of the Sabines, and of their neighbours to the east, the people of Picenum. To guard the Adriatic coast, colonies were established at Ariminum (268), at Firmum and at Castrum Novum (264), while to the already numerous maritime colonies was added that of Cosa in Etruria.

Rome the Mistress of Italy.—Rome was now the undisputed mistress of Italy. The limits of her supremacy to the north were represented roughly by a line drawn across the peninsula from the mouth of the Arnus on the west to that of the Aesis on the east. Beyond this line lay the Ligurians and the Celts; all south of it was now united as "Italy" under the rule of Rome.

But the rule of Rome over Italy, like her wider rule over the Mediterranean coasts, was not an absolute dominion over conquered subjects. It was in form at least a confederacy under Roman protection and guidance; and the Italians, like the provincials, were not the subjects, but the "allies and friends" of the Roman people. In the treatment of these allies Rome consistently followed the maxim, *divide et impera*. In every possible way she strove to isolate them from each other, while binding them closely to herself. The old federal groups were in most cases broken up, and each of the members united with Rome by a special treaty of alliance. In Etruria, Latium, Campania and Magna Graecia the city was taken as the unit; in central Italy where urban life was non-existent, the unit was the tribe. The northern Sabellian peoples, for instance—the Marsi, Pedegni, Vestini, Marrucini and Frontani—were now constituted as separate communities in alliance with Rome. In many cases, too, no freedom of trade or intermarriage was allowed between the allies themselves. Nor were all these numerous allied communities placed on the same footing as regarded their relations with Rome herself. To begin with, a sharp distinction was drawn between the "Latini" and the general mass of Italian allies. The "Latins" of this period had little more than the name in common with the old 30 Latin peoples of the days of Spurius Cassius. With a few exceptions, such as Tibur and Praeneste, the latter had either disappeared or had been incorporated with the Roman State, and the Latins of 268 B.C. were almost exclusively the "Latin colonies," that is to say, communities founded by Rome, composed partly of allies but chiefly of men of Roman blood, and whose only claim to the title "Latin" lay in the fact that Rome granted to them some portion of the rights and privileges formerly enjoyed by the old Latin cities under the Cassian treaty. Though nominally allies, they were in fact offshoots of Rome herself, bound to her by community of race, language and interest, and planted as Roman garrisons among alien and conquered peoples. The Roman citizen who joined a Latin colony lost his citizenship;—Rome allowed him to retain it would no doubt have been regarded as enlarging too rapidly the limits of the citizen body; but he received in exchange the status of a favoured ally. The member of a Latin colony had the right of *commercium* and down to 268 of *conjugium* also with Roman citizens. Provided they left sons and property to represent them at home, they were free to migrate to Rome and acquire the Roman franchise. In war-time they not only shared in the booty, but claimed a portion of any land confiscated by Rome and declared "public." These privileges, coupled with their close natural affinities with Rome, successfully secured the fidelity of the Latin colonies, which became not only the most efficient troops of Roman supremacy, but powerful agents by which to back up Roman dictation. But the privileges I have named the Latin cities and their allies were known generally to them as *foederati*—the children of a sister community. It took even by the terms of their respective treaties with Rome. We are told that the Greek cities of Neapolis and Thurac, some among the most important, by their alliance with Rome had been, even before the Hannibalic War, in a sense been so completely treated that they were no longer considered *foederati*.

Rome, however, did not rely only on this policy. Her allies

were attached as closely to herself as they were clearly separated from each other, and from the first she took every security for the maintenance of her own paramount authority. Within its own borders, each ally was left to manage its own affairs as an independent State. The badges which marked subjection to Rome in the provinces—the resident magistrate and the tribute—were unknown in Italy. But in all points affecting the relations of one ally with another, in all questions of the general interests of Italy and of foreign policy, the decision rested solely with Rome. The plan of a federal constitution, of a federal council, of federal officers, was flung by the Roman senate, assembly and magistrates. The maintenance of peace and order in Italy, the defence of the coasts and frontiers, the making of war or peace with foreign Powers, were matters the settlement of which Rome kept entirely in her own hands. Each allied State, in time of war, was called upon for a certain contingent of men, but, though its contingent usually formed a distinct corps under officers of its own, its numerical strength was fixed by Rome, it was brigaded with the Roman legions, and was under the orders of the Roman consul.

The Roman State.—This paramount authority of Rome throughout the peninsula was confirmed and justified by the fact that Rome herself was now infinitely more powerful than any one of her numerous allies. Her territory, as distinct from that of the allied States, covered something like one-third of the peninsula south of the Aesis. Along the west coast it stretched from Caere to the southern borders of Campania. Inland, it included the former territories of the Aequi and Hernici, the Sabine country, and even extended eastwards into Picenum, while beyond these limits were outlying districts, such as the lands of the Senonian cities, with the Roman colony of Sena, and others elsewhere in Italy, which had been confiscated by Rome and given over to Roman settlers. Since the first important annexation of territory after the capture of Veii (396), 12 new tribes had been formed, and the number of male citizens registered at the census had risen from 152,000 to 290,000. Within this enlarged Roman State were now included numerous communities with local institutions and government. At their head stood the Roman colonies (*coloniae civium Romanorum*), founded to guard especially the coasts of Latium and Campania. Next to these eldest children of Rome came those communities which had been invested with the full Roman franchise, such, for instance, as the old Latin towns of Aricia, Lanuvium, Tusculum, Nomentum and Pedum. Lowest in the scale were those which had not been considered ripe for the full franchise, but had, like Caere, received instead the *civitas sine suffragio*, the civil without the political rights. Their members, though Roman citizens, were not enrolled in the tribes, and in time of war served not in the ranks of the Roman legions but in separate contingents. In addition to these organized town communities, there were also the groups of Roman settlers on the public lands, and the dwellers in the village communities of the mountainous highland districts in central Italy.

The administrative needs of this enlarged Rome were obviously such as could not be adequately satisfied by the system which had done well enough for a small city State with a few square miles of territory. The old centralization of all government in Rome itself had become an impossibility, and the Roman statesmen did their best to meet the altered requirements of the time. The urban communities within the Roman pale, colonies and *municipia*, were allowed a large measure of local self-government. In all we find local assemblies, senates and magistrates, to whose hands the ordinary routine of local administration was confided, and, in spite of differences in detail, *e.g.*, in the titles and numbers of the magistrates, the same type of constitution prevailed throughout. But these local authorities were carefully subordinated to the higher powers in Rome. The local constitution could be modified or revoked by the Roman senate and assembly, and the local magistrates, no less than the ordinary members of the community, were subject to the paramount authority of the Roman consuls, praetors and censors. In particular, care was taken to keep the administration of justice well under central control. The Roman citizen in a colony or *municipium* enjoyed, of course, the right of appeal of the Roman people in a capital

case. We may also assume that from the first some limit was placed to the jurisdiction of the local magistrate, and that cases falling outside it came before the central authorities. But an additional safeguard for the equitable and uniform administration of Roman law, in communities to many of which the Roman code was new and unfamiliar, was provided by the institution of *prefects (praefecti iuri dicundo)*, who were sent out annually, as representatives of the Roman praetor, to administer justice in the colonies and *municipia*. To prefects, moreover, were assigned the charge of those districts within the Roman pale where no urban communities, and consequently no organized local government, existed. In these two institutions, that of municipal government and that of prefectures, we have already two of the cardinal points of the later imperial system of government.

Lastly, the changes which the altered position and increased responsibilities of Rome had effected in her military system tended to weaken the intimate connection between the Roman army in the field and the Roman people at home, and thus prepared the way for that complete breach between the two which in the end proved fatal to the republic. It is true that service in the legion was still the first duty and the highest privilege of the fully qualified citizen. But this service was gradually altering in character. Though new legions were still raised each year for the summer campaigns, this was by no means always accompanied, as formerly, by the disbandment of those already on foot, and this increase in the length of time during which the citizen was kept with the standards had, as early as the siege of Veii, necessitated a further deviation from the old theory of military service—the introduction of pay. Moreover, while in the early days of the republic the same divisions served for the soldier in the legion and the citizen in the assembly, in the new manipular system, with its three lines, no regard was paid to civic distinctions, but only to length of service and military efficiency, while at the same time the more open order of fighting which it involved demanded of each soldier greater skill, and therefore a more thorough training in arms than the old phalanx. One other change resulted from the new military necessities of the time, which was as fruitful of results as the incipient separation between the citizen and the soldier. Under the early republic, the chief command of the legions rested with the consuls of the year. But, as Rome's military operations increased in area and in distance from Rome, a larger staff became necessary, and the inconvenience of summoning home a consul in the field from an unfinished campaign became intolerable. The remedy found, that of prolonging for a further period the imperium of the consul, was first applied in 327 B.C. in the case of Q. Publilius Philo, and between 327 and 264 instances of this *prorogatio imperii* became increasingly common. This proconsular authority, originally an occasional and subordinate one, was destined to become first of all the strongest force in the Republic, and ultimately the chief prop of the power of the Caesars.

Period B: Rome and the Mediterranean States, 265–146 B.C.—(a) *Conquest of the West.*—Though marked out by her geographical position as the natural centre of the Mediterranean, Italy had hitherto played no active part in the Mediterranean politics, but, now that she was for the first time united, it was felt throughout the Mediterranean world that a new Power had arisen, and Rome, as the head and representative of Italy, found herself irresistibly drawn into the vortex of Mediterranean affairs. Egypt sought her alliance, and Greek scholars began to interest themselves keenly in the history, constitution and character of the Latin republic which had so suddenly become famous. But Rome looked naturally westwards rather than eastwards. The western coasts of the peninsula were the most fertile and populous and wealthy; and it was in this direction that the natural openings for Italian commerce were to be found. It was, however, precisely on this side that Rome had serious ground for anxiety. Carthage was now at the height of her power. Her outposts were threateningly near to Italy in Sardinia and in Sicily, while her fleets swept the seas and jealously guarded for the benefit of Carthage alone the hidden treasures of the West. In the east of Sicily, Syracuse still upheld the cause of Greek independence against

the hereditary foe of the Greek race; but Syracuse stood alone, and her resources were comparatively small. What Rome had to fear was the establishment, and that at no distant date, of an absolute Carthaginian domination over the western seas—a domination which would not only be fatal to Italian commerce, but would be a standing menace to the safety of the Italian coasts.

First Punic War, 265–241.—It was above all things essential for Rome that the Carthaginians should advance no farther eastwards. But in 265 Rome was threatened with the establishment of Carthaginian rule at Messana, within sight of the Italian coast. The intervention of both powers in a quarrel between the Mamertines, a body of Campanian mercenaries who had occupied Messana, and Hieron II of Syracuse, led to the outbreak of war between Rome and Carthage in 264 B.C. The military history of the struggle which followed is treated in the article PUNIC WARS; it will suffice to note here that the war lasted until 241 B.C., when the Carthaginians were compelled to cede Sicily and the Lipari islands to Rome, and to pay an indemnity of 3,200 talents (about £800,000).

The struggle was one in which both Rome and Carthage were serving an apprenticeship in a warfare the conditions of which were unfamiliar to both. The Roman legions were foes very unlike any against which the Carthaginian leaders had ever led their motley array of mercenaries, while Rome was called upon for the first time to fight a war across the sea, and to fight with ships against the greatest naval power of the age. The chief dangers for Carthage lay obviously in the jealousy exhibited at home of her officers abroad, in the difficulty of controlling her mercenary troops, and in the ever-present possibility of disaffection among her subjects in Libya—dangers which even the genius of Hannibal failed finally to surmount. Rome, on the other hand, was strong in the public spirit of her citizens, the fidelity of her allies, the valour and discipline of her legions. What she needed was a system which would make a better use of her splendid materials than one under which her plans were shaped from day to day by a divided senate, and executed by officers who were changed every year, and by soldiers most of whom returned home at the close of each summer's campaign.

The interval between the first and second Punic Wars was employed by both Rome and Carthage in strengthening their respective positions. The eastern end of Sicily was still left under the rule of Hieron as the ally of Rome, but the larger western portion of the island became directly subject to Rome, and a temporary arrangement seems to have been made for its government, either by one of the two praetors, or possibly by a quaestor. Sardinia and Corsica had not been surrendered to Rome by the treaty of 241, but three years later (239), on the invitation of the Carthaginian mercenaries stationed in the islands, a Roman force occupied them; Carthage protested, but, on the Romans threatening war, she gave way, and Sardinia and Corsica were formally ceded to Rome, though it was some seven or eight years before all resistance on the part of the natives themselves was crushed. In 227, however, the senate considered matters ripe for the establishment of a separate administration in her overseas possessions. In that year two additional praetors were elected; to one was assigned the charge of western Sicily, to the other that of Sardinia and Corsica, and thus the first stones of the Roman provincial system were laid. Of at least equal importance for the security of the peninsula was the subjugation of the Celtic tribes in the valley of the Po. These, headed by the Boii and Insubres and assisted by levies from the Celts to the westward, had in 225 alarmed the whole of Italy by invading Etruria and penetrating to Clusium, only three days' journey from Rome. Here, however, their courage seems to have failed them. They retreated northwards along the Etruscan coast, until at Telamon their way was barred by the Roman legions returning from Sardinia to the defence of Rome, while a second consular army hung upon their rear. Thus hemmed in, the Celts fought desperately, but were completely defeated and the flower of their tribesmen slain. The Romans followed up their success by invading the Celtic territory. The Boii were easily reduced to submission. The Insubres, north of the Po, resisted more obstinately, but by 222 the war was over,

and all the tribes in the rich Po valley acknowledged the supremacy of Rome. The conquered Celts were not enrolled among the Italian allies of Rome, but were treated as subjects beyond the frontier. Two colonies were founded to hold them in check—Placentia (218) and Cremona in the territory of the Insubres—and the great northern road (Via Flaminia) was completed as far as the Celtic border at Ariminum.

On the Adriatic coast the immediate interests of Rome were limited to rendering the sea safe for Italian trade. It was with this object that, in 229, the first Roman expedition crossed the Adriatic, and inflicted severe chastisement on the Illyrian pirates of the opposite coast. This expedition was the means of establishing for the first time direct political relations between Rome and the states of Greece proper, to many of which the suppression of piracy in the Adriatic was of as much importance as to Italy. Alliances were concluded with Corcyra, Epidamnus and Apollonia; and embassies explaining the reasons which had brought Roman troops into Greece were sent to the Aetolians, the Achaeans and even to Athens and Corinth. Everywhere they were well received, and the admission of the Romans to the Isthmian games (228) formally acknowledged them as the natural allies of the free Greek states against both barbarian tribes and foreign despots. Meanwhile Carthage had acquired a possession which promised to compensate her for the loss of Sicily, Sardinia and Corsica. The genius of her greatest citizen and soldier, Hamilcar Barca, had appreciated the enormous value of the Spanish peninsula, and conceived the scheme of founding there a Carthaginian dominion which should not only add to the wealth of Carthage, but supply her with a base of operations for a war of revenge with Rome. The conquest of southern and eastern Spain, begun by Hamilcar (236-228) and carried on by his kinsman Hasdrubal (228-221), was completed by his son Hannibal, who, with all his father's genius, inherited also his father's hatred of Rome, and by 219 the authority of Carthage had been extended as far as the Ebro (*see SPAIN, History*). Rome's ancient ally Massilia (*mod. Marseilles*) was especially disturbed by these advances, for she had trading posts on the coast of Spain which would become unprofitable if Carthage conquered the whole of the interior and drew the commerce of the peninsula southwards to the Punic ports. Furthermore, since Carthage forbade Massiliot traders to make use of the straits of Gibraltar, Massiliot trade in British tin would be endangered if Carthage succeeded in reaching southern Gaul. From the fact that Marseilles lent her whole navy to Rome when the war broke out we may assume that her envoys were active in reporting the advance of Carthage in Spain and in interpreting that advance as aimed at Rome. Rome finally was induced to act. A defensive alliance was signed with Saguntum, a seaport of Spain which was still independent, and Hasdrubal was asked to promise that Carthage should not carry her arms beyond the Ebro river (226).

Second Punic War, 218-201.—But these precautions were of no avail against the resolute determination of Hannibal, with whom the conquest of Spain was only preliminary to an attack upon Italy, and who could not afford to leave behind him in Spain a state allied to Rome. In 219, therefore, disregarding the protests of a Roman embassy, he attacked and took Saguntum, an act which, as he had foreseen, rendered a rupture with Rome inevitable, while it set his own hands free for a further advance.

For the details of the war which followed, *see the articles PUNIC WARS; HANNIBAL; and SCIPIO, PUBLIUS CORNELIUS*. From the outbreak of hostilities until the crowning victory of Cannae in 216 Hannibal's career of success was unchecked; and his conduct of the Roman army in that battle was followed by the surrender of almost the whole of southern Italy, with the exception of the Etruscan cities and the Greek coast towns. In 215, moreover, Philip V. of Macedonia formed an alliance with Hannibal, and, having invaded Italy in 214, was victorious, and in 212 he Greek cities in northern Italy were overthrown. But the indomitable spirit of the Roman senate served itself in the face of these crushing misfortunes. In 213 Syracuse was recovered. In 211 Capua fell after a long siege which Hannibal failed to raise, even by his famous march up to the gates of

Rome, and in the same year a coalition was formed in Greece against Philip V. of Macedonia, which effectually paralysed his offensive action. Hannibal was now confined to Lucania and Bruttium; and his brother Hasdrubal, marching from Spain to join him, was defeated and slain on the river Metaurus (207). The war in Italy was now virtually ended, for, though during four years more Hannibal stood at bay in a corner of Bruttium, he was powerless to prevent the restoration of Roman authority throughout the peninsula. Sicily was once more secure; and finally in 206, the year after the victory on the Metaurus, the successes of the young P. Scipio in Spain (211-206) were crowned by the complete expulsion of the Carthaginians from the peninsula. On his return from Spain Scipio eagerly urged an immediate invasion of Africa. The senate hesitated; but Scipio gained the day. He was elected consul for 205, and given the province of Sicily, with permission to cross into Africa if he thought fit. Voluntary contributions of men, money and supplies poured in to the support of the popular hero; and by the end of 205 Scipio had collected in Sicily a sufficient force for his purpose. In 204 he crossed to Africa, where he was welcomed by the Numidian prince Massinissa, whose friendship he had made in Spain. In 203 he twice defeated the Carthaginian forces, and a large party at Carthage were anxious to accept his offer of negotiations. But the advocates of resistance triumphed.

Hannibal was recalled from Italy, and returned to fight his last battle against Rome at Zama, where Scipio, who had been continued in command as proconsul for 202 by a special vote of the people, won a complete victory. The war was over. The Roman assembly voted that the Carthaginian request for peace should be granted, and entrusted the settlement of the terms to Scipio and a commission of ten senators. Carthage was allowed to retain her territory in Africa; but she undertook to wage no wars outside Africa, and none inside without the consent of Rome. She surrendered all her ships but ten triremes, her elephants, and all prisoners of war, and agreed to pay an indemnity of 10,000 talents in 50 years. The Numidian Massinissa (*q.v.*) was rewarded by an increase of territory, and was enrolled among the 'allies and friends' of the Roman people.

The West Under Roman Rule.—The battle of Zama decided the fate of the West. The power of Carthage was broken and her supremacy passed to Rome. Henceforth Rome had no rival to fear westward of Italy, and it rested with herself to settle within what limits her supremacy should be confined and what form it should take. In Sicily the former dominions of Hieron were at once united with the western half of the island as a single province, and in Spain, after nine years of a provisional Government (206-197), two provinces were in 197 definitely established, and each, like Sicily, assigned to one of the praetors for the year, two additional praetors being elected for the purpose. But here the resemblance between the two cases ends. From 201 down to the outbreak of the Slave War in 136 there was unbroken peace in Sicily, and its part in the history is limited to its important functions in supplying Rome with corn and in provisioning and clothing the Roman legions. The governors of the two Spains had very different work to do from that which fell to the lot of the Sicilian praetors. The condition of Spain required that year after year the praetors should be armed with the consular authority, and backed by a standing force of four legions, while more than once the presence of the consuls themselves was found necessary. Still, in spite of all difficulties, the work of pacification proceeded. To M. Porcius Cato (consul, 195) and to Tiberius Sempronius Gracchus (praetor and pro-praetor, 180-179), father of the two tribunes, is mainly due the credit of quieting the Celtiberian tribes of central Spain, and the government of Gracchus was followed by 30 years of comparative tranquillity. The insurrection headed by Viriathus in 149 was largely caused by exactions of the Roman magistrates themselves, while its obstinate continuance down to the capture of Numantia, in 133, was almost as much the result of the incapacity of the Roman commanders. But the re-settlement of the country by Scipio Africanus the younger in that year left all Spain, with the exception of the highland Astures and Cantabri in the north-west, finally and tranquilly subject to

Rome.

Third Punic War, 153-146.—In Africa there was no question at first of the introduction of Roman government by the formation of a province (see AFRICA, ROMAN). Carthage, bound hand and foot by the treaty of 201, was placed under the jealous watch of the loyal prince of Numidia, who himself willingly acknowledged the suzerainty of Rome. But it was impossible for this arrangement to be permanent. Every symptom of reviving prosperity at Carthage was regarded at Rome with feverish anxiety, and neither the expulsion of Hannibal in 195 nor his death in 183 did much to check the growing conviction that Rome would never be secure while her rival existed. It was therefore with grim satisfaction that many in the Roman senate watched the increasing irritation of the Carthaginians under the harassing raids and encroachments of their favoured neighbor Massinissa, and waited for the moment when Carthage should, by some breach of the conditions imposed upon her, supply Rome with a pretext for interference. At last in 151 came the news that Carthage, in defiance of treaty obligations, was actually at war with Massinissa. The anti-Carthaginian party in the senate, headed by M. Porcius Cato, eagerly seized the opportunity, and war was declared, and nothing short of the destruction of their city itself was demanded from the despairing Carthaginians. The demand was refused and in 149 the siege of Carthage began. During the next two years little progress was made, but in 147 P. Cornelius Scipio Aemilianus, grandson by adoption of the conqueror of Hannibal, was, at the age of 37, and though only a candidate for the aedileship, elected consul and given the command in Africa. In the next year (146) Carthage was taken and razed to the ground. Its territory became the Roman province of Africa, while Numidia, now ruled by the three sons of Massinissa, remained as an allied state under Roman suzerainty, and served to protect the new province against the raids of the desert tribes (see CARTHAGE).

In Italy itself the Hannibalic War had been followed by important changes. In the north the Celtic tribes paid for their sympathy with Hannibal by the final loss of all separate political existence. Cispadane Gaul, studied with colonies and flooded with Roman settlers, was rapidly Romanized. Beyond the Padus (Po) in Polybius's time Roman civilization was already widely spread. In the extreme north-east the Latin colony of Aquileia, the last of its kind, was founded in 181, to control the Alpine tribes, while in the north-west the Ligurians were held in check by the colony of Luna (180), and by the extensive settlements of Roman citizens and Latins made on Ligurian territory in 173. In southern Italy the depression of the Greek cities on the coast, begun by the raids of the Sabelian tribes, was completed by the repeated blows inflicted upon them during the Hannibalic struggle. Some of them lost territory¹; all suffered from a decline of population and loss of trade; and their place was taken by such new Roman settlements as Brundisium (Brindisi) and Puteoli (Positano). In the interior the southern Sabelian tribes suffered scarcely less severely. The Brutii were struck off the list of Roman allies, and nearly all their territory was confiscated. To the Apulians and Lucanians no such hard measure was meted out; but their strength had been broken by the war, and their numbers dwindled; large tracts of land in their territories were seized by Rome, and allotted to Roman settlers, or occupied by Roman speculators. That Etruria also suffered from declining energy, a dwindling population, and the spread of large estates is clear from the state of things existing there in 133. It was indeed in central Italy, the home of the Latins and their nearest kinsmen, and in the new Latin and Roman settlements throughout the peninsula, that progress and activity were henceforth concentrated.

(b) **Rome in the East, 200-133.**—Ever since the repulse of Pyrrhus from Italy, Rome had been slowly drifting into closer contact with the eastern states. With one of the three great powers which had divided between them the empire of Alexander, with Egypt, she had friendly relations since 273, and the friendship had been cemented by the growth of commercial intercourse

between the two countries. In 228 her chastisement of the Illyrian pirates had led naturally enough to the establishment of friendly relations with some of the states of Greece proper. In 214 the alliance between Philip V. and Hannibal, and the former's threatened attack on Italy, forced her into war with Macedonia, at the head of a coalition of the Greek states against him, which effectually frustrated his designs against herself; at the first opportunity, however (205), she ended the war by a peace which left the position unchanged. The results of the war were not only to draw closer the ties which bound Rome to the Greek states, but to inspire the senate with a genuine dread of Philip's restless ambition, and with a bitter resentment against him for his union with Hannibal. The events of the next four years served to deepen both these feelings. In 205 Philip entered into a compact with Antiochus III. of Syria for the partition between them of the dominions of Egypt, now left by the death of Ptolemy Philopator to the rule of a boy-king. Antiochus was to take Coele-Syria and Phoenicia, while Philip claimed for his share the districts subject to Egypt on the coasts of the Aegean and the Greek islands. Philip no doubt hoped to be able to secure these unlawful acquisitions before the close of the second Punic War should set Rome free to interfere with his plans. But the obstinate resistance offered by Attalus of Pergamum and the Rhodians upset his calculations. In 201 Rome made peace with Carthage, and the senate had leisure to listen to the urgent appeal for assistance which reached her from her Eastern allies. With Antiochus indeed the senate was not yet prepared to quarrel; but with Philip the senate was ready to have a serious discussion despite the depletion of all resources. Philip had compelled Rome to give way to him in Illyricum, and he had proved by his attack on Egypt that he would prove to be a dangerous neighbour in time of peril. Furthermore philhellennism had grown very strong at Rome since Livius, Naevius and Ennius had translated scores of Greek plays for production at the Roman festivals. To the nobles who were now eagerly reading Homer, Plato and Euripides, the appeal of the old Greek cities for protection of independence, democracy and culture in Greece came to open ears. The people, to be sure, remembering all too well what they had suffered in the last war, at first rejected the senate's proposal to aid the Greeks, but the nobles, insisting that postponement would only result in a Macedonian invasion of Italy, finally secured a declaration of war (200).

Second Macedonian War, 200-197.—The war began in the summer of 200 B.C., and, though the landing of the Roman legions in Epirus was not followed, as had been hoped, by any general rising against Philip, yet the latter made no progress south of Boeotia. The fleets of Pergamum and Rhodes, now the zealous allies of Rome, protected Attica and watched the eastern coasts. The Achaeans and Nabai of Sparta were obstinately neutral, while nearer home in the north the Epirotes and Aetolians threatened Thessaly and Macedonia. His own resources both in men and in money had been severely strained by his constant wars, and the only ally who could have given him effective assistance, Antiochus, was fully occupied with the conquest of Coele-Syria. It is no wonder then that, in spite of his dashing generalship and high courage, he made but a brief stand. T. Quinctius Flaminius (consul, 198), in his first year of command, defeated him on the Aous, drove him back to the pass of Tempe, and in the next year utterly routed him at Cynoscephalae. Almost at the same moment the Achaeans, who had now joined Rome, took Corinth, and the Rhodians defeated his troops in Caria. Further resistance was impossible; Philip submitted, and early the next year a Roman commission reached Greece with instructions to arrange terms of peace. These were such as effectually secured Rome's main object in the war, the removal of all danger to herself and her allies from Macedonian aggression. Philip was left in possession of his kingdom, but was degraded to the rank of a second-rate Power, deprived of all possessions in Greece, Thrace and Asia Minor, and forbidden, as Carthage had been in 201, to wage war without the consent of Rome, whose ally and friend he now became.

The second point in the settlement now effected by Rome was the liberation of the Greeks. The "freedom of Greece" was

¹E.g., Tarentum, Livy, xlv. 16. A Roman colony was established at Croton in 194, and a Latin colony (Copia) at Thurii in 193 (Livy, xxxiv. 45, 53).

proclaimed at the Isthmian games amid a scene of wild enthusiasm, which reached its height when two years later (194) Flamininus withdrew his troops even from the "three fetters of Greece"—Chalcis, Demetrias and Corinth. There is no reason to doubt that, in acting thus, not only Flamininus himself, but the senate and people at home were influenced, partly at any rate, by feelings of genuine sympathy with the Greeks and reverence for their past. It is equally clear that no other course was open to them. For Rome to have annexed Greece, as she had annexed Sicily and Spain, would have been a flagrant violation of the pledges she had repeatedly given both before and during the war; the attempt would have excited the fiercest opposition, and would probably have thrown the Asiatic as well as the European Greeks into the arms of Antiochus. But a friendly and independent Greece would be at once a check on Macedonia and a barrier against aggression from the East. Nor while liberating the Greeks did Rome abstain from such arrangements as seemed necessary to secure the predominance of her own influence. In the Peloponnese, for instance, the Achaeans were rewarded by considerable accessions of territory; and it is possible that the Greek states, as allies of Rome, were expected to refrain from war upon each other without her consent.

War with Antiochus, 192-189.—Antiochus III. of Syria, Philip's accomplice in the proposed partition of the dominions of their common rival, Egypt, returned from the conquest of Coele-Syria (198) to learn first of all that Philip was hard pressed by the Romans, and shortly afterwards that he had been decisively beaten at Cynoscephalae. It was already too late to assist his former ally, but Antiochus resolved at any rate to lose no time in securing for himself the possessions of the Ptolemies in Asia Minor and in eastern Thrace, which Philip had claimed, and which Rome now pronounced free and independent. In 197-196 he overran Asia Minor and crossed into Thrace. But Antiochus was pleasure-loving, irresolute, and no general, and it was not until 192 that the urgent entreaties of the Aetolians, and the withdrawal of the Roman troops from Greece, nerved him to the decisive step of crossing the Aegean; even then the force he took with him was so small as to show that he completely failed to appreciate the nature of the task before him. At Rome the prospect of a conflict with Antiochus excited great anxiety, and it was not until every resource of diplomacy had been exhausted that war was declared, and the real weakness which lay behind the once magnificent pretensions of the "king of kings" was revealed.

Had Antiochus acted with energy when in 192 he landed in Greece, he might have won the day before the Roman legions appeared. As it was, in spite of the warnings of Hannibal, who was now in his camp, and of the Aetolians, he frittered away valuable time between his pleasures at Chalcis and useless attacks on petty Thessalian towns. In 191 Acilius Glabrio landed at the head of an imposing force; and a single battle at Thermopylae broke the courage of Antiochus, who hastily recrossed the sea to Ephesus, leaving his Aetolian allies to their fate. But Rome could not pause here. The safety of her faithful allies, the Pergamenes and Rhodians, and of the Greek cities in Asia Minor, as well as the necessity of chastising Antiochus, demanded an invasion of Asia. A Roman fleet had already (191) crossed the Aegean, and in concert with the fleets of Pergamum and Rhodes worsted the navy of Antiochus. In 190 the new consul L. Scipio, accompanied by his famous brother, the conqueror of Africa, led the Roman legion for the first time into Asia. At Magnesia ad Sipylum, in Lydia, he met and defeated the motley and ill-disciplined hosts of the great king. For the first time the West, under Roman leadership, successfully encountered the forces of the East, and the struggle began which lasted far on into the days of the emperors. The terms of the peace which followed the victory at Magnesia tell their own story clearly enough. There is no question, any more than in Greece, of annexation; the main object in view is that of securing the predominance of Roman interests and influence throughout the peninsula of Asia Minor, and removing to a safe distance the only eastern Power which could be considered dangerous. The line of the Halys and the Taurus range, the natural boundary of the peninsula eastwards, was estab-

lished as the boundary between Antiochus and the kingdoms, cities and peoples now enrolled as the allies and friends of Rome. This line Antiochus was forbidden to cross; nor was he to send ships of war farther west than Cape Sarpedon in Cilicia. Immediately to the west of this frontier lay Bithynia, Paphlagonia and the immigrant Celtic Galatae, and these frontier states, now the allies of Rome, served as a second line of defence against attacks from the east. The area lying between these "buffer states" and the Aegean was organized by Rome in such a way as should at once reward the fidelity of her allies and secure both her own paramount authority and safety from foreign attack. Pergamum and Rhodes were so strengthened—the former by the gift of the Chersonese, Lycania, Phrygia, Mysia and Lydia, the latter by that of Lycia and Caria—as not only amply to reward their loyalty, but to constitute them effective props of Roman interests and effective barriers alike against Thracian and Celtic raids in the north and the Syrian aggression in the south. Lastly, the Greek cities on the coast, except those already tributary to Pergamum, were declared free, and established as independent allies of Rome.

In a space of little over 11 years (200-189) Rome had broken the power of Alexander's successors and established throughout the eastern Mediterranean a Roman protectorate.

Third Macedonian War, 171-168.—It was in the western half of this protectorate that the first steps in the direction of annexation were taken. The enthusiasm provoked by the liberation of the Greeks had died away, and its place had been taken by feelings of dissatisfied ambition or sullen resentment. Internecine feuds and economic distress had brought many parts of Greece to the verge of anarchy, and, above all, the very foundations of the settlement effected in 197 were threatened by the reviving power and aspirations of Macedonia. Loyally as Philip had aided Rome in the war with Antiochus, the peace of Magnesia brought him nothing but fresh humiliation. He was forced to abandon all hopes of recovering Thessaly, and he had the mortification to see the hated king of Pergamum installed almost on his borders as master of the Thracian Chersonese. Resistance at the time was unavailing, but from 189 until his death (179) he laboured patiently and quietly to increase the internal resources of his own kingdom, and to foment, by dexterous intrigue, feelings of hostility to Rome among his Greek and barbarian neighbours. His successor, Perseus, his son by a left-handed alliance, continued his father's work. He made friends among the Illyrian and Thracian princes, connected himself by marriage with Antiochus IV. of Syria and with Prusias of Bithynia, and, among the Greek peoples, strove, not without success, to revive the memories of the past glories of Greece under the Macedonian leadership of the Great Alexander. The senate could no longer hesitate. They were well aware of the restlessness and discontent in Greece; and after hearing from Eumenes of Pergamum and from their own officers, all details of Perseus's intrigues and preparations, they declared war. The struggle, in spite of Perseus's courage and the incapacity at the outset of the Roman commanders, was short and decisive. The sympathy of the Greeks with Perseus, which had been encouraged by the hitherto passive attitude assumed by Rome, instantly evaporated on the news that the Roman legions were on their way to Greece. No assistance came from Prusias or Antiochus, and Perseus's only allies were the Thracian king Cotys and the Illyrian Genthius. The victory gained by L. Aemilius Paulus at Pydna (168) ended the war. Perseus became the prisoner of Rome, and as such died in Italy a few years later. Rome had begun the war with the fixed resolution no longer of crippling but of destroying the Macedonian State. Perseus's repeated proposals for peace during the war had been rejected; and his defeat was followed by the final extinction of the kingdom of Philip and Alexander. Macedonia, though it ceased to exist as a single State, was not, however, definitely constituted a Roman province. On the contrary, the mistake was made of introducing some of the main principles of the provincial system—taxation, disarmament and the isolation of the separate communities—without the addition of the element most essential for the maintenance of order—that of a resident Roman governor. The four petty republics now created were each

autonomous, and each separated from the rest by the prohibition of *commercium* and *conubium*, but no central controlling authority was substituted for that of the Macedonian king. The inevitable result was confusion and disorder, resulting finally (149-48) in the attempt of a pretender, Andronicus, who claimed to be a son of Perseus, to resuscitate the ancient monarchy. On his defeat in 148 the senate declared Macedonia a Roman province, and placed a Roman magistrate at its head.

From 189 to the defeat of Perseus in 168 no formal change of importance in the status of the Greek states had been made by Rome. The senate, though forced year after year to listen to the mutual recriminations and complaints of rival communities and factions, contented itself as a rule with intervening just enough to remind the Greeks that their freedom was limited by its own paramount authority, and to prevent any single state or confederacy from raising itself too far above the level of general weakness which it was the interest of Rome to maintain. After the victory at Pydna, however, the sympathy shown for Perseus, exaggerated as it seems to have been by the interested representations of the romanizing factions in the various states, was made the pretext for a more emphatic assertion of Roman ascendancy. All those suspected of Macedonian leanings were removed to Italy, as hostages for the loyalty of their several communities, and the real motive for the step was made clear by the exceptionally severe treatment of the Achaeans, whose loyalty was not really doubtful, but whose growing power in the Peloponnese and independence of language had awakened alarm at Rome. A thousand of their leading men, among them the historian Polybius, were carried off to Italy (see *POLYBIUS*). In Aetolia the Romans connived at the massacre by their so-called friends of 500 of the opposite party. Acarnania was weakened by the loss of Leucas, while Athens was rewarded for her unambitious loyalty by the gift of Delos and Samos.

But this somewhat violent experiment only answered for a time. In 148 the Achaeans rashly persisted, in spite of warnings, in attempting to compel Sparta by force of arms to submit to the league. When threatened by Rome with the loss of all that they had gained since Cynoscephalae, they madly rushed into war. They were easily defeated, and a "commission of ten," under the presidency of L. Mummius, was appointed by the senate thoroughly to resettle the affairs of Greece. Corinth, by orders of the senate, was burnt to the ground and its territory confiscated. Thebes and Chalcis were destroyed, and the walls of all towns which had shared in the last desperate outbreak were razed to the ground. All the existing confederacies were dissolved; no *commercium* was allowed between one community and another. Everywhere an aristocratic type of constitution was established, and the payment of a tribute was apparently imposed. Into Greece, as into Macedonia in 167, the now familiar features of the provincial system were introduced—disarmament, isolation and taxation. The Greeks were still nominally free, and no separate province with a governor of its own was established, but the needed central control was provided by assigning to the neighbouring governor of Macedonia a general supervision over the affairs of Greece. From the Adriatic to the Aegean, and as far north as the river Drilo and Mt. Scardus, the whole peninsula was now under direct Roman rule.

The Roman Protectorate in Asia.—Beyond the Aegean the Roman protectorate worked no better than in Macedonia and Greece, and the quarrels and disorders which flourished under its shadow were aggravated by its longer duration and by the still more selfish view taken by Rome of her responsibilities. At one period indeed, after the battle of Pydna, it seemed as if the more vigorous, if harsh, system then initiated in Macedonia and Greece was to be adopted farther east also. The levelling policy pursued towards Macedonia and the Achaeans was applied with less justice to Rome's two faithful and favoured allies, Rhodes and Pergamum. The former had rendered themselves obnoxious to Rome by their independent tone. On a charge of complicity with Perseus, they were threatened with war, and though this danger was averted they were forced to exchange their equal alliance with Rome for one which placed them in close dependence upon

her, and to resign the lucrative possessions in Lycia and Caria given them in 189. Finally, their commercial prosperity was ruined by the establishment of a free port at Delos. With Eumenes of Pergamum no other fault could be found than that he was strong and successful; but this was enough. His brother Attalus was invited, but in vain, to become his rival. His turbulent neighbours, the Galatae, were allowed to harass him by raids. Pamphylia was declared independent, and favours were heaped upon Prusias of Bithynia. These and other annoyances and humiliations had the desired effect. Eumenes and his two successors—his brother and son, Attalus II. and Attalus III.—contrived indeed by studious humility and dexterous flattery to retain their thrones, but Pergamum (*q.v.*) ceased to be a powerful State, and its weakness, added to that of Rhodes, increased the prevalent disorder in Asia Minor. During the same period we have other indications of a temporary activity on the part of Rome. The frontier of the protectorate was pushed forward to the confines of Armenia by alliances with the kings of Pontus and Cappadocia beyond the Halys. In Syria, on the death of Antiochus Epiphanes (164), Rome intervened to place a minor, Antiochus Eupator, on the throne, under Roman guardianship. In 168 Egypt formally acknowledged the suzerainty of Rome, and in 163 the senate, in the exercise of this new authority, restored Ptolemy Philometor to his throne, but at the same time weakened his position by handing over Cyrene and Cyprus to his brother Euergetes.

But this display of energy was short-lived. From the death of Eumenes in 159 down to 133 Rome, secure in the absence of any formidable power in the East, and busy with affairs in Macedonia, Africa and Spain, relapsed into an inactivity the disastrous results of which revealed themselves in the next period, in the rise of Mithridates of Pontus, the spread of Cretan and Cilician piracy, and the advance of Parthia.

Both the western and eastern Mediterranean now acknowledged the suzerainty of Rome, but her relations with the two were from the first different. The West fell to her as the prize of victory over Carthage, and, the Carthaginian power broken, there was no hindrance to the immediate establishment in Sicily, Sardinia, Spain, and finally in Africa, of direct Roman rule. To the majority, moreover, of her western subjects she brought a civilization as well as a government of a higher type than any before known to them. And so in the West she not only formed provinces but created a new and wider Roman world. To the East, on the contrary, she came as the liberator of the Greeks; and it was only slowly that in this part of the empire her provincial system made way. In the East, moreover, the older civilization she found there obstinately held its ground. Her proconsuls governed and her legions protected the Greek communities, but to the last the East remained in language, manners and thought Greek and not Roman.

(c) **The Period of the Revolution (146-49 B.C.).**—In the course of little more than a century, Rome had become the supreme power in the civilized world. Although in its outward form her old constitution had undergone little change during the age of war and conquest from 265 to 146, the causes, both internal and external, which brought about its fall had been silently at work throughout. Its form was in strictness that of a moderate democracy. The patriciate had ceased to exist as a privileged caste, and there was no longer any order of nobility recognized by the constitution. The senate and the offices of state were in law open to all, and the will of the people in assembly had been in the most explicit and unequal manner declared to be supreme alike in the election of magistrates, in the passing of laws, and in all matters touching the *caput* of a Roman citizen. But in practice the constitution had become an oligarchy. The senate, not the assembly, ruled Rome, and both the senate and the magistracies were in the hands of a class which, in defiance of the law, arrogated to itself the title and the privileges of a nobility. The ascendancy of the senate is too obvious and familiar a fact to need much illustration here. It was but rarely that the assembly was called upon to decide questions of policy, and then the proposal was usually made by the magistrate in obedience to the

express directions of the senate. In the enormous majority of cases the matter was settled by a *senatus consultum*, without any reference to the people at all. The assembly decided for war or peace, but the conduct of the war and the conditions of peace are matters left to the senate (*q.v.*). Now and then the assembly confers a command upon the man of its choice, or prolongs the *imperium* of a magistrate, but, as a rule, these and all questions connected with foreign affairs are settled within the walls of the senate-house. It is the senate which year after year assigns the commands and fixes the number and disposition of the military forces, directs the organization of a new province, conducts negotiations and forms alliances. Within Italy, though its control of affairs was less exclusive, we find that, besides supervising the ordinary current business of administration, the senate decides questions connected with the Italian allies, sends out colonies, allots lands, and directs the suppression of disorders. Lastly, both in Italy and abroad it managed the finances. Inseparably connected with this monopoly of affairs to the exclusion of the assembly was the control which in practice, if not in theory, the senate exercised over the magistrates. The latter had become what Cicero wrongly declares they were always meant to be, merely the subordinate ministers of the supreme council, which assigned them their departments, provided them with the necessary equipment, claimed to direct their conduct, prolonged their commands, and rewarded them with triumphs. It was now at once the duty and the interest of a magistrate to be in *auctoritate senatus*, "subject to the authority of the senate," and even the once formidable *tribuni plebis* are found during this period actively and loyally supporting the senate, and acting as its spokesmen in the assembly.

The Senatorial Government.—Behind both senate and magistrates, lay the whole power and influence of the new nobility. These nobles were essentially distinct from the older and more legitimate patrician aristocracy. Every patrician was of course noble, but the majority of the "noble families" in 146 were not patrician but plebeian. The title had been gradually appropriated, since the opening of the magistracies, by those families whose members had held the consulship. It was thus in theory within the reach of any citizen who could win this office, and, moreover, it carried with it no legal privileges whatsoever. Gradually, however, the ennobled plebeian families drew together, and combined with the older patrician *gentes* to form a distinct order. Office brought wealth and prestige, and both wealth and prestige were liberally employed in securing for this select circle a monopoly of political power, and excluding new men. Already by the close of the period it was rare for anyone but a noble to find his way into high office or into the senate. The senate and magistrates were the mouthpieces of this order, and identified with it in policy and interest. Lastly, it must be allowed that both the senate and the nobility had to some extent justified their power by the use they made of it. It was their tenacity of purpose and devoted patriotism which had carried Rome through the dark days of the Hannibalic War. The heroes of the struggle with Carthage belonged to the leading families; the disasters at the Trasimene lake and at Cannae were associated with the blunders of popular favourites.

From the first, however, there was an inherent weakness in this senatorial government. It had no sound constitutional basis, and with the removal of its accidental supports it fell to the ground. Legally the senate had no positive authority. It could merely advise the magistrate when asked to do so, and its decrees were strictly only suggestions to the magistrate, which he was at liberty to accept or reject as he chose. It had, it is true, become customary for the magistrate not only to ask the senate's advice on all important points, but to follow it when given. But it was obvious that if this custom were weakened, and the magistrates chose to act independently, the senate was powerless. It might indeed anathematize the refractory official, or hamper him if it could by setting in motion against him a colleague or the tribunes, but it could do no more, and these measures failed just where the senate's control was most needed and most difficult to maintain—in its relations with the generals and governors of provinces abroad. The virtual independence of the proconsul

was before 146 already exciting the jealousy of the senate and endangering its supremacy. Nor again had the senate any legal hold over the assembly. Except in certain specified cases, it rested with the magistrate to decide whether any question should be settled by a decree of the senate or a vote of the assembly. If he decided to make a proposal to the assembly, he was not bound except by custom to obtain the previous approval of the senate, and the constitution set no limits to the power of the assembly to decide any question whatsoever that was laid before it.

From 150, at least, onwards, there were increasing indications that both the acquiescence of the people in senatorial government and the loyalty of the magistrates to the senate were failing. The rich landowners were not only taking possession of the public lands but were buying out the small farmers. And since the Government took little interest in commerce and industry, the poor were drifting idly to the cities or migrating to the Po valley. Slaves were being brought in to do the work of citizens, and the levies for the wars, which never ceased, fell more and more upon a decreasing citizenry. Between 165 and 155 the number of citizens, which should have increased by at least 100,000, actually dropped 20,000. The populace began to object to the constant levies and to criticize the régime which seemed only to be interested in foreign policies.

It is possible that these constitutional and administrative difficulties would not have proved so rapidly fatal to the republic had not its very foundations been sapped by the changes which followed more or less directly on the conquests of the 3rd and 2nd centuries B.C. For the opening of the world to Rome, and of Rome to the world, produced a radical change in the structure of Roman society. The subjugation of the Mediterranean countries, by placing at the disposal of Rome the vast natural resources of the West and the accumulated treasures of the East, caused a rapid rise in the standard of wealth and a marked change in its distribution. The Roman State was enabled to dispense with the direct taxation of its citizens, since it derived all the revenue which it needed from the subject countries. But this wealth enticed the Romans away from a beneficial development of their own resources into a dangerous parasitism. In time generations and soldiers learned to depend upon the profits of wars, governors to provide for their estates out of illegitimate perquisites of office far away from the vigilant eyes of magistrates at home. Speculators learned to place mortgages in the provinces where interest rates were high, to profit by the protection of Rome's armies, and secure the high return of their investments from lenient governors. Roman nobles, engaged all their lives in the expensive civil and military service, unable to devote any attention to developing their own properties for a livelihood, excused their own and their fellows' exploitation of the subjects. Compelled to find leisure from financial concerns, they disregarded the needs of industry and commerce that might have employed citizens and developed the resources of Italy. Instead they acquiesced in the slave-driven culture of large estates which yielded meagre returns and begot out of war captives a body of citizens bred in servility, ignorance and hatred. Surely the great successes of the 2nd century had come too speedily.

The New Learning.—It was not only the structure and composition of Roman society that underwent a transformation. The victory of Rome in her struggle for supremacy in the Mediterranean basin had been largely due to the powerful conservative forces by which her institutions were preserved from decay. Respect for the *mos maiorum*, or ancestral custom, imposed an effective check on the desire for innovation. Though personal religion, in the deeper sense, was foreign to the Roman temperament, there was a genuine belief in the gods whose favour had made Rome great in the past and would uphold her in the future so long as she trod in the old paths of loyalty and devotion. Above all, the healthy moral traditions of early Rome were maintained by the discipline of the family, resting on the supreme authority of the father—the *patria potestas*—and the powerful influence of the mother, to whom the early training of the child was entrusted. Finally, the institution of the censorship, backed as it was by the mighty force of public opinion, provided a deterrent

which prevented any flagrant deviation from the accepted standard of morals. All this was changed by the influence of Greek civilization, with which Rome was first brought face to face in the 3rd century B.C. owing to her relations with Magna Graecia. At first the results of contact with the older and more brilliant culture of Hellas were on the whole good. In the 2nd century B.C., when constant intercourse was established with the communities of Greece proper and of Asia Minor, "philhellenism" became a passion, which was strongest in the best minds of the day and resulted in a quickened intellectual activity, wider sympathies and a more humane life. But at the same time the "new learning" was a disturbing and unsettling force. The Roman citizen was confronted with new doctrines in politics and religion, and initiated into the speculations of critical philosophy. Under the influence of this powerful solvent the fabric of tradition embodied in the *mos maiorum* fell to pieces; a revolt set in against Roman discipline and Roman traditions of self-effacement, and the craving for individual distinction asserted itself with irresistible vehemence. As it had been in the days of the "sophistic" movement at Athens, so it was now with Rome; a higher education, which, owing to its expense, was necessarily confined to the wealthier classes, interposed between the upper and lower ranks of society a barrier even more effectual than that set up by differences of material condition, and by releasing the individual from the trammels of traditional morality, gave his ambition free course. The effect on private morals may be gauged by the vehemence with which the reactionary opposition, headed by M. Porcius Cato (consul, 195 B.C.; censor, 184 B.C.), inveighed against the new fashions, and by the list of measures passed to check the growth of luxury and licence, and to exclude the foreign teachers of the new learning. It was all in vain. The art of rhetoric, which was studied through the medium of Greek treatises and Greek models, furnished the Roman noble with weapons of attack and defence of which he was not slow to avail himself in the forum and the senate-house. In the science of money-making which had been elaborated under the Hellenistic monarchies, the Roman capitalists proved apt pupils of their Greek teachers. Among the lower classes, contact with foreign slaves and freedmen, with foreign worshipers and foreign wives, produced a love of novelty which no legislation could check. Even amongst women there were symptoms of revolt against the old order, which showed itself in a growing freedom of manners and impatience of control, the marriage tie was relaxed, and the respect for mother and wife which had been so powerful a factor in the maintenance of the Roman standard of morals, was grievously diminished. Thus Rome was at length brought face to face with a moral and economic crisis which a modern historian has described in the words: "Italy was living through the fever of moral disintegration and incoherence which assails all civilized societies that are rich in the manifold resources of culture and enjoyment, but tolerate few or no restraints on the feverish struggle of contending appetites." In this struggle the Roman republic perished, and personal government took its place. The world had outgrown the city-state and its political machinery, and as representative government, tried in Thessaly and Macedonia, was out of the question in a heterogeneous empire, no solution of the problem was possible save that of absolutism. But a far stronger resistance would have been opposed to political revolution by the republican system had not public morals been sapped by the influences above described. Political corruption was reduced to a science for the benefit of individuals who were often faced with the alternatives of ruin or revolution; there was no longer any body of sound public opinion to which, in the last resort, appeal could be made; and, long before the final catastrophe took place, Roman society itself had become, in structure and temper, thoroughly unrepblican.

The Gracchi, 133-121.—The first systematic attack upon the senatorial government is connected with the names of Tiberius and Gaius Gracchus (*qq.v.*) and its immediate occasion was an attempt to deal with no less a danger than the threatened disappearance of the class to which of all others Rome owed most in the past. The small landholders throughout the greater part of Italy were sinking deeper into ruin under the pressure of accum-

ulated difficulties. The Hannibalic war had laid waste their fields and thinned their numbers, nor when peace returned to Italy did it bring with it any revival of prosperity. The heavy burden of military service still pressed ruinously upon them, and in addition they were called upon to compete with the foreign corn imported from beyond the sea, and with the foreign slave-labour purchased by the capital of wealthier men. Farming became unprofitable, and the hard laborious life with its scanty returns was thrown into still darker relief when compared with the stirring life of the camps with its opportunities of booty, or with the cheap provisions, frequent largesses and gay spectacles to be had in the large towns. The small-holders went off to follow the eagles to try fortune in some province, or swell the proletariat of the cities, and their holdings were left to run waste or merged in the vineyards, olive-yards and above all in the great cattle farms of the rich, and their own place was taken by slaves. The evil was worst in Etruria and in southern Italy; but everywhere it was serious enough to demand the earnest attention of Roman statesmen. Of its existence the Government had received plenty of warning in the declining numbers of able-bodied males returned at the census, in the increasing difficulties of recruiting for the legions, in servile outbreaks in Etruria and Apulia, and between 200 and 160 a good deal was attempted by way of remedy. In addition to the foundation of 20 colonies, there were frequent allotments of land to veteran soldiers, especially in Apulia and Samnium. In 180, 40,000 Ligurians were removed from their homes and settled on vacant lands once the property of a Samnite tribe, and in 160 the Pomptine marshes were drained for the purpose of cultivation. But these efforts were only partially successful. The colonies planted in Cisalpine Gaul and in Picenum flourished, but of the others the majority slowly dwindled away, and two required recolonizing only eight years after their foundation. The veterans who received land were unfitted to make good farmers; and large numbers, on the first opportunity, gladly returned as volunteers to a soldier's life. Moreover, after 160 even these efforts ceased, and with the single exception of the colony of Auximum in Picenum (157) nothing was done to check the spread of the evil, until in 133 Tiberius Gracchus, on his election to the tribunate, set his hand to the work.

The remedy proposed by Gracchus amounted in effect to the resumption by the State of as much of the "common land" as was not held in occupation by authorized persons and conformably to the provisions of the Licinian law, and the distribution in allotments of the land thus rescued for the community from the monopoly of a few. It was a scheme which could quote in its favour ancient precedent as well as urgent necessity. Of the causes which led to its ultimate failure something will be said later on; for the present we must turn to the constitutional conflict which it provoked. The senate from the first identified itself with the interests of the wealthy occupiers, and Tiberius found himself forced into a struggle with that body, which had been no part of his original plan. He fell back on the legislative sovereignty of the assembly; he resuscitated the half-forgotten powers of interference vested in the tribunate in order to paralyse the action of the senatorial magistrates, and finally lost his life in an attempt to make good one of the weak points in the tribune's position by securing his own re-election for a second year. But the conflict did not end with his death. It was renewed on a wider scale and with a more deliberate aim by his brother Gaius, who on his election to the tribunate (123) at once came forward with a vast programme of legislation. He shrewdly began by weakening the influence of the senate. Since his followers had every reason to dread the *senatus consultum ultimum*, the senate's chief weapon of attack against opponents, his first plebiscite reasserted the "right of appeal." He then destroyed the senate's prerogative to assign the provinces to its partisans, took away the jury panels from the senators, and also claimed for the assembly the right to assign public contracts and to control the budget so far as it desired. Thus the senate lost control of the gifts by which it cajoled and the lashes by which it compelled obedience. Very early also he gave doles of grain to the poor. This later led to great evils, but it must have been instituted as a temporary

measure since he intended soon to distribute the needy in colonies. The evils of the dole must be accredited to the senate which stopped the colonization and did not have the courage to stop the dole. The jury panels he now made up of knights instead of senators. Gracchus wished, it seems, to give official recognition through civil service to men of business, in whom he had great faith. He would thus widen the group interested in public concerns and build up an influential order as a balance to the old nobility. Later it proved a disadvantage that publicans could sit in judgment over provincial governors who had to hold the publicans in check, but this difficulty could hardly have been foreseen since publicans did not yet have provincial contracts. In order to secure larger returns from the Asiatic province recently inherited by Rome, Gracchus permitted the knights to form corporations of limited liability (such corporations were otherwise prohibited) with the privilege of taking contracts to gather and dispose of the Asiatic tithe. The advantages would be that the State would receive in advance the sums bid, would not have to build up a large taxing bureau in order to get all that was due, and the taxpayers could pay the tithe in kind according to the yield of each year. Since this system had not been tried before by Rome, its inherent evils were probably not yet known. In time it led not only to harsh exactions because of collusion between governors and publicans, but also to costly exploitation, because the publicans lent money to delinquents at high rates and engaged generally in unseemly speculation. Gracchus used the money in such public works as the assembly at his bidding authorized. The colonies which Gracchus founded—it was only the beginning of a large project—were well selected. Two were planted in southern Italy where many allotments had recently been made to small farmers—at Tarentum and Scylacium. For these, men specially selected for their capacity were chosen. Then 6,000 hardy farmers were sent to the province of Africa which had been lying desolate for a generation, and which had had to depend upon the Punic city of Utica for its harbour and its praetorian residence. Not even then did the senate comprehend its duty to its provincials, but cancelled the colonial charter, though it dared not cancel the allotments. And now though Gracchus lost his re-election to the tribunate he attempted his last great reform of giving the franchise to the Latins in order that the democracy might rest on a wider and sounder basis. Since Caesar, who took many suggestions from Gracchus, later proposed to extend balloting through Italy by local polls, it is not unlikely that Gracchus had that in view. That would finally have removed democratic legislation from the control of the urban crowd. Be that as it may, the attempt to broaden the franchise failed, not this time because of senatorial opposition but because of the selfishness of the voters who did not wish to diminish their own prerogatives. Gracchus lost his influence, and soon after when a riot arose the senate declared martial law and summoned Gracchus to the bar of the senate. He refused to recognize a procedure which the assembly had outlawed the year before. The senate insisting on the legality of its course ordered his arrest and in the riot which ensued he was slain.

The agrarian reforms of the two Gracchi had little permanent effect. Even in the lifetime of Gaius the clause in his brother's law rendering the new holdings inalienable was repealed, and the process of absorption recommenced. In 118 a stop was put to further allotment of occupied lands, and finally, in 111, the whole position of the agrarian question was altered by a law which converted all land still held in occupation into private land. The old controversy as to the proper use of the lands of the community was closed by this act of alienation. The controversy in future turns, not on the right of the poor citizens to the State lands, but on the expediency of purchasing other lands for distribution at the cost of the treasury.

But, though the agrarian reform failed, the political conflict it had provoked continued, and the lines on which it was waged were in the main those laid down by Gaius Gracchus. The sovereignty of the assembly continued to be the watchword of the popular party, and a free use of the tribunician powers of interference and of legislation remained the most effective means of accomplish-

ing their aims.

Marius, 118-100.—Ten years after the death of Gaius the *populares* once more summoned up courage to challenge the supremacy of the senate; but it was on a question of foreign administration that the conflict was renewed. The course of affairs in the client state of Numidia since Micipsa's death in 118 had been such as to discredit a stronger government than that of the senate. In defiance of Roman authority, and relying on the influence of his own well-spent gold, Jugurtha had murdered both his legitimate rivals, Hiempsal and Adherbal, and made himself master of Numidia. The declaration of war wrung from the senate (112) by popular indignation had been followed by the corruption of a consul (111) and the crushing defeat of the proconsul Albinus. On the news of this crowning disgrace the storm burst, and on the proposal of the tribunes a commission of enquiry into the conduct of the war was appointed. But the popular leaders did not stop here. Q. Caecilius Metellus, who as consul (109) had succeeded to the command in Numidia, was an able soldier but a rigid aristocrat; and they now resolved to improve their success by entrusting the command instead to a genuine son of the people. Their choice fell on Gaius Marius (*see* **MARIUS**), an experienced officer and administrator, but a man of humble birth, wholly illiterate, and one who, though no politician, was by temperament and training a hater of the polished and effeminate nobles who filled the senate. He was triumphantly elected, and, in spite of a decree of the senate continuing Metellus as proconsul, he was entrusted by a vote of the assembly with the charge of the war against Jugurtha (*q.v.*)

Jugurtha was vanquished; and Marius, who had been a second time elected consul in his absence, arrived at Rome in Jan. 104, bringing the captive prince with him in chains. But further triumphs awaited the popular hero. The Cimbri and Teutones were at the gates of Italy; they had four times defeated the senatorial generals, and Marius was called upon to save Rome from a second invasion of the barbarians. After two years of suspense the victory at Aquae Sextiae (102), followed by that on the Raudine plain (101), put an end to the danger by the annihilation of the invading hordes; and Marius, now consul for the fifth time, returned to Rome in triumph. There the popular party welcomed him as a leader with all the prestige of a successful general. Once more, however, they were destined to a brief success followed by disastrous defeat. Marius became for the sixth time consul; of the two popular leaders Glauca became praetor and Saturninus tribune. But Marius and his allies were not statesmen of the stamp of the Gracchi; and the laws proposed by Saturninus had evidently no serious aim in view other than that of harassing the senate. His corn law merely reduced the price fixed in 123 for the monthly dole of corn, and the main point of his agrarian law lay in the clause appended to it requiring all senators to swear to observe its provisions¹. The laws were carried, but the triumph of the popular leaders was short-lived. Their period of office was drawing to a close. At the elections fresh rioting took place, and Marius as consul was called upon by the senate to protect the State against his own partisans. Saturninus and Glauca surrendered, but while the senate was discussing their fate they were surrounded and murdered by their opponents.

The popular party had been worsted once more in their struggle with the senate, but none the less their alliance with Marius, and the position in which their votes placed him, marked an epoch in the history of the revolution. The transference of the political leadership to a consul who was nothing if not a soldier was at once a confession of the insufficiency of the purely civil authority of the tribunate and a dangerous encouragement of military interference in political controversies. The consequences were already foreshadowed by the special provisions made by Saturninus for Marius's veterans, and in the active part taken by them in the passing of his laws. Indirectly, too, Marius, though no politician, played an important part in this new departure. His military reforms at once democratized the army and attached it more closely to its leader for the time being. He swept away

¹For the *leges Appuleias*, *see* **SATURNINUS**, **LUCIUS APPULEIUS**, and authorities there quoted.

the last traces of civil distinctions of rank or wealth within the legion, admitted to its ranks all classes, and substituted voluntary enlistment under a popular general for the old-fashioned compulsory levy. The efficiency of the legion was increased at the cost of a complete severance of the ties which bound it to the civil community and to the civil authorities.

The Social War.—The next important crisis was due partly to the rivalry which had been growing more bitter each year between the senate and the commercial class, and partly to the long-pending question of the enfranchisement of the Italian allies. The *publicani*, *negotiatores* and others, who constituted what was now becoming known as the equestrian order (see *EQUITES*), had made unscrupulous use of their control of the courts and especially of the *questio de repetundis* against their natural rivals, the official class in the provinces. The threat of prosecution before a hostile jury was held over the head of every governor, legate and quaestor who ventured to interfere with their operations in the provinces. The average official preferred to connive at their exactions; the bolder ones paid with fines and even exile for their courage. In 92 the necessity for a reform was proved beyond a doubt by the scandalous condemnation of P. Rutilius Rufus, ostensibly on a charge of extortion, in reality as the reward of his efforts to check the extortions of the Roman equites in Asia. The difficulties of the Italian question were more serious. That the Italian allies were discontented was notorious. After nearly two centuries of close alliance, of common dangers and victories, they now eagerly coveted as a boon that complete amalgamation with Rome which they had at first resented as a dishonour. But, unfortunately, Rome had grown more exclusive in proportion as the value set upon Roman citizenship increased. During the last 40 years feelings of hope and disappointment had rapidly succeeded each other; Marcus Fulvius Flaccus, Gaius Gracchus, Saturninus, had all held out promises of relief—and nothing had yet been done. On each occasion they had crowded to Rome, full of eager expectation, only to be harshly ejected from the city by the consul's orders. The justice of their claims could hardly be denied, the danger of continuing to ignore them was obvious—yet the difficulties in the way of granting them were formidable in the extreme, and from a higher than a merely selfish point of view there was much to be said against the revolution involved in so sudden and enormous an enlargement of the citizen body.

Marcus Livius Drusus (g.v.), who as tribune gallantly took up the task of reform, is claimed by Cicero as a member of that party of the centre to which he belonged himself. Noble, wealthy and popular, he seems to have hoped to be able by the weight of his position and character to rescue the burning questions of the day from the grasp of extreme partisans and to settle them peacefully and equitably. But he, like Cicero after him, had to find to his cost that there was no room in the fierce strife of Roman politics for moderate counsels. His proposal to reform the law courts excited the equestrian order and their friends in the senate to fury. The agrarian and corn laws which he coupled with it alienated many more in the senate, and roused the old anti-popular party feeling; finally, his known negotiations with the Italians were eagerly misrepresented to the jealous and excited people as evidence of complicity with a widespread conspiracy against Rome. His laws were carried, but the senate pronounced them null and void. Drusus was denounced in the senate house as a traitor, and on his way home was struck down by the hand of an unknown assassin. His assassination was the signal for an outbreak which had been secretly prepared for some time before. Throughout the highlands of central and southern Italy the flower of the Italian people rose as one man. Etruria and Umbria held aloof; the isolated Latin colonies stood firm; but the Sabellian clans, north and south, the Latinized Marsi and Paeligni, as well as the Oscan-speaking Samnites and Lucanians, rushed to arms. No time was lost in proclaiming their plans for the future. A new Italian State was to be formed. The Paelignian town of Corfinum was selected as its capital and re-christened with the proud name of Italia. All Italians were to be citizens of this new metropolis, and here were to be the place of assembly and

the senate house. A senate of 500 members and a magistracy resembling that of Rome completed a constitution which adhered closely to the very political traditions which its authors had most reason to abjure.

Now, as always in the face of serious danger, the action of Rome was prompt and resolute. Both consuls took the field; with each were five legates, among them the veteran Marius and his destined rival L. Cornelius Sulla, and even freedmen were pressed into service with the legions. But the first year's campaign opened disastrously. In central Italy the northern Sabellians, and in the south the Samnites, defeated the forces opposed to them. And though before the end of the year Marius and Sulla in the north, and the consul Caesar himself in Campania, succeeded in inflicting severe blows on the enemy, and on the Marsi especially, it is not surprising that, with an empty treasury, with the insurgents' strength still unbroken, and with rumours of disaffection in the loyal districts, opinion in Rome should have turned in the direction of the more liberal policy which had been so often scornfully rejected and in favour of some compromise which should check the spread of the revolt, and possibly sow discord among their enemies. Towards the close of the year 90 the consul L. Julius Caesar (killed by Fimbria in 87) carried the *lex Julia*, by which the Roman franchise was offered to all communities which had not as yet revolted; early in the next year (89) the Julian law was supplemented by the *lex Plautia Papiria*, introduced by two of the tribunes, M. Plautius Silvanus and C. Papirius Carbo Arvina, which enacted that any citizen of an allied community then domiciled in Italy might obtain the franchise by giving in his name to a praetor in Rome within 60 days. A third law (*lex Calpurnia*), apparently passed at the same time, empowered Roman magistrates in the field to bestow the franchise there and then upon all who were willing to receive it. This sudden opening of the closed gates of Roman citizenship was completely successful, and its effects were at once visible in the diminished vigour of the insurgents. By the end of 89 the Samnites and Lucanians were left alone in their obstinate hostility to Rome, and neither, thanks to Sulla's brilliant campaign in Samnium, had for the moment any strength left for active aggression.

The termination of the Social War brought with it no peace in Rome. The old quarrels were renewed with increased bitterness, and the newly enfranchised Italians themselves complained as bitterly of the restriction which robbed them of their due share of political influence by allowing them to vote only in a specified number of tribes. The senate itself was distracted by violent personal rivalries—and all these feuds, animosities and grievances were aggravated by the widespread economic distress and ruin which affected all classes. Lastly, war with Mithridates VI. had been declared; it was notorious that the privilege of commanding the force to be sent against him would be keenly contested, and that the contest would lie between the veteran Marius and L. Cornelius Sulla.

Sulla.—It was in an atmosphere charged with the elements of disturbance that P. Sulpicius Rufus as tribune brought forward his laws. (See *SULPICIVS RUFUS*, *PUBLIUS*.) He proposed: (1) that the command of the Mithridatic War should be given to Marius, though it had legally been assigned to the consul Sulla; (2) that the new citizens should be distributed through all the tribes; (3) that the freedmen should no longer be confined to the four city tribes; (4) that any senator voting more than 2,000 denarii should lose his seat; (5) that those exiled on suspicion of complicity with the Italian revolt should be recalled. These proposals provoked a storm, and both sides were ready for violent measures. The consuls, in order to prevent legislation, proclaimed a public holiday. Sulpicius armed his followers and drove the consuls from the forum. The proclamation was withdrawn and the laws carried, but Sulpicius's triumph was short-lived. From Nola in Campania, where lay the legions commanded by him in the Social War, Sulla advanced on Rome, and for the first time a Roman consul entered the city at the head of the legions of the republic. Resistance was hopeless. Marius and Sulpicius fled, and Sulla, summoning the assembly of the centuries, proposed the measures he considered necessary for the

public security, the most important being a provision that the sanction of the senate should be necessary before any proposal was introduced to the assembly. Then, after waiting in Rome long enough to hold the consular elections, he left for Asia early in 87.

Sulla had conquered, but his victory cost the republic dear. He had first taught political partisans to look for final success, not to a majority of votes in the forum or campus, but to the swords of the soldiery. The lesson was well learnt. Shortly after his departure L. Cornelius Cinna as consul revived the proposals of Sulpicius; his colleague, Gnaeus Octavius, at the head of an armed force, fell upon the new citizens who had collected in crowds to vote, and the forum was heaped high with the bodies of the slain. Cinna fled, but fled, like Sulla, to the legions. When the senate declared him deposed from his consulship, he replied by invoking the aid of the soldiers in Campania in behalf of the violated rights of the people and the injured dignity of the consulship, and, like Sulla, found them ready to follow where he led. The neighbouring Italian communities, who had lost many citizens in the recent massacre, sent their new champion men and money; while from Africa, whither he had escaped after Sulla's entry into Rome, came Marius with 1,000 Numidian horsemen. The senate had prepared for a desperate defence, but fortune was adverse, and after a brief resistance they gave way. Cinna was acknowledged as consul, the sentence of outlawry passed on Marius was revoked and Cinna and Marius entered Rome with their troops. Marius's thirst for revenge was gratified by a frightful massacre, and he lived long enough to be nominated consul for the seventh time. But he held his consulship only a few weeks. Early in 86 he died, and for the next three years Cinna ruled Rome. Constitutional government was virtually suspended. For 85 and 84 Cinna nominated himself and a trusted colleague as consuls. The state was, as Cicero says, without lawful authority. A partial registration of the newly enfranchised Italians was made, but beyond this little was done. The attention of Cinna and his friends was in truth engrossed by the ever-present dread of Sulla's return from Asia. The consul of 86, L. Valerius Flaccus (who had been consul with Marius in 100 B.C.), sent out to supersede him, was murdered by his own soldiers at Nicomedia. In 85 Sulla, though disowned by his Government, concluded a peace with Mithridates. In 84, after settling affairs in Asia and crushing Flaccus's successor, C. Flavius Fimbria, he crossed into Greece, and in the spring of 83 landed at Brundisium with 40,000 soldiers and a large following of *émigré* nobles. Cinna was dead, murdered like Flaccus by his mutinous soldiers; his most trusted colleague, Cn. Papirius Carbo, was commanding as proconsul in Cisalpine Gaul; and the resistance offered to Sulla's advance was slight. At Capua, Sulla routed the forces of one consul, Gaius Norbanus; at Tenum the troops of the other went over in a body to the side of the outlawed proconsul. After a winter spent in Campania he pressed forward to Rome, defeated the younger Marius (consul, 82) near Praeneste, and entered the city without further opposition. In north Italy the success of his lieutenants, Q. Caecilius Metellus Pius (son of Metellus Numidicus), Cn. Pompeius and Marcus Crassus, had been fully as decisive. Cisalpine Gaul, Umbria and Etruria had all been won for Sulla, and the two principal leaders on the other side, Carbo and Norbanus, had each fled, one to Rhodes, the other to Africa. Only one foe remained to be conquered. The Samnites and Lucanians whom Cinna had conciliated, and who saw in Sulla their bitterest foe, were for the last time in arms, and had already joined forces with the remains of the Marian army close to Rome. The decisive battle was fought under the walls of the city, and ended in the complete defeat of the Marians and Italians (battle of the Colline Gate).

For a period of nearly ten years Rome and Italy had been distracted by civil war. Sulla (*q.v.*) was now called upon to heal the divisions which rent the State asunder, to set in working again the machinery of civil government, and above all to modify it as to meet the altered conditions, and to fortify it against the dangers which visibly threatened it in the future. The real charge against Sulla is not that he failed to accomplish all this, for to do so was beyond the powers even of a man so

able, resolute and self-confident as Sulla, armed though he was with absolute authority and backed by overwhelming military strength and the prestige of unbroken success. He stands concurring rather of deliberately aggravating some and culpably ignoring others of the evils he should have tried to cure, and of contenting himself with a party triumph when he should have aimed at the regeneration and confirmation of the whole State. His victory was instantly followed, not by any measures of conciliation, but by a series of massacres, proscriptions and confiscations, of which almost the least serious consequence was the immediate loss of life which they entailed. From this time forward the fear of proscription and confiscation recurred as a possible consequence of every political crisis, and it was with difficulty that Caesar himself disengaged the belief that his victory would be followed by aullan reign of terror. The legacy of hatred and discontent which Sulla left behind him was a constant source of disquiet and danger. In the children of the proscribed, whom he excluded from holding office, and the dispossessed owners of the confiscated lands, every agitator found ready and willing allies. The moneyed men of the equestrian order were more than ever hostile to the senatorial government, which they now identified with the man who cherished towards them a peculiar hatred, and whose creatures had hunted them down like dogs. The attachment which the new Italian citizens might in time have learnt to feel for the old republican constitution was nipped in the bud by the massacres at Praeneste and Norba, by the harsh treatment of the ancient towns of Etruria, and by the ruthless desolation of Samnium and Lucania. Quite as fatal were the results to the economic prosperity of the peninsula. Sulla's confiscations, following on the civil and social wars, opened the doors wide for a long train of evils. The veterans whom he planted on the lands he had seized did nothing for agriculture, and swelled the growing numbers of the turbulent and discontented. The "Sullan men" became as great an object of fear and dislike as the "Sullan reign." The *latifundia* increased with startling rapidity—whole territories passing into the hands of greedy partisans. Wide tracts of land, confiscated but never allotted, ran to waste. In many districts of Italy the free population finally and completely disappeared from the open country; and life and property were rendered insecure by the brigandage which now developed unchecked, and in which the herdsmen slaves played a prominent part. The outbreaks of Spartacus in 73, and of Catiline ten years later, were significant commentaries on this part of Sulla's work. His constitutional legislation, while it included many useful administrative reforms, is marked by as violent a spirit of partisanship, and as apparently wilful a blindness to the future. The re-establishment on a legal basis of the ascendancy which custom had so long accorded the senate was his main object. With this purpose he had already, when consul in 88, made the *senatus auctoritas* legally necessary for proposals to the assembly. He now as dictator followed this up by crippling the power of the magistracy, which had been the most effective weapon in the hands of the senate's opponents. The legislative freedom of the tribes was already hampered by the necessity of obtaining the senate's sanction; in addition, Sulla restricted their wide powers of interference (*intercessio*) to their original purpose of protecting individual plebeians, and discredited the office by prohibiting a tribune from holding any subsequent office in the State. The control of the courts (*quaestiones perpetuae*) was taken from the equestrian order and restored to the senate. To prevent the people from suddenly installing and keeping in high office a second Marius, he re-enacted the old law against re-election, and made legally binding the custom which required a man to mount up gradually to the consulship through the lower offices. His increase of the number of praetors from six to eight, and of quaestors to 20, though required by administrative necessities, tended, by enlarging the numbers and further dividing the authority of the magistrates, to render them still more dependent upon the central direction of the senate. Lastly, he replaced the pontifical and augural colleges in the hands of the senatorial nobles, by enacting that vacancies in them should, as before the *lex Domitia* (104), be filled up by co-optation. It cannot be said that Sulla was success-

ful in fortifying the republican system against the dangers which menaced it from without. He accepted as an accomplished fact the enfranchisement of the Italians, but he made no provision to guard against the consequent reduction of the *comitia* to an absurdity, and with them of the civic government which rested upon them, or to organize an effective administrative system for the Italian communities. In fact he prevented the further registration of the new citizens by abolishing the censorship. Of all men, too, Sulla had the best reason to appreciate the dangers to be feared from the growing independence of governors and generals in the provinces and from the transformation of the old civic militia into a group of professional armies, devoted only to a successful leader, and with the weakest possible sense of allegiance to the State. He had himself, as proconsul of Asia, contemptuously and successfully defied the home Government, and he, more than any other Roman general, had taught his soldiers to look only to their leader, and to think only of booty. Yet, beyond a few inadequate regulations, there is no evidence that Sulla dealt with these burning questions, the settlement of which was among the greatest of the achievements of Augustus. One administrative reform of real importance must, lastly, be set down to his credit. The judicial procedure first established in 149 for the trial of cases of magisterial extortion in the provinces, and applied between 149 and 81 to cases of treason and bribery. Sulla extended so as to bring under it the chief criminal offences, and thus laid the foundation of the Roman criminal law.

Overthrow of the Sullan Constitution.—The Sullan system stood for nearly nine years, and was then overthrown—as it had been established—by a successful soldier. It was the fortune of Cn. Pompey, a favourite officer of Sulla, first of all to violate in his own person the fundamental principles of the constitution re-established by his old chief, and then to overturn it. In Spain the Marian governor Q. Sertorius (*see* SERTORIUS, QUINTRUS) had defeated one after another of the proconsuls sent by the senate and was in 77 master of all Hither Spain. To meet the crisis, Pompey (*q.v.*), who was not yet 30 and had never held even the quaestorship, was sent out to Spain with proconsular authority. Sertorius held out, until in 73 he was foully murdered by his own officers. The native tribes who had loyally stood by him submitted, and Pompey early in 72 returned with his troops to Italy, where, during his absence in Spain, an event had occurred which had shown Roman society with startling plainness how near it stood to revolution. In 73 Spartacus (*q.v.*), a Thracian slave, escaped with 70 others from a gladiators' training school at Capua. In a startlingly short time he found himself at the head of 70,000 runaway slaves, outlaws, brigands and impoverished peasants, and for two years terrorized Italy, routed the legions sent against him, and even threatened Rome. He was at length defeated and slain by the praetor, M. Licinius Crassus, in Apulia. In Rome itself the various classes and parties hostile to the Sullan system had, ever since Sulla's death in 78, been incessantly agitating for the repeal of his most obnoxious laws, and needed only a leader in order successfully to attack a Government discredited by failure at home and abroad. With the return of Pompey from Spain their opportunity came. Pompey, who understood politics as little as Marius, was anxious to obtain a triumph, the consulship for the next year (70), and as the natural consequence of this an important command in the East. The opposition wanted his name and support, and a bargain was soon struck. Pompey and with him Marcus Licinius Crassus, the real conqueror of Spartacus, were elected consuls, almost in the presence of their troops, which lay encamped outside the gates in readiness to assist at the triumph and ovation granted to their respective leaders. Pompey lost no time in performing his part of the agreement. The tribunes regained their prerogatives. The "perpetual courts" (*quaestiones perpetuae*) were taken out of the hands of the senatorial *iudices*, who had outdone the equestrian order in scandalous corruption, and finally the censors, the first since 86 a.c., purged the senate of the more worthless and disreputable of Sulla's partisans. The victory was complete; but for the future its chief significance lay in the clearness with which it showed that the final decision in matters political lay with neither of

the two great parties in Rome, but with the holder of the military authority. The tribunes ceased to be political leaders and became lieutenants of the military commanders, and the change was fatal to the dignity of politics in the city. Men became conscious of the unreality of the old constitutional controversies, indifferent to the questions which agitated the forum and the curia, and contemptuously ready to alter or disregard the constitution itself when it stood in the way of interests nearer to their hearts.

Pompey, Caesar and Cicero.—When his consulship ended, Pompey impatiently awaited at the hands of the politicians he had befriended the further gift of a foreign command. He declined an ordinary province, and from the end of 70 to 67 he remained at Rome in a somewhat affectingly dignified seclusion. But in 67 and 66 the laws of Gabinus and Manilius gave him all and more than all that he expected (*see* POMPEY). By the former he obtained the sole command for three years against the Mediterranean pirates. He was to have supreme authority over all Roman magistrates in the provinces throughout the Mediterranean and over the coasts for 500 miles inland. Fifteen *legati*, all of praetorian rank, were assigned to him, with 200 ships, and as many troops as he thought desirable. The Manilian law transferred from Lucullus and Glabrio to Pompey the conduct of the Mithridatic War in Asia, and with it the entire control of Roman policy and interests in the East. The unrepudiated character of the position thus granted to Pompey, and the dangers of the precedent established, were clearly enough pointed out by such moderate men as Q. Lutatius Catulus, the "father of the senate," and by the orator Hortensius—but in vain. Both laws were supported, not only by the tribunes and the populace, but by the whole influence of the *publicani* and *negotiatores*, whose interests in the East were at stake.

Pompey left Rome in 67. In a marvellously short space of time he freed the Mediterranean from the Cilician pirates and established Roman authority in Cilicia itself. He then crushed Mithridates (*q.v.*), added Syria to the list of Roman provinces, and led the Roman legions to the Euphrates and the Caspian, leaving no power capable of disputing with Rome the sovereignty of western Asia. He did not return to Italy till towards the end of 62. The interval was marked in Rome by the rise to political importance of Caesar (*q.v.*) and Cicero, and by Catiline's attempt at revolution. As the nephew of Marius and the son-in-law of Cinna, Caesar possessed a strong hereditary claim to the leadership of the popular and Marian party. He had already taken part in the agitation for the restoration of the tribunate; he had supported the Manilian law; and, when Pompey's withdrawal left the field clear for other competitors, he stepped at once into the front rank on the popular side. He took upon himself, as their nearest representative, the task of clearing the memory and avenging the wrongs of the great popular leaders, Marius, Cinna and Saturninus. He publicly reminded the people of Marius's services, and set up again upon the Capitol the trophies of the Cimbric War. He endeavoured to bring to justice, not only the ringleaders in Sulla's bloody work of proscription, but even the murderers of Saturninus, and vehemently pleaded the cause of the children of the proscribed. While thus carrying on in genuine Roman fashion the feud of his family, he attracted the sympathies of the Italians by his efforts to procure the Roman franchise for the Latin communities beyond the Po, and won the affections of the populace in Rome and its immediate neighbourhood by the splendour of the games which he gave as curule aedile (65), and by his lavish expenditure upon the improvement of the Applan Way. But these measures were with him only means to the further end of creating for himself a position such as that which Pompey had already won; and this ulterior aim he pursued with an audacious indifference to constitutional forms and usages. His coalition with Crassus, soon after Pompey's departure, secured him an ally whose colossal wealth and wide financial connections were of inestimable value, and whose vanity and inferiority of intellect rendered him a willing tool. The story of his attempted *coup d'état* in Jan. 63 is probably false, but it is evident that by the beginning of 63 he was bent on reaping the reward of his exertions by obtaining from the people an extraordinary command

abroad, which should secure his position before Pompey's return; and the agrarian law proposed early that year by the tribune P. Servilius Rullus had for its object the creation, in favour of Caesar and Crassus, of a commission with powers so wide as to place its members almost on a level with Pompey himself. It was at this moment when all seemed going well, that Caesar's hopes were dashed to the ground by Catiline's desperate outbreak, which not only discredited every one connected with the popular party, but directed the suspicions of the well-to-do classes against Caesar himself, as a possible accomplice in Catiline's revolutionary schemes.

The same wave of indignation and suspicion which for the moment checked Caesar's rise carried Marcus Tullius Cicero to the height of his fortunes. Cicero (*q.v.*), as a politician, has been equally misjudged by friends and foes. That he was deficient in courage, that he was vain, and that he attempted the impossible, may be admitted at once. But he was neither a brilliant and unscrupulous adventurer nor an aimless trimmer, nor yet a devoted champion merely of senatorial ascendancy¹. He was a representative man, with a numerous following, and a policy which was naturally suggested to him by the circumstances of his birth, connections and profession, and which, impracticable as it proved to be, was yet consistent, intelligible and high-minded. Born at Arpinum, he cherished like all Arpinates the memory of his great fellow-townsmen Marus, the friend of the Italians, the saviour of Italy and the irreconcilable foe of Sulla and the nobles. A "municipal" himself, his chosen friends and his warmest supporters were found among the well-to-do classes in the Italian towns. Unpopular with the Roman aristocracy, who despised him as a *peregrinus*, and with the Roman populace, he was the trusted leader of the Italian middle class, "the true Roman people," as he proudly styles them. It was they who carried his election for the consulship (63), who in 58 insisted on his recall from exile, and it was his influence with them which made Caesar so anxious to win him over in 49. He represented their antipathy alike to socialist schemes and to aristocratic exclusiveness, and their old-fashioned simplicity of life in contrast with the cosmopolitan luxury of the capital. By birth, too, he belonged to the equestrian order, the foremost representatives of which were indeed still the *publicani* and *negotatores*, but which since the enfranchisement of Italy included also the substantial burgesses of the Italian towns and the smaller "squires" of the country districts. With them, too, Cicero was at one in their dread of democratic excesses and their social and political jealousy of the nobles. Lastly, as a lawyer and a scholar, he was passionately attached to the ancient constitution. His political ideal was the natural outcome of these circumstances. He advocated the maintenance of the old constitution, but not as it was understood by the extreme politicians of the right and left. The senate was to be the supreme directing council, but the senate of Cicero's dreams was not an oligarchic assemblage of nobles, but a body freely open to all citizens, and representing the worth of the community. The magistrates, while deferring to the senate's authority, were to be at once vigorous and public-spirited; and the assembly itself which elected the magistrates and passed the laws was to consist, not of the "mob of the forum," but of the true Roman people throughout Italy. For the realization of this ideal he looked, above all things, to the establishment of cordial relations between the senate and nobles in Rome and the great middle-class of Italy represented by the equestrian order, between the capital and the country towns and districts. This was the *concordia ordinum*, the *consensus Italiae*, for which he laboured.

Cicero's election to the consulship for 63 over the heads of Caesar's nominees, Antonius and Catiline, was mainly the work of the Italian middle-class, already rendered uneasy both by the rumours which were rife of revolutionary schemes and of Caesar's boundless ambition, and by the numerous disquieting signs of disturbance noticeable in Italy. The new consul vigorously set himself to discharge the trust placed in him. He defeated the insidious

proposals of Rullus for Caesar's aggrandizement and assisted in quashing the prosecution of Gaius Rabirius (*q.v.*). But with the consular elections in the autumn of 63 a fresh danger arose from a different quarter. The "conspiracy of Catiline" (*see* CATILINE) was not the work of the popular party, and still less was it an unselfish attempt at reform; Catiline himself was a patrician, who had held high office, and possessed considerable ability and courage; but he was bankrupt in character and in purse, and two successive defeats in the consular elections had rendered him desperate. To retrieve his broken fortunes by violence was a course which was only too readily suggested by the history of the last 40 years, and materials for a conflagration abounded on all sides. The danger to be feared from his intrigues lay in the state of Italy, which made a revolt against society and the established Government only too likely if once a leader presented himself, and it was such a revolt that Catiline endeavoured to organize. Bankrupt nobles like himself, Sullan veterans and the starving peasants whom they had dispossessed of their holdings, outlaws of every description, the slave population of Rome, and the wilder herdsmen-slaves of the Apulian pastures, were all enlisted under his banner, and attempts were even made to excite disaffection among the newly conquered people of southern Gaul and the warlike tribes who still cherished the memory of Sertorius in Spain. In Etruria, the seat and centre of agrarian distress and discontent, a rising actually took place headed by a Sullan centurion, but the spread of the revolt was checked by Cicero's vigorous measures. Catiline fled from Rome, and died fighting with desperate courage at the head of his motley force of old soldiers, peasants and slaves. His accomplices in Rome were arrested, and, after an unavailing protest from Caesar, the senate authorized the consuls summarily to put them to death.

Coalition of Pompey, Caesar and Crassus.—The Catilinarian outbreak had been a blow to Caesar, whose schemes it interrupted, but to Cicero it brought not only popularity and honour, but, as he believed, the realization of his political ideal. But Pompey was now on his way home, and again as in 70 the political future seemed to depend on the attitude which the successful general would assume; Pompey himself looked simply to the attainment by the help of one political party or another of his immediate aims, which at present were the ratification of his arrangements in Asia and a grant of land for his troops. It was the impracticable jealousy of his personal rivals in the senate, aided by the versatility of Caesar who presented himself not as his rival but as his ally, which drove Pompey once more, in spite of Cicero's efforts, into the camp of what was still nominally the popular party. In 60, on Caesar's return from his propraetorship in Spain, the coalition was formed which is known by the somewhat misleading title of the First Triumvirate. Pompey was ostensibly the head of this new alliance, and in return for the satisfaction of his own demands he undertook to support Caesar's candidature for the consulship. The wealth and influence of Crassus were enlisted in the same cause, and the *publicani* were secured by a promise of release from their bargain for collecting the taxes of Asia. Cicero was under no illusions as to the significance of this coalition. It scattered to the winds his dreams of a stable and conservative republic. The year 59 saw the republic powerless in the hands of three citizens. Caesar as consul procured the ratification of Pompey's acts in Asia, granted to the *publicani* the relief refused by the senate, and carried an agrarian law of the new type, which provided for the purchase of lands for allotment at the cost of the treasury and for the assignment of the rich *ager Campanus*. But Caesar aimed at more than the carrying of laws in the teeth of the senate or any party victory in the forum. An important military command was essential to him. An obedient tribune, P. Vatinius, was found, and by the *lex Vatinia* he was given for five years the command of Cisalpine Gaul and Illyricum, to which was added by a decree of the senate Transalpine Gaul also. This command not only opened to him a great military career, but enabled him, as the master of the valley of the Po, to keep an effective watch on the course of affairs in Italy.

¹Mommsen is throughout unfair to Cicero. The best estimates of Cicero are those given by Strachan-Davidson in his Cicero (1894), by Prof. Tyrrell in his Introductions to his edition of Cicero's Letters, and by Peterson, Cicero, a Biography (1920).

²For the history of the next 18 years, the most important ancient authority is Cicero in his letters and speeches.

Early the next year the attack upon himself which Cicero had foreseen was made. P. Clodius (*q.v.*) as tribune brought forward a law enacting that anyone who had put a Roman citizen to death without trial by the people should be interdicted from fire and water. Cicero, finding himself deserted even by Pompey, left Rome in a panic, and by a second Clodian law he was declared to be outlawed. With Caesar away in his province and Cicero banished, Clodius was for the time master in Rome. But, absolute as he was in the streets, and recklessly as he paraded the policy of the Gracchi by violent attacks on the senate, his tribunate merely illustrated the anarchy which now inevitably followed the withdrawal of a strong controlling hand. A reaction speedily followed. Pompey, bewildered and alarmed by Clodius's violence, at last bestirred himself. Cicero's recall was decreed by the senate, and early in Aug. 57 in the *comitia centuriata*, to which his Italian supporters flocked in crowds, a law was passed revoking the sentence of outlawry passed upon him.

Break-up of the Coalition.—Intoxicated by the acclamations which greeted him, and encouraged by Pompey's support, and by the salutary effects of Clodius's excesses, Cicero's hopes rose high. With indefatigable energy he strove to reconstruct a solid constitutional party, but only to fail once more. Pompey was irritated by the hostility of a powerful section in the senate, who thwarted his desires for a fresh command and even encouraged Clodius in insulting the conqueror of the East. Caesar became alarmed at the reports which reached him that the repeal of his agrarian law was threatened and that the feeling against the coalition was growing in strength; above all, he was anxious for a renewal of his five years' command. He acted at once, and in the celebrated conference at Luca (56) the alliance of the three self-constituted rulers of Rome was renewed. Cicero succumbed to the inevitable and withdrew in despair from public life. Pompey and Crassus became consuls for 55. Caesar's command was renewed for another five years, and to each of his two allies important provinces were assigned for a similar period—Pompey receiving the two Spains and Africa, and Crassus Syria. The coalition now divided between them the control of the empire. For the future the question was, how long the coalition itself would last. Its duration proved to be short. In 53 Crassus was defeated and slain by the Parthians at Carrhae, and in Rome the course of events slowly forced Pompey into an attitude of hostility to Caesar. The year 54 brought with it a renewal of the riotous anarchy which had disgraced Rome in 58–57. Conscious of its own helplessness, the senate, with the eager assent of all respectable citizens, dissuaded Pompey from leaving Italy; and as accordingly left his provinces to be governed by his legates. But the anarchy and confusion only grew worse, and even strict constitutionalists like Cicero talked of the necessity of investing Pompey with some extraordinary powers for the preservation of order.¹ At last in 52 he was elected sole consul, and not only so, but his provincial command was prolonged for five years more, and fresh troops were assigned him. The rôle of "saviour of society" thus thrust upon Pompey was one which flattered his vanity, but it entailed consequences which it is probable he did not foresee, for it brought him into close alliance with the senate. In the senate there was a powerful party which was resolved to force him into heading the attack upon Caesar that otherwise they could not successfully make. It was known that Caesar, whose command expired in March 49, but who in the ordinary course of things would not have been replaced by his successor until Jan. 48, was anxious to be allowed to stand for his second consulship in the autumn of 49 without coming in person to Rome. His opponents in the senate were equally bent on bringing his command to an end at the legal time, and so obliging him to disband his troops and stand for the consulship as a private person, or, if he kept his command, on preventing his standing for the consulship. Through 51 and 50 the discussions in the senate and the negotiations with Caesar continued, but with no result. On Jan. 1, 49, Caesar made a last offer of compromise. The senate

replied by requiring him on pain of outlawry to disband his legions. Two tribunes who supported him were ejected from the senate house, and the magistrates with Pompey were authorized to take measures to protect the republic. Caesar hesitated no longer; he crossed the Rubicon and invaded Italy. The rapidity of his advance astounded and bewildered his foes. Pompey, followed by the consuls, by the majority of the senate and a long train of nobles, abandoned Italy as untenable, and crossed into Greece. At the end of March Caesar entered Rome as the master of Italy. Four years later, after the final victory of Munda (45), he became the undisputed master of the Roman world.²

Dictatorship of Caesar, 48–44.—From the very first moment when Pompey's ignominious retreat left him master of Italy, Caesar made it clear that he was neither a second Sulla nor even the reckless anarchist which many believed him to be. The Roman and Italian public were first startled by the masterly rapidity and energy of his movements, and then agreeably surprised by his lenity and moderation. No proscriptions or confiscations followed his victories, and all his acts evinced an unmistakable desire to effect a sober and reasonable settlement of the pressing questions of the hour; of this, and of his almost superhuman energy, the long list of measures he carried out or planned is sufficient proof. The "children of the proscribed" were at length restored to their rights, and with them many of the refugees who had found shelter in Caesar's camp during the two or three years immediately preceding the war; but the extreme men among his supporters soon realized that their hopes of *novae tabulae* and grants of land were illusory. In allotting lands to his veterans, Caesar carefully avoided any disturbance of existing owners and occupiers, and the mode in which he dealt with the economic crisis produced by the war seems to have satisfied all reasonable men. It had been a common charge against Caesar in former days that he paid excessive court to the populace of Rome, and now that he was master he still dazzled and delighted them by the splendour of the spectacles he provided, and by the liberality of his largesses. But he was no indiscriminate flatterer of the mob. The popular clubs and guilds which had helped to organize the anarchy of the last few years were dissolved. A strict enquiry was made into the distribution of the monthly doles of corn, and the number of recipients was reduced by one-half; finally, the position of the courts of justice was raised by the abolition of the popular element among the judges. Nor did Caesar shrink from the attempt, in which so many had failed before him, to mitigate the twin evils which were ruining the prosperity of Italy—the concentration of a pauper population in the towns and the denudation and desolation of the country districts. His strong hand carried out the scheme so often proposed by the popular leaders since the days of Gaius Gracchus, the colonization of Carthage and Corinth. Allotments of land on a large scale were made in Italy; decaying towns were reinforced by fresh drafts of settlers; on the large estates and cattle farms the owners were required to find employment for a certain amount of free labour; and a slight and temporary stimulus was given to Italian industry by the reimposition of harbour dues upon foreign goods.

The reform of the calendar (*q.v.*) completes a record of administrative reform which entitles Caesar to the praise of having governed well, whatever may be thought of the validity of his title to govern at all. But how did Caesar deal with what was after all the greatest problem which he was called upon to solve, the establishment of a satisfactory government for the empire? One point indeed was already settled. Some centralization of the executive authority was indispensable, and this part of his work Caesar thoroughly performed. From the moment when he seized the moneys in the treasury on his first entry into Rome down to the day of his death, he recognized no other authority but his throughout the empire. He alone directed the policy of Rome in foreign affairs; the legions were led, and the provinces governed, not by independent magistrates, but by his legates; and the title *imperator* which he adopted was intended to express the absolute and unlimited nature of the *imperium* he claimed, as distinct

¹For the Civil Wars, see CAESAR, GAIVS JULIVS; CICERO; POMPEY.

²Cicero himself anticipated Augustus in his picture of a *princeps civitatis* sketched in a lost book of the *De republica*, written about this time, which was based upon his hopes of what Pompey might prove to be; *Ad Att.* viii. 11; August *De civ. Dei*, v. 23.

from the limited spheres of authority possessed by republican magistrates. In so centralizing the executive authority over the empire at large, Caesar was but developing the policy implied in the Gabinian and Manilian laws, and the precedent he established was closely followed by his successors. It was otherwise with the more difficult question of the form under which this new executive authority should be exercised and the relation it should hold to the republican constitution.

Caesar did not explain to the public what shape he intended ultimately to give to the new system. It could hardly have been the "perpetual dictatorship" which was decreed him by the senate after his victory at Munda (45). The dictatorship was associated with those very Sullan traditions from which Caesar was most anxious to sever himself, and the name had no value in the empire at large. It was rumoured that he intended to follow Alexander's example and at least in the eastern provinces adopt the title of king with the theocratic associations which the title bore in the East. Roman proconsuls who had served in Asia and had seen the ease with which kings ruled when not hampered by constitutions and privileged to utter decrees that were considered sacred, would well have comprehended the advantages of such divine absolutism. Caesar might readily remain in the East for some years after his Parthian campaign, and while busy reorganizing the provinces there he would incur his court and the senators in his train to accept the new *rex*. When the time was ripe he might proclaim the title at Rome, and then, being recognised as more than human and above legal restrictions, he could carry whatever reforms he desired by decree. That these rumours deserve some credit we may believe, not only because Caesar before his death accepted several "divine" honours from the senate, but also because Mark Antony, who knew Caesar's plans, pursued such a course after Caesar's death. It is not unlikely that Caesar intended some day to accept for himself the position of an absolute monarch like Alexander or Ptolemy Philadelphus.¹ But he was well aware that it would require many years of training to prepare the senate for the announcement.

The old constitution was not formally abrogated. The senate met and deliberated; the assembly passed laws and elected magistrates; there were still consuls, praetors, aediles, quaestors and tribunes; and Caesar himself, like his successors, professed to hold his authority by the will of the people. But senate, assembly and magistrates were all alike subordinated to the paramount authority of the dictator; and this subordination was, in appearance at least, more direct and complete under the rule of Caesar than under that of Augustus. For months together Rome was left without any regular magistrates, and was governed like a subject town by Caesar's prefects. At another time a tribune was seen exercising authority outside the city bounds and invested with the *imperium* of a praetor. At the elections, candidates appeared before the people backed by a written recommendation from the dictator, which was equivalent to a command. Finally, the senate itself was transformed out of all likeness to its former self by the raising of its numbers to 900, and by the admission of old soldiers, sons of freedmen and even "semi-barbarous Gauls." But, though Caesar's high-handed conduct in this respect was not imitated by his immediate successors, yet the main lines of their policy were laid down by him. These were: (1) the municipalization of the old republican constitution, and (2) its subordination to the paramount authority of the master of the legions and the provinces. In the first case he only carried farther a change already in progress. Of late years the senate had been rapidly losing its hold over the empire at large. Even the ordinary proconsuls were virtually independent potentates, ruling their provinces as they chose, and disposing absolutely of legions which recognized no authority but theirs. The consuls and praetors of each year had since 81 been stationed in Rome, and immersed in purely municipal business; and, lastly, since the enfranchisement of Italy, the *comitia*, though still recognized as the ultimate source of all authority, had become little more than assemblies of the city populace, and their claim to represent the true Roman people was indignantly questioned, even by republicans like

Cicero. The concentration in Caesar's hands of all authority outside Rome completely and finally severed all real connection between the old institutions of the republic of Rome and the Government of the Roman empire. But the institutions of the republic not merely became, what they had originally been, the local institutions of the city of Rome; they were also subordinated even within these narrow limits to the paramount authority of the man who held in his hands the army and the provinces. Autocratic abroad, at home he was the chief magistrate of the commonwealth; and this position was marked, in his case as in that of those who followed him, by a combination in his person of various powers, and by a general right of precedence which left no limits to his authority but such as he chose to impose upon himself. During the greater part of his reign he was consul as well as dictator. In 48, after his victory at Pharsalia, he was given the *tribunicia potestas* for life, and after his second success at Thapsus the *praefectura morum* for three years. As chief magistrate he convoked and presided in the senate, nominated candidates, conducted elections, carried laws in the assembly and administered justice in court. Finally, as a reminder that the chief magistrate of Rome was also the autocratic ruler of the empire, he wore even in Rome the laurel wreath and triumphal dress, and carried the sceptre of the victorious imperator.

Nor are we without some clue as to the policy which Caesar had sketched out for himself in the administration of the empire, the government of which he had centralized in his own hands. The much needed work of rectifying the frontiers he was forced, by his premature death, to leave to other hands, but within the frontiers he anticipated Augustus in lightening the financial burdens of the provincials, and in establishing a stricter control over the provincial governors, while he went beyond him in his desire to consolidate the empire by extending the Roman franchise and admitting provincials to a share in the Government. He completed the Romanization of Italy by his enfranchisement of the Transpadane Gauls, and by establishing throughout the peninsula a uniform system of municipal government, which under his successors was gradually extended to the provinces.

The Second Triumvirate, 43-28.—On the eve of his departure for the East, to avenge the death of Crassus and humble the power of Parthia, Caesar fell a victim to the republican nobles; and between the day of his death (March 15, 44) and that on which Octavian defeated Antony at Actium (Sept. 2, 31) lies a dreary period of anarchy and bloodshed.

For a moment, in spite of the menacing attitude of Caesar's self-constituted representative Marcus Antonius (Mark Antony), it seemed to one man at least as if the restoration of republican government was possible. With indefatigable energy Cicero strove to enlist the senate, the people, and above all the provincial governors in support of the old constitution. But, though his eloquence now and again carried all before it in senate house and forum, it was powerless to alter the course of events. By the beginning of 43 civil war had recommenced; in the autumn Antony was already threatening an invasion of Italy at the head of 17 legions. Towards the end of October Antony and his ally M. Aemilius Lepidus coalesced with the young Octavian, who had been recently elected consul at the age of 20, in spite of senatorial opposition; and the coalition was legalized by the creation of the extraordinary commission for the "reorganization of the commonwealth" known as the Second Triumvirate. It was appointed for a period of five years, and was continued in 37 for five years more. The rule of the triumvirs was inaugurated in the Sullan fashion by a proscription, foremost among the victims of which was Cicero himself. In the next year the defeat of M. Junius Brutus and C. Cassius Longinus at Philippi, by the combined forces of Octavian and Antony, destroyed the last hopes of the republican party. In 40 a threatened rupture between the two victors was avoided by the treaty concluded at Brundisium. Antony married Octavian's sister Octavia, and took command of the eastern half of the empire; Octavian appropriated Italy and the West; while Lepidus was forced to content himself with Africa. For the next 12 years, while Antony was indulging in

dreams of founding for himself and Cleopatra an empire in the East, and shocking Roman feeling by his wild excesses and his affectation of Oriental magnificence, Octavian was patiently consolidating his power. Lepidus, his fellow-triumvir, was in 36 ejected from Africa and banished to Circé, while Sextus Pompeius, who had since his defeat at Munda maintained a semi-principate ascendancy in the western Mediterranean, was decisively defeated in the same year, and his death in 35 left Octavian sole master of the West. The inevitable trial of strength between himself and Antony was not long delayed. In 32 Antony openly challenged the hostility of Octavian by divorcing Octavia in favour of the beautiful and daring Egyptian princess, with whom, as the heiress of the Ptolemies, he aspired to share the empire of the eastern world. By a decree of the senate Antony was declared deposed from his command, and war was declared against Queen Cleopatra. On Sept. 2, 31, was fought the battle of Actium. Octavian's victory was complete. Antony and Cleopatra committed suicide (30), and the eastern provinces submitted in 29. Octavian returned to Rome to celebrate his triumph and mark the end of the long-continued anarchy by closing the temple of Janus; at the end of the next year he formally laid down the extraordinary powers which he had held since 43, and a regular Government was established.

III. THE EMPIRE

Period I: The Principate, 27 B.C.-A.D. 284.—The Constitution of the Principate.—The conqueror of Antonius at Actium, the great-nephew and heir of the dictator Caesar, was now summoned, by the general consent of a world wearied out with 20 years of war and anarchy, to the task of establishing a Government which should as far as possible respect the forms and traditions of the republic, without sacrificing that centralization of authority which experience had shown to be necessary for the integrity and stability of the empire.

The new system which was formally inaugurated by Octavian in 28-27 B.C. assumed the shape of a restoration of the republic under the leadership of a *princeps*. Octavian voluntarily resigned the extraordinary powers which he had held since 43, and, to quote his own words, "handed over the republic to the control of the senate and people of Rome." The old constitutional machinery was once more set in motion; the senate, assembly and magistrates resumed their functions; and Octavian himself was hailed as the "restorer of the commonwealth and the champion of freedom." But his abdication, in any real sense of the word, would have simply thrown everything back into confusion. Any revival of the kingly title was out of the question, and Octavian himself expressly refused the dictatorship. Nor was any new office created or any new official title invented for his benefit. But by senate and people he was invested according to the old constitutional forms with certain powers, as many citizens had been before him, and so took his place by the side of the lawfully appointed magistrates of the republic—only, to mark his pre-eminent dignity, as the first of them all, the senate decreed that he should take as an additional cognomen that of "Augustus," while in common parlance he was henceforth styled *princeps*, a simple title of courtesy, familiar to republican usage, and conveying no other idea than that of a recognized primacy and precedence over his fellow-citizens. The ideal sketched by Cicero in his *De Republica*, of a constitutional president of a free republic, was apparently realized; but it was only in appearance. For in fact the special prerogatives conferred upon Octavian gave him back in substance the autocratic authority he had resigned, and as between the restored republic and its new *princeps* the balance of power was overwhelmingly on the side of the latter.

Octavian had held the *imperium* since 43; in 33, it is true, the powers of the triumvirate had legally expired, but he had continued to wield his authority, as he himself puts it, "by universal consent." In 27 he received a formal grant of the *imperium* from the senate and people for the term of ten years, and his *provincia* was defined as including all the provinces in which military authority was required and legions were stationed. He was declared commander-in-chief of the Roman army, and granted the

exclusive right of levying troops, of making war and peace, and of concluding treaties. As consul, moreover, he not only continued to be the chief magistrate of the State at home, but took precedence in virtue of his *maius imperium*, over the governors of the "unarmed provinces," which were still nominally under the control of the senate. Thus the so-called "restoration of the republic" was in essence the recognition by law of the personal supremacy of Octavian, or Augustus, as he must henceforth be called.

In 23 an important change was made in the formal basis of Augustus's authority. In that year he laid down the consulship which he had held each year since 31, and could therefore only exert his *imperium pro consule*, like the ordinary governor of a province. He lost his authority as chief magistrate in Rome and his precedence over the governors of senatorial provinces. To remedy these defects a series of extraordinary offices were pressed upon his acceptance; but he refused them all, and caused a number of enactments to be passed which determined the character of the principate for the next three centuries. First, he was exempted from the disability attaching to the tenure of the *imperium* by one who was not an actual magistrate, and permitted to retain and exercise it in Rome. Secondly, his *imperium* was declared to be equal with that of the consuls, and therefore superior to that of all other holders of that power. Thirdly, he was granted equal rights with the consuls of convening the senate and introducing business, of nominating candidates at elections, and of issuing edicts. Lastly, he was placed on a level with the consuls in outward rank. Twelve lictors were assigned to him and an official seat between those of the consuls themselves.

Tribunicia Potestas.—Thus the proconsular authority was for the time admitted within the walls of Rome; but Augustus was too cautious a statesman to proclaim openly the fact that the power which he wielded in the city was the same as that which exercised in camps and provinces by a Roman military commander. Hence he sought for a title which should disguise the nature of his authority, and found it in the "tribunician power," which had been conferred upon him for life in 36, and was well suited, from its urban and democratic traditions, to serve in Rome as "a term to express his supreme position." From 23 onwards the *tribunicia potestas* appears after his name in official inscriptions, together with the number indicating the period during which it had been held (also reckoned from 23); it was in virtue of this power that Augustus introduced the social reforms which the times demanded; and, though far inferior to the *imperium* in actual importance, it ranked with or even above it as a distinctive prerogative of the emperor or his chosen colleague.

The *imperium* and the *tribunicia potestas* were the two pillars upon which the authority of Augustus rested, and the other offices and privileges conferred upon him were of secondary importance. After 23 he never held the consulship save in 5 and 2 A.C., when he became the colleague of his grandsons on their introduction to public life. He permitted the triumvir Lepidus to retain the chief pontificate until his death, when Augustus naturally became *pontifex maximus* (12 B.C.). He proceeded with the like caution in reorganizing the chief departments of the public service in Rome and Italy. The *cura annonae*, i.e., the supervision of the corn supply of Rome, was entrusted to him in 22 B.C., and this important branch of administration thus came under his personal control; but the other boards (*curae*), created during his reign to take charge of the roads, the water-supply, the regulation of the Tiber and the public buildings, were composed of senators of high rank, and regarded in theory as deriving their authority from the senate.

Such was the ingenious compromise by which room was found for the master of the legions within the narrow limits of the old Roman constitution. Augustus could say with truth that he had accepted no office which was "contrary to the usage of our ancestors," and that it was only in *auctoritas* that he took precedence of his colleagues. Nevertheless, as every thinking man must have realized, the compromise was unreal, and its significance

¹See Ramsay and Primerstein. *Mon. Antich.* iv. 3 (1927).

icance was ambiguous. It was an arrangement avowedly of an exceptional and temporary character, yet no one could suppose that it would in effect be otherwise than permanent. The powers voted to Augustus were (like those conferred upon Pompey in 67 B.C.) voted only to him, and (save the *tribunicia potestas*) voted only for a limited time; in 27 he received the *imperium* for ten years, and it was afterwards renewed for successive periods of five, five, ten and ten years. In this way the powers of the principate were made coextensive in time with the life of Augustus, but there was absolutely no provision for hereditary or any other form of succession, and various expedients were devised in order to indicate the destined successor of the *principes* and to bridge the gap created by his death. Ultimately Augustus associated his stepson Tiberius with himself as co-regent. The *imperium* and the *tribunicia potestas* were conferred upon him, and he was thus marked out as the person upon whom the remaining powers of the principate would naturally be bestowed after the death of his stepfather. But succeeding emperors did not always indicate their successors so clearly, and, in direct contrast to the maxim that "the king never dies," it has been well said that the Roman principate died with the death of the *principes*.

Changes in the Constitution of the Principate.—In theory, at least, the Roman world was governed according to the "maxims of Augustus" (Suet. *Ner.* 10), down to the time of Diocletian. Even in the 3rd century there is still in name at least a republic, of which the emperor is in strictness only the chief magistrate, deriving his authority from the senate and people, and with prerogatives limited and defined by law. The case is quite different when we turn from theory to practice. The division of authority between the republic and its chief magistrate became increasingly unequal. Over the provinces the *principes* from the first ruled autocratically; and this autocracy reacted upon his position in Rome, so that it became every year more difficult for a ruler so absolute abroad to maintain even the fiction of republican government at home. The republican institutions, with the partial exception of the senate, lose all semblance of authority outside Rome, and even as the municipal institutions of the chief city of the empire they retain but little actual power. The real government even of Rome passes gradually into the hands of imperial prefects and commissioners, and the old magistracies become merely decorations which the emperor bestows at his pleasure. At the same time the rule of the *principes* assumes an increasingly personal character, and the whole work of government is silently concentrated in his hands and in those of his own subordinates. Closely connected with this change is the different aspect presented by the history of the empire in Rome and Italy on the one hand and in the provinces on the other. Rome and Italy share in the decline of the republic. Political independence and activity die out; their old pre-eminence and exclusive privileges gradually disappear; and at the same time the weight of the overwhelming power of the *principes*, and the abuses of their power by individual *principes*, press most heavily upon them. On the other hand, in the provinces and on the frontiers, where the imperial system was most needed, and where from the first it had full play, it is seen at its best as developing or protecting an orderly civilization and maintaining the peace of the world.

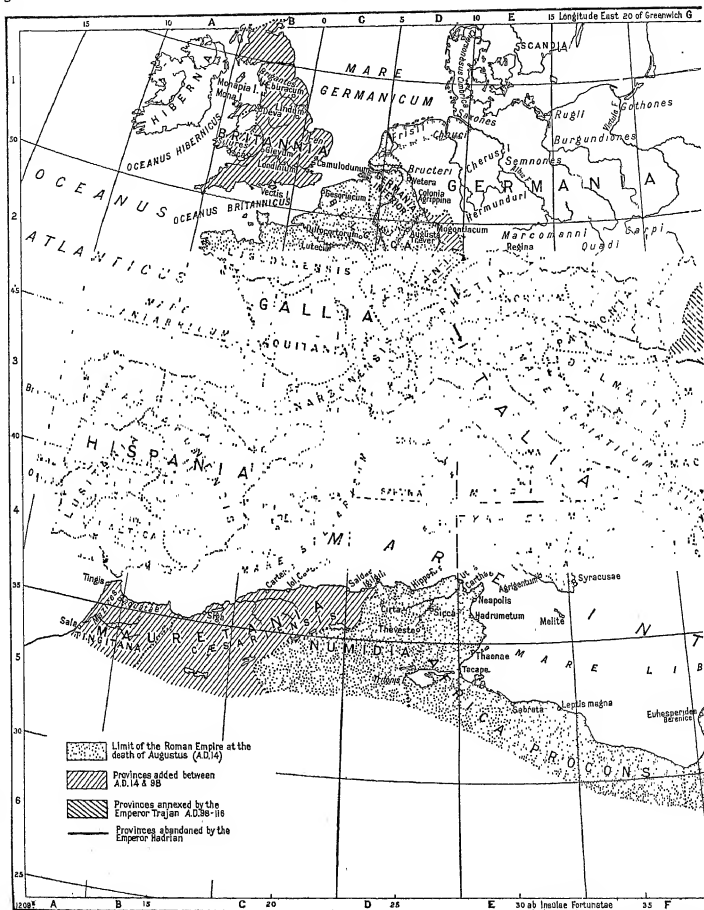

The decay of the republican institutions had commenced before the revolutionary crisis of 49. It was accelerated by the virtual suspension of regular government between 49 and 28; and not even the diplomatic deference towards ancient forms which Augustus displayed availed to conceal the unreality of his work of restoration. The *comitia* received back from him "their ancient rights" (Suet. *Aug.* 40), and during his lifetime they continued to pass laws and to elect magistrates. But after the end of the reign of Tiberius we have only two instances of legislation by the assembly in the ordinary way¹, and the law-making of the empire is performed either by decrees of the senate or by imperial edicts and constitutions. Their prerogative of electing magistrates was, even under Augustus, robbed of most of its importance by the control which the *principes* exercised

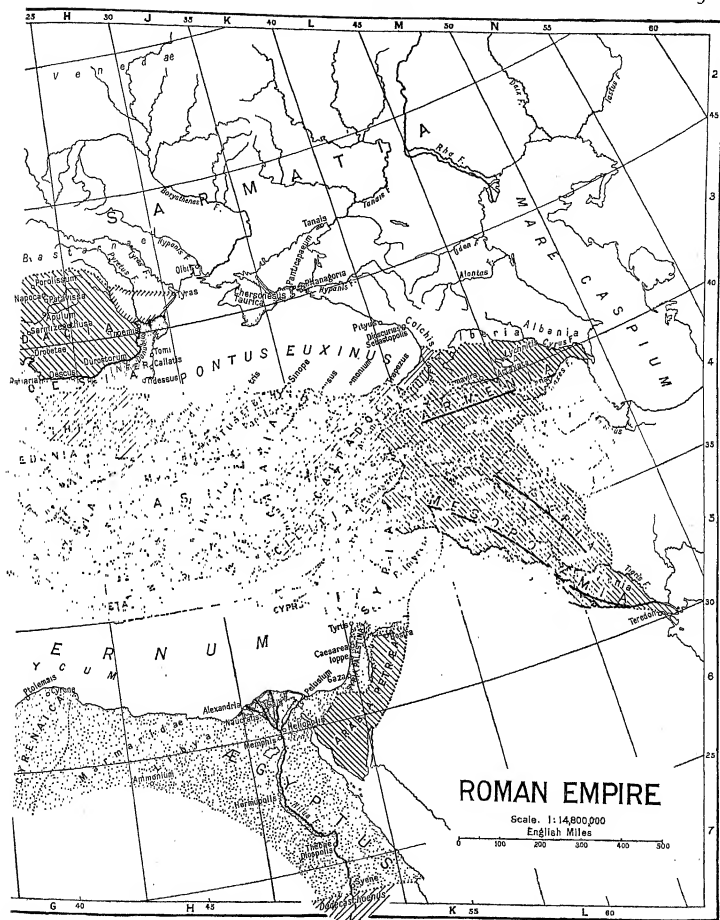

over their choice by means of his rights of nomination and commendation, which effectually secured the election of his own nominees. By Tiberius this restricted prerogative was still further curtailed. The candidates for all magistracies except the consulship were thenceforward nominated and voted for in the senate house and by the senators, and only the formal return of the result (*renuntiatio*) took place in the assembly (Dio lxxviii. 20). The *principes* himself as long as the principate lasted, continued to receive the *tribunicia potestas* by a vote of the assembly, and was thus held to derive his authority from the people.

This almost complete effacement of the *comitia* was largely due to the fact that they had ceased to represent anything but the populace of Rome, and the comparatively greater vitality shown by the old magistracies is mainly attributable to the value they continued to possess in the eyes of the Roman upper class. But, though they were eagerly sought (Plin. *Epp.* ii. 9, vi. 6), and conferred on their holders considerable social distinction, the magistracies ceased, except in name, to be the popularly chosen executive officers of the Roman State. In the administration of the empire at large they had no share, if we except the subordinate duties still assigned to the quaestor in a province. In Rome, to which their sphere of work was limited, they were overshadowed by the dominant authority of the *principes*, while their range of duties was increasingly circumscribed by the gradual transference of administrative authority, even within the city, to the emperor and his subordinate officials.

The senate alone among republican institutions retained some importance and influence, and it thus came to be regarded as sharing the government of the empire with the *principes* himself. It nominally controlled the administration of Italy and of the "public provinces," whose governors it appointed. It is to the senate, in theory, that the supreme power reverts in the absence of a *principes*. It is by decree of the senate that the new *principes* immediately receives his powers and privileges, though he is still supposed to derive them ultimately from the people. After the cessation of all legislation by the *comitia*, the only law-making authority, other than that of the *principes* by his edicts, was that of the senate by its decrees. Its judicial authority was co-ordinate with that of the emperor, and at the close of the 1st century we find the senators claiming, as the emperor's "peers," to be exempt from his jurisdiction. But in spite of the outward dignity of its position, and of the deference with which it was frequently treated, the senate became gradually almost as powerless in reality as the *comitia* and the magistracies. The senators continued indeed to be taken as a rule from the ranks of the wealthy, and a high property qualification was established by Augustus as a condition of membership; but this merely enabled the emperors to secure their own ascendancy by subsidizing those whose property fell short of the required standard, and who thus became simply the paid creatures of their imperial patrons. Admission to the senate was possible only by favour of the emperor, both as controlling the elections to the magistracies, which still gave entrance to the curia, and as invested with the power of directly creating senators by *adlectio*, a power which from the time of Vespasian onwards was freely used. As the result, the composition of the senate rapidly altered. Under Augustus and Tiberius it still contained many representatives of the old republican families, whose prestige and ancestral traditions were some guarantee for their independence. But this element soon disappeared. The ranks of the old nobility were thinned by natural decay and by the jealous fears of the last three Claudian emperors. Vespasian flooded the senate with new men from the municipal towns of Italy and the Latinized provinces of the West. Trajan and Hadrian, both provincials themselves, carried on the same policy, and by the close of the 2nd century even the Greek provinces of the East had their representatives in the senate. Some, no doubt, of these provincials, who constituted the great majority of the senate in the 3rd century, were men of wealth and mark, but many more were of low birth; for some rested the stain of a servile descent, and all owed alike their present position and their chances of further promotion to the emperor. The procedure of the senate was as completely

¹The *plebiscita* of Claudius, Tac. *Ann.* xi. 13, 14, and the *lex agraria* of Nerva; *Digest*, xlviii. 25, 3; Dio lxxviii. 2; Plin. *Epp.* vii. 32.

at the mercy of the *princeps* as its composition. He was himself a senator and the first of senators; he possessed the magisterial prerogatives of convening the senate, of laying business before it, and of carrying *senatus consulta*; above all, his tribunician power enabled him to interfere at any stage, and to modify or reverse its decisions. The share of the senate in the government was in fact determined by the amount of administrative activity which each *princeps* saw fit to allow it to exercise, and this share became steadily smaller. The jurisdiction assigned it by Augustus and Tiberius was in the 3rd century limited to the hearing of such cases as the emperor thought fit to send for trial, and these became steadily fewer in number. Its control of the State treasury, as distinct from the imperial *fiscus*, was in fact little more than nominal, and became increasingly unimportant as the great bulk of the revenue passed into the hands of the emperor.

The process by which all authority became centralized in the hands of the *princeps* and in practice exercised by an organized bureaucracy was of necessity gradual; but it had its beginnings under Augustus, who formed the equestrian order (admission to which was henceforth granted only by him) into an imperial service, partly civil and partly military, whose members, being immediately dependent on the emperor, could be employed on tasks which it would have been impossible to assign to senators (*see* EQUITES). From this order were drawn the armies of "procurators"—the term was derived from the practice of the great business houses of Rome—who administered the imperial revenues and properties in all parts of the empire. Merit was rewarded by independent governorships such as those of Raetia and Noricum, or the command of the naval squadrons at Misenum and Ravenna; and the prizes of the knight's career were the prefectures of the praetorian guard, the corn-supply and the city police, and the governorship of Egypt. The household offices and imperial secretariats were held by freedmen, almost always of Greek origin, whose influence became all-powerful under such emperors as Claudius. The financial secretary (*a rationibus*) and those who dealt with the emperor's correspondence (*ab epistulis*) and with petitions (*a libellis*) were the most important of these.

Caesar Worship.—This increase of power was accompanied by a corresponding elevation of the *princeps* himself above the level of all other citizens. The comparatively modest household and simple life of Augustus were replaced by a more than regal splendour, and under Nero we find all the outward accessories of monarchy present, the palace, the palace guards, the crowds of courtiers and a court ceremonial. In direct opposition to the republican theory of the principate, members of the family of the *princeps* share the dignities of his position. The males bear the cognomen of Caesar, and are invested, as youths, with high office; their names and even those of the females are included in the yearly prayers for the safety of the *princeps*; their birthdays are kept as festivals; the praetorian guards take the oath to them as well as to the *princeps* himself.

These honours culminate in the "imperial cult" which most definitely marks the vast distance between republican and imperial Rome. Julius Caesar, for policy's sake, had been enticed by Alexander's example to attempt the introduction of autocracy in the only form known in the ancient world. The East was accustomed to accepting commands from the semi-divine king and made no objection, and since half the population of Rome now consisted of the stock of slaves and captives the plan met with noisy applause by the lowest classes at Rome. But Brutus's dagger was the senate's answer to the proposal. Octavian, who rested his hopes of succession on the favour of Caesar's devout soldiers and on the sacred character of Caesar's last will and testament, did all in his power to canonize Julius, and built a temple to *Divus Iulius* in the Forum. This sufficed for his immediate purpose, and when he consolidated his position after Antony's defeat he wisely forbade the bestowal of divine honours upon himself within Italy while welcoming deification in Asia and Egypt where the populace could not understand why the successor of Ptolemies and Seleucids kings should not be a god. However, even in Italy the Oriental ex-slave population, very numerous everywhere, would revert to non-Roman mysticism.

Here and there in Italy shrines arose and were permitted, not to Augustus, but to the "genius" of Augustus, and in 12 B.C. the court devised an organization of ex-slaves in the towns of Italy for devotions to the Augustan *lares*. Thus the Oriental cult crept in gradually. And as the worship of Augustus by the eastern provincial communes seemed to the court to be a pleasing token of loyalty, attempts were also made officially to introduce the worship at the meetings of the provincial gatherings in Gaul, Spain and Africa. But it must be said that, except so far as Orientals took part in the worship, in the West it was and remained to the end merely lip service. As the cult was worked out for Italy after Augustus's death the emperors were deified only after death and the worship was directed to the *Divi*. But in the provinces the worship of the living ruler continued. The image of the living emperor was on the army standards and was made the object of devotion, and refusal to perform libations to it became the ugliest test of treason and of heterodoxy. A few emperors, like Caligula and Domitian, attempted to invite, while living, the honours of *Divi* even in Rome, but with little success. Diocletian was the first emperor who actually brought into the very senate the worship of the emperor as it was practised all through the empire in Asiatic cities, and he had his capital in Asia.

The Frontiers.—To secure peace it was necessary to establish on all sides of the empire really defensible frontiers; and this became possible now that for the first time the direction of the foreign policy of the state and of its military forces was concentrated in the hands of a single magistrate. To the south and west the generals of the republic, and Caesar himself, had extended the authority of Rome to the natural boundaries formed by the African deserts and the Atlantic ocean, and in these two directions Augustus's task was in the main confined to the organization of a settled Roman government within these limits. In Africa the client state of Egypt was ruled by Augustus as the successor of the Ptolemies, and administered by his deputies (*praefecti*), and the kingdom of Numidia (25 B.C.) was incorporated with the old province of Africa. In Spain the hill-tribes of the north-west were finally subdued and a third province, Lusitania, established. In Gaul Augustus (27 B.C.) established in addition to the "old province" the three new ones of Aquitania, Lugdunensis and Belgica, which included the territories conquered by Julius Caesar. Towards the north the republic had left the civilized countries bordering on the Mediterranean with only a very imperfect defence against the threatening mass of barbarian tribes beyond them. The result of Augustus's policy was to establish a protecting line of provinces running from the Euxine to the North sea, and covering the peaceful districts to the south—Moesia (A.D. 6), Pannonia (A.D. 9), Noricum (15 B.C.), Raetia (15 B.C.) and Gallia Belgica. Roman rule was thus carried up to the natural frontier lines of the Rhine and the Danube. It was originally intended to make the Elbe the frontier of the empire; but after the defeat of P. Quintilius Varus (A.D. 9) the forward policy was abandoned. Tiberius recalled Germanicus as soon as Varus had been avenged; and after the peace with Maroboduus, the chief of the Marcomanni on the upper Danube, in the next year (A.D. 17), the defensive policy recommended by Augustus was adopted along the whole of the northern frontier. The line of the great rivers was held by an imposing mass of troops. Along the Rhine lay the armies of Upper and Lower Germany, consisting of four legions each; eight more guarded the Danube and the frontiers of Pannonia and Moesia. At frequent intervals along the frontier were the military colonies, the permanent camps and the smaller intervening *castella*. Flotillas of galleys cruised up and down the rivers, and Roman roads opened communication both along the frontiers and with the seat of government in Italy.

In the East, Rome was confronted with a well organized and powerful State whose claims to empire were second only to her own. The victory of Carrhae (53 B.C.) had encouraged among the Parthians the idea of an invasion of Syria and Asia Minor, while it had awakened in Rome a genuine fear of the formidable power which had so suddenly arisen in the East. Caesar was at the moment of his death preparing to avenge the death of Crassus by

L. R. Taylor, in *Trans. Amer. Phil. Assn.* 1920, 116.

an invasion of Parthia, and Antony's schemes of founding an Eastern empire which should rival that of Alexander included the conquest of the kingdom beyond the Euphrates. Augustus, however, adhered to the policy which he recommended to his successors of "keeping the empire within its bounds"; and the Parthians, weakened by internal feuds and dynastic quarrels, were in no mood for vigorous action. Roman pride was satisfied by the restoration of the standards taken at Carrhae. Four legions guarded the line of the Euphrates, and, beyond the frontiers of Pontus and Cappadocia, Armenia was established as a "friendly and independent ally."

The Provinces.—Next in importance to the rectification and defence of the frontiers was the reformation of the administration, and the restoration of prosperity to the distracted and exhausted provinces. The most serious defect of the republican system had been the absence of any effective control over the Roman officials outside Italy. This was now supplied by the general proconsular authority vested in the emperor. The provinces were for the first time treated as departments of a single State, while their governors, from being independent and virtually irresponsible rulers, became the subordinate officials of a higher authority. Over the *legati* of the imperial provinces the control of the emperor was as complete as that of the republican proconsul over his staff in his own province. They were appointed by him, held office at his good pleasure, and were directly responsible to him for their conduct. The proconsuls of the senatorial provinces were in law magistrates equally with the *princeps*, though inferior to him in rank; it was to the senate that they were, as of old, responsible; they were still selected by lot from among the senators of consular and praetorian rank. But the distinction did not seriously interfere with the paramount authority of the emperor. The provinces left nominally to the senate were the more peaceful and settled districts in the heart of the empire, where only the routine work of civil administration was needed, and where the local municipal governments were as yet comparatively vigorous. The senatorial proconsuls themselves were indirectly nominated by the emperor through his control of the praetorship and consulship. They wielded no military and only a strictly subordinate financial authority, and, though Augustus and Tiberius, at any rate, encouraged the fiction of the responsibility of the senatorial governors to the senate, it was in reality to the emperor that they looked for direction and advice, and to him that they were held accountable. Moreover, in the case of all governors this accountability became under the empire a reality. Prosecutions for extortion (*de pecuniis repetundis*), which were now transferred to the hearing of the senate, were tolerably frequent during the first century of the empire; but a more effective check on maladministration lay in the appeal to Caesar from the decisions of any governor, which was open to every provincial, and in the right of petition. Finally, the authority both of the legate and the proconsul was weakened by the presence of the imperial procurator, to whom was entrusted the administration of the fiscal revenues; while both legate and proconsul were deprived of that right of requisitioning supplies which, in spite of a long series of restrictive laws, had been the most powerful instrument of oppression in the hands of republican governors. The financial reforms of Augustus are marked by the same desire to establish an equitable, orderly and economical system, and by the same centralization of authority in the emperor's hands. The institution of an imperial census or valuation of all land throughout the empire, and the assessment upon this basis of a uniform land tax, in place of the heterogeneous and irregular payments made under the republic, were the work of Augustus, though the system was developed and perfected by the emperors of the 2nd century and by Diocletian. The land tax itself was directly collected, either by imperial officials or by local authorities responsible to them, and the old wasteful plan of selling the privilege of collection to *publicani* was henceforward applied only to such indirect taxes as the customs duties. The rate of the land tax was fixed by the emperor, and with him rested the power of remission even in senatorial provinces. The effect of these reforms is clearly visible in the improved financial

condition of the empire. Under the republic the treasury had been nearly always in difficulties, and the provinces exhausted and impoverished. Under the emperors, at least throughout the 1st century, in spite of a largely increased expenditure on the army, on public works, on shows and largesses, and on the machinery of government itself, the better emperors, such as Tiberius and Vespasian, were able to accumulate large sums, while the provinces showed but few signs of distress. Moreover, while the republic had almost entirely neglected to develop the internal resources of the provinces, Augustus set the example of a liberal expenditure on public works, in the construction of harbours, roads and bridges, the reclamation of waste lands and the erection of public buildings.

The Julio-Claudian Line.—Augustus founded a dynasty which occupied the throne for more than half a century after his death. The first and by far the ablest of its members was Tiberius (A.D. 14-37). He was undoubtedly a capable and vigorous ruler, who enforced justice in the government of the provinces, maintained the integrity of the frontiers and husbanded the finances of the empire, but he became intensely unpopular in Roman society, and was painted as a cruel and odious tyrant. His successor, Gaius (A.D. 37-41), generally known as Caligula, was the slave of his wild caprices and uncontrolled passions, which issued in manifest insanity. He was followed by his uncle, Claudius (A.D. 41-54), whose personal uncouthness made him an object of derision to his contemporaries, but who was by no means devoid of statesmanlike faculties. His reign left an abiding mark on the history of the empire, for he carried forward its development on the lines intended by Augustus. Client-states were absorbed, southern Britain was conquered, the romanization of the West received a powerful impulse, public works were executed in Rome and Italy, and the organization of the imperial bureaucracy made rapid strides. Nero (A.D. 54-68), the last of the Julio-Claudian line, has been handed down to posterity as the incarnation of monstrous vice and fantastic luxury. But his wild excesses scarcely affected the prosperity of the empire at large; the provinces were well governed, and the war with Parthia led to a compromise in the matter of Armenia which secured peace for half a century.

The Antonine Empire.—The fall of Nero and the extinction of the "progeny of the Caesars" was followed by a war of succession which revealed the military basis of the principate and the weakness of the tie connecting the emperor with Rome. Galba, Otho, Vitellius and Vespasian represented in turn the legions of Spain, the household troops, the army of the Rhine, and a coalition of the armies of the Danube and the Euphrates; and all except Otho were already *de facto* emperors when they entered Rome. The final survivor in the struggle, Vespasian (A.D. 70-79), was a man of comparatively humble origin, and as the principate ceased to possess the prestige of high descent it became imperatively necessary to remove, as far as possible, the anomalies of the office and to give it a legitimate and permanent form. Thus we find an elaborate and formal system of titles substituted for the personal names of the Julio-Claudian emperors, an increasing tendency to insist on the inherent prerogatives of the principate (such as the censorial power), and an attempt to invest Caesarism with an hereditary character, either by natural descent or by adoption, while the worship of the *Divi*, or deified Caesars, was made the symbol of its continuity and legitimacy. The dynasty of Vespasian and his sons (Titus, A.D. 79-81, Domitian, A.D. 81-96) became extinct on the murder of the last named, whose high-handed treatment of the senate earned him the name of a tyrant; his successor, Nerva (A.D. 96-98), opened the series of "adoptive" emperors (Trajan, A.D. 98-117, Hadrian, 117-138, Antoninus Pius, 138-161, Marcus Aurelius 161-180) under whose rule the empire enjoyed a period of internal tranquillity and good government. Its boundaries were extended by the subjugation of northern Britain by Agricola, A.D. 78-84 (see BRITAIN: Roman), by the annexation of the districts included in the angle of the Rhine and Danube under the Flavian emperors, and by the conquest of Dacia (the modern Transylvania) under Trajan (completed in A.D. 106). Trajan also annexed Arabia

Petraea and in his closing years invaded Parthia and formed provinces of Armenia, Mesopotamia and Assyria; but these conquests were surrendered by his successor, Hadrian, who set himself to the task of consolidating the empire and perfecting its defences. To him is due the system of permanent *limites* or frontier fortifications, such as the wall which protected northern Britain and the palisade which replaced the chain of forts established by the Flavian emperors from the Rhine to the Danube. The construction of these defences showed that the limit of expansion had been reached, and under M. Aurelius the tide began to turn. A great part of his reign was occupied with wars against the Marcomanni, Quadi, Sarmatians, etc., whose irruptions seriously threatened the security of Italy. Henceforth Rome never ceased to be on the defensive.

Within the frontiers the levelling and unifying process commenced by Augustus had steadily proceeded. A tolerably uniform provincial system covered the whole area of the empire. The client-states had one by one been reconstituted as provinces, and even the government of Italy had been in many respects assimilated to the provincial type. The municipal system had spread widely; the period from Vespasian to Aurelius witnessed the elevation to municipal rank of an immense number of communities, not only in the old provinces of the West, in Africa, Spain and Gaul, but in the newer provinces of the North, and along the line of the northern frontier; and everywhere under the influence of the central imperial authority there was an increasing uniformity in the form of the local constitutions, framed and granted as they all were by imperial edict. Throughout the empire again the extension of the Roman franchise was preparing the way for the final act by which Caracalla assimilated the legal status of all free-born inhabitants of the empire, and in the west and north this was preceded and accompanied by the complete romanizing of the people in language and civilization. Yet, in spite of the internal tranquillity and the good government which have made the age of the Antonines famous, we can detect signs of weakness. It was in this period that the centralization of authority in the hands of the *principes* was completed; the "dual control" established by Augustus, which had been unreal enough in the 1st century, was now, though not formally abolished, systematically ignored in practice. The senate ceased to be an instrument of government, and became an imperial peerage, largely composed of men not qualified by election to the quaestorship but directly ennobled by the emperor. The restricted sphere of administration left by Augustus to the old magistracies was still further narrowed; their jurisdiction, for example, tended to pass into the hands of the Greek officers appointed by Caesar—the prefect of the city and the prefect of the guards. The complete organization of Caesar's own administrative service, and its recognition as a state bureaucracy, was chiefly the work of Hadrian, who took the secretariats out of the hands of freedmen and entrusted them to procurators of equestrian rank. All these changes, inevitable, and in some degree beneficial, as they were, brought with them the attendant evils of excessive centralization. Though these were hardly felt while the central authority was wielded by vigorous rulers, yet even under Trajan, Hadrian and the Antonines we notice a failure of strength in the empire as a whole, and a corresponding increase of pressure on the imperial Government itself. The reforms of Augustus had given free play to powers still fresh and vigorous. The ceaseless labours of Hadrian were directed mainly to the careful husbanding of such strength as still remained, or to attempts at reviving it by the sheer force of imperial authority. Among the symptoms of incipient decline were the growing depopulation, especially of the central districts of the empire, the constant financial difficulties, the deterioration in character of the local governments in the provincial communities, and the increasing reluctance exhibited by all classes to undertake the now onerous burden of municipal office.

It is to such facts as these that we must look in passing a final judgment on the imperial Government, which is admittedly seen in its best and most perfect form in the Antonine period. In our review of the conditions which brought about the fall of the Roman republic, we saw that the collapse of the city-state made

Caesarism inevitable, since the extension of federal and representative institutions to a heterogeneous world-empire was out of the question. The benefits which Caesarism conferred upon mankind are plain. In the first place, the Roman world, which had hitherto not been governed in the true sense of the word, but exploited in the interests of a dominant clique, now received an orderly and efficient government, under which the frightful ravages of misrule and civil strife were repaired. The financial resources of the empire were husbanded by skilled and, above all *trained* administrators, to whom the imperial service offered a *carrière ouverte aux talents*; many of these were Greeks, or half-Greek Orientals, whose business capacity formed an invaluable asset hitherto neglected. Augustus caused an official survey of the empire to be made, and a scientific census of its resources was gradually carried out and from time to time revised; thus the balance of revenue and expenditure could be accurately estimated and adjusted, and financial stability was established. The system of tax-farming was gradually abolished and direct collection substituted; commerce was freed from vexatious restrictions, and large customs-districts were formed, on whose borders duties were levied for revenue only. The Government took even more direct measures for the encouragement of industry and especially of agriculture. The most remarkable of these were the "alimentary" institutions, originally due to Nerva and developed by succeeding emperors. Capital was advanced at moderate rates of interest to Italian landowners on the security of their estates, and the profits of this system of land banks were devoted to the maintenance and education of poor children. The foundation of colonies for time-expired soldiers, who received grants of land on their discharge, contributed something to the formation of a well-to-do agricultural class; and although the system was not successful in lower Italy, where economic decline could not be arrested, there can be no doubt that central and northern Italy, where the vine and olive were largely cultivated, and manufacturing industries sprang up, enjoyed a considerable measure of prosperity. The extension of the Roman municipal system to the provinces, and the watchful care exercised by the imperial Government over the communities, together with the profuse liberality of the emperors, which was imitated by the wealthier citizens of the towns, led to the creation of a flourishing municipal life still evidenced by the remains which in districts such as Asia Minor or Tunis stand in significant contrast with the desolation which was brought about by centuries of barbaric rule. Mommsen¹ has, indeed, expressed the opinion that "if an angel of the Lord were to strike the balance whether the domain ruled by Antoninus were governed with the greater intelligence and the greater humanity at that time or in the present day, whether civilization and national prosperity generally had since that time advanced or retrograded, it is very doubtful whether the decision would prove in favour of the present."

But there is another side to the picture. During the last two centuries of the republic Rome, by introducing slaves and captives to perform the hard labour of Italy while the free population spent itself in war or lost itself in the provinces, had thoroughly changed the Italian stock. Had the change come gradually and had Rome received the newcomers into schools that might have trained them into a consistent tradition this introduction of a varied stock might perhaps have enriched the spirit of Rome. But this was not to be. Such an amalgam requires time to eliminate the products of incongruous physical mixture,² to unify the peoples of a dozen languages until they can comprehend each other and effectually shape common ideals, to distil and throw off the hatred, servility and unsocial hostility to the community bred by years of suffering in slavery, and in a word to create a new people homogeneous enough to act together. The invasion was so rapid and the time so short that such a process of unification never completed itself at Rome. And when Rome, which was the heart of the empire, lost its rhythm and balance, when Rome no longer had a definite culture, a certain inspiration to impart to the provinces, when Rome's religion suc-

¹Provinces, i. p. 5.

²M. P. Nilsson, in *Hereditas* (1921), 370.

cumbed to the several mystical cults brought in by her slaves, when her moral standards yielded before a dozen incongruous traditions, and her literature lost itself in blind gropings after a bygone tradition of a freer day, the provincials in despair abandoned her guidance.

Furthermore, the empire brought into being in the provinces a new nationality, due to the partial fusion of Roman ideas with Hellenic culture, besides which other elements, saving only, as we shall see, those contributed by the Oriental religions, were insignificant. This new nationality grew in definition through the gradual disappearance of distinctions of language and manners, the assimilating influence of commercial and social intercourse, and the extinction of national jealousies and aspirations. But the cosmopolitan society thus formed was compacted of so many disparate elements that a common patriotism was hard to foster, and doubly hard when the autocratic system of government prevented men from aspiring to that true political distinction which is attainable only in a self-governing community. It is true that there was much good work to be done, and that much good work was done, in the service of the emperors; true, also, that the *carrière ouverte aux talents* was in large measure realized. Distinctions of race were slowly but steadily effaced by the grant of citizen rights to provincials and by the manumission of slaves; and the career open to the romanized provincial or the liberated slave might culminate in the highest distinctions which the emperor could bestow. In the hierarchy of social orders—senate, *equites* and *plebs*—ascent was easy and regular from the lower grade to the higher; and the more enlightened of the emperors—especially Hadrian—made a genuine endeavour to give a due share in the work of government to the various subject races. But nothing could compensate for the lack of self-determination, and although during the first century and a half of imperial rule a flourishing local patriotism in some degree filled the place of the wider sentiment, this gradually sank into decay and became a pretext under cover of which the lower classes in the several communities took toll of their wealthier fellow-citizens in the shape of public works, largesses, amusements, etc., until the resources at the disposal of the rich ran dry, the communities themselves in many cases became insolvent, and the inexorable claims of the central Government were satisfied only by the surrender of financial control to an imperial commissioner. Then the organs of civic life became atrophied, political interest died out, and the whole burden of administration, as well as that of defence, fell upon the shoulders of the bureaucracy, which proved unequal to the task.

The Empire, 180-284.—Marcus Aurelius died in 180, and the reign of his worthless son, Commodus (A.D. 180-192), was followed by a century of war and disorder, during which nothing but the stern rule of soldier emperors saved the empire from dissolution. The first and ablest of these was Septimius Severus (193-211), whose claims were disputed by Clodius Albinus in the West, and by Pescennius Niger in the East; in these struggles rival Roman forces, for the first time since the accession of Vespasian, exhausted each other in civil war. Severus emphasized strongly the military character of the principate; he abstained from seeking confirmation for his authority from the senate, and deprived that body of most of the share in the government which it still retained; he assumed the title of proconsul in Rome itself, made the prefect of the guard the viceroy of his authority, and heaped privileges upon the army, which, although they secured its entire devotion to his family, impaired its efficiency as a fighting force and thus weakened Rome in face of the barbarian invader. He succeeded in founding a short-lived dynasty, which ended with the attempt of the virtuous but weak Alexander (222-235) to restore the independence of the senate. This led to a military reaction, and the elevation of the brutal Maximinus, a Thracian peasant, to the throne. The disintegration of the empire was the natural result; for the various provincial armies put forward their commanders as claimants to the purple. These "tyrants," as they were called when unsuccessful, sprang up in ever-increasing numbers, and weakened Rome's power of resistance to the new enemies who were threatening her frontiers—

the Alamanni and Franks, who broke through the German *limes* in 236; the Goths, who crossed the Danube in 247, raided the Balkan provinces, and defeated and slew the emperor, Decius, in 251, and the restored Persian kingdom of the Sassanidae (*see PERSIA*), whose rulers laid claim to all the Asiatic possessions of Rome and in 260 captured Antioch and made the emperor, Valerian, a prisoner. During the reign of Gallienus, the son of Valerian (260-268), the evil reached its height. The central authority was paralysed; the romanized districts beyond the Rhine were irrevocably lost; the Persians were threatening to overrun the eastern provinces; the Goths had formed a fleet of 500 sail which harried Asia Minor and even Greece itself, where Athens, Corinth, Sparta and Argos were sacked; and the legions on the frontiers were left to repel the enemies of Rome as best they could. A provincial empire was established by M. Cassianus Latinus Postumus in Gaul and maintained by his successors, M. Piavonius Victorinus and C. Pius Esuvius Tetricus. Their authority was acknowledged, not only in Gaul and by the troops on the Rhine, but by the legions of Britain and Spain; and under Postumus at any rate (259-269) the existence of the Gallic empire was justified by the repulse of the barbarians and by the restoration of peace and security to the provinces of Gaul. On the Danube, in Greece and in Asia Minor none of the "pretenders" enjoyed more than a passing success. In the Far East, the Syrian Odaenathus, prince of Palmyra (q.v.), though officially only the governor of the East (*dux Orientis*) under Gallienus, drove the Persians out of Asia Minor and Syria, recovered Mesopotamia, and ruled Syria, Arabia, Armenia, Cappadocia and Cilicia with all the independence of a sovereign. Odaenathus was murdered in 266. His young son Vaballathus (Wahab-allath) succeeded him in his titles, but the real power was vested in his widow Zenobia, under whom, not only the greater part of Asia Minor but even the province of Egypt was forcibly added to the dominions governed by the Palmyrene prince, who ceased to acknowledge the supremacy of Rome.

Gallienus was murdered at Milan in 268, and after the brief reign of Claudius II. (A.D. 268-270), who checked the advance of the Goths, Aurelian (270-275) restored unity to the distracted empire. Palmyra was destroyed and Zenobia led a prisoner to Rome (273) and in the next year the Gallic empire came to an end by the surrender of Tetricus. Aurelian, it is true, abandoned the province of Dacia, but the defences of the Danube were strengthened, and in 276 Probus repulsed the Franks and Alamanni, who had been pressing on the Rhine frontier for some 40 years. Finally, Carus (282) recovered Armenia and Mesopotamia from the Persians and restored the frontier fixed by Septimius Severus.

The Empire at the Close of the 3rd Century.—Although any serious loss of territory had been avoided, the storms of the 3rd century had told with fatal effect upon the general condition of the empire. The "Roman peace" had vanished; not only the frontier territories, but the central districts of Greece, Asia Minor, and even Italy itself, had suffered from the ravages of war, and the fortification of Rome by Aurelian was a significant testimony to the altered condition of affairs. War, plague and famine had thinned the population and crippled the resources of the provinces. On all sides land was running waste, cities and towns were decaying and commerce was paralysed. Only with the greatest difficulty were sufficient funds squeezed from the exhausted taxpayers to meet the increasing cost of the defence of the frontiers. The old established culture and civilization of the Mediterranean world rapidly declined, and the mixture of barbaric rudeness with Oriental pomp and luxury which marked the court, even of the better emperors, such as Aurelian, was typical of the general deterioration, which was accelerated by the growing practice of settling barbarians on lands within the empire and of admitting them freely to service in the Roman army.

Period II: The Dominate, A.D. 284-476. (a) **From the Accession of Diocletian to the Death of Theodosius (A.D. 284-395).**—The work of fortifying the empire alike against internal sedition and foreign invasion, begun by Aurelian and Probus, was completed by Diocletian and Constantine the Great,

whose system of government, novel as it appears at first sight, was in reality the natural and inevitable outcome of the history of the previous century. Its object was two-fold, to give increased stability to the imperial authority itself and to organize efficient administrative machinery throughout the empire. In the second year of his reign Diocletian associated Maximian with himself as colleague, and six years later (293) the hands of the two "Augusti" were further strengthened by the proclamation of Constantius and Galerius as "Caesars." Precedents for such an arrangement were to be found in the earlier history of the principate, and it divided the burdens and responsibilities of government without sacrificing the unity of the empire; for, although to each of the Augusti and Caesars a separate sphere was assigned, the Caesars were subordinate to the higher authority of the Augusti, and over all his three colleagues Diocletian claimed to exercise a paramount control. It also reduced the risk of a disputed succession by establishing in the two Caesars the natural successors to the Augusti, and it satisfied the jealous pride of the rival armies by giving them *imperial powers* of their own. The distribution of power between Diocletian and his colleagues followed those lines of division which the feuds of the previous century had marked out. The armies of the Rhine, the Danube and of Syria fell to the lot respectively of Constantius, Galerius and Diocletian, the central districts of Italy and Africa to Maximian.

Diocletian's Reforms.—In the new system the imperial authority was finally emancipated from all constitutional limitation and control and the last traces of its republican origin disappeared. The emperors from Diocletian onwards were autocrats in theory as well as in practice. This avowed despotism Diocletian, following in the steps of Aurelian, hedged round with all the pomp and majesty of Oriental monarchy. The final adoption of the title *dominus*, the diadem on the head, the robes of silk and gold, the replacement of the republican salutation of a fellow-citizen by the adoring prostration even of the highest in rank before their lord and master, were all significant marks of the new regime. In the hands of this absolute ruler was placed the entire control of an elaborate administrative machinery. Most of the old local and national distinctions, privileges and liberties which had once flourished within the empire had already disappeared under the leveling influence of imperial rule, and the process was now completed. Roman citizenship had, since the edict of Caracalla, ceased to be the privilege of a minority. Diocletian finally reduced Italy and Rome to the level of the provinces: the provincial land-tax and provincial government were introduced into Italy, while Rome ceased to be even in name the seat of imperial authority. Throughout the whole area of the empire a uniform system of administration was established, the control of which was centred in the imperial palace. Between the civil and military departments the separation was complete. At the head of the former were the praetorian prefects, next below them the *vicarii*, who had charge of the *dioceses*; below these again the governors of the separate provinces (*praesides, correctores, consulares*), under each of whom was a host of minor officials. Parallel with this civil hierarchy was the series of military officers, from the *magistri militum*, the *duces* and *comites* downwards. In both there is the utmost possible subordination and division of authority. The subdivision of provinces, begun by the emperors of the 2nd century, was systematically carried out by Diocletian, and each official, civil or military, was placed directly under the orders of a superior; thus a continuous chain of authority connected the emperor with the meanest official in his service. Finally, the various grades in these two imperial services were carefully marked by the appropriation to each of distinctive titles, the highest being that of *illustris*, which was confined to the prefects and to the military *magistri* and *comites*, and to the chief ministers.

There can be little doubt that on the whole these reforms prolonged the existence of the empire, by creating a machinery which enabled the stronger emperors to utilize effectively all its available resources, and which even to some extent made good the deficiencies

of weaker rulers. But in many points they failed to attain their object. Diocletian's division of the imperial authority among colleagues, subject to the general control of the senior Augustus, was effectively discredited by the 20 years of almost constant conflict which followed his own abdication (305-323). Constantine's partition of the empire among his three sons was not more successful in ensuring tranquillity, and in the final division of the East and West between Valens and Valentinian (364) the essential principle of Diocletian's scheme, the maintenance of a single central authority, was abandoned. The "tyrants" the curse of the 3rd century, were far from unknown in the 4th. The system, moreover, while it failed altogether to remove some of the existing evils, aggravated others. The already overburdened financial resources of the empire were strained still further by the increased expenditure necessitated by the substitution of four imperial courts for one, and by the multiplication in every direction of paid officials. The gigantic bureaucracy of the 4th century proved, in spite of its undoubted services, an intolerable weight upon the energies of the empire.

The Division of the Empire.—Diocletian and Maximian formally abdicated their high office in 305. Nineteen years later Constantine I. the Great, the sole survivor of six rival emperors, united the whole empire under his own rule. His reign of 14 years was marked by two events of first-rate importance—the recognition of Christianity as the religion of the empire and the building of the new capital at Byzantium. The alliance which Constantine inaugurated between the Christian Church and the imperial Government, while it enlisted on the side of the State one of the most powerful of the new forces with which it had to reckon, imposed a check, which was in time to become a powerful one, on the imperial authority. The establishment of the new "City of Constantine" as a second Rome paved the way for the final separation of East and West by providing the former for the first time with a suitable seat of government on the Bosphorus. The death of Constantine in 337 was followed, as the abdication of Diocletian had been, by the outbreak of quarrels among rival Caesars. Of the three sons of Constantine who in 337 divided the empire between them, Constantine the eldest fell in civil war against his brother Constans; Constans himself was, ten years afterwards, defeated and slain by Magnentius; and the latter in his turn was in 353 vanquished by Constantine's only surviving son Constantius. Thus for the second time the whole empire was united under the rule of a member of the house of Constantine. But in 355 Constantius granted the title of Caesar to his cousin Julian and placed him in charge of Gaul, where the momentary elevation of a tyrant, Silvanus, and still more the inroads of Franks and Alamanni, had excited alarm. But Julian's successes during the next five years were such as to arouse the jealous fears of Constantius. In order to weaken his suspected rival the legions under Julian in Gaul were suddenly ordered to march eastward against the Persians (360). They refused; and when the order was repeated, replied by proclaiming Julian himself emperor and Augustus. Julian, with probably sincere reluctance, accepted the position, but the death of Constantius in 361 saved the empire from the threatened civil war. Julian's attempted restoration of pagan and in especial of Hellenic worship had no more permanent effect than the war which he courageously waged against the multitudinous abuses which had grown up in the luxurious court of Constantius. But his vigorous administration in Gaul undoubtedly checked the barbarian advance across the Rhine, and postponed the loss of the western provinces; on the contrary, his campaign in Persia, brilliantly successful at first, ended in his own death (363), and his successor, Jovian, immediately surrendered the territories beyond the Tigris won by Diocletian 70 years before. Jovian died on Feb. 17, 364; and on Feb. 26, Valentinian was acknowledged as emperor of the army at Nicea. In obedience to the wish of the soldiers that he should associate a colleague with himself, he conferred the title of Augustus upon his brother Valens, and the division of the empire was at last effected—Valentinian became emperor of the West, Valens of the East. Valentinian maintained the integrity of the empire until his death (in 375), which deprived the weaker Valens of a trusted

¹The seats of government for Diocletian and his three colleagues were Nicomedia, Mediolanum, Augusta Treverorum, and Sirmium.

counsellor and ally, and was followed by a serious crisis on the Danube. In 376 the Goths, hard pressed by their new foes from the eastward, the Huns, sought and obtained the protection of the Roman empire. They were transported across the Danube and settled in Moesia, but, indignant at the treatment they received, they rose in arms against their protectors. In 378 at Adrianople Valens was defeated and killed, and the victorious Goths advanced eastwards to the very walls of Constantinople. Once more, however, the danger passed away. The skill and tact of Theodosius, who had been proclaimed emperor of the East by Gratian, conciliated the Goths; they were granted an allowance, and in large numbers entered the service of the Roman emperor. The remaining years of Theodosius's reign (382-395) were mainly engrossed by the duty of upholding the increasingly feeble authority of his western colleague against the attacks of pretenders. Maximus, the murderer of Gratian (383), was at first recognized by Theodosius as Caesar, and left in undisturbed command of Gaul, Spain and Britain; but, when in 386 he proceeded to oust Valentinian II. from Italy and Africa, Theodosius marched westwards, crushed him and installed Valentinian as emperor of the West. In the very next year, however, the murder of Valentinian (392) by Arbogast, a Frank, was followed by the appearance of a fresh tyrant in the person of Eugenius, a domestic officer and nominee of Arbogast himself. Once more Theodosius marched westwards, and near Aquileia decisively defeated his opponents. But his victory was quickly followed by his own illness and death (395), and the fortunes of East and West passed into the care of his two sons Arcadius and Honorius.

(b) *From the Death of Theodosius to the Extinction of the Western Empire (395-476).*—Through more than a century from the accession of Diocletian the Roman empire had succeeded in holding at bay the swarming hordes of barbarians. But, though no province had yet been lost, as Dacia had been lost in the century before, and though the frontier lines of the Rhine and the Danube were still guarded by Roman forts and troops, there were signs in plenty that a catastrophe was at hand.

From all the writers who deal with the 4th century we have one long series of laments over the depression and misery of the provinces.¹ To meet the increased expenditure necessary to maintain the legions, to pay the hosts of officials and to keep up the luxurious splendour of the imperial courts, not only were the taxes raised in amount but the most oppressive and inquisitorial methods were adopted in order to secure for the imperial treasury every penny that could be wrung from the wretched taxpayer. The results are seen in such pictures as that which the panegyrist Eumenius draws of the state of Gaul (306-312) under Constantine, in the accounts of the same province under Julian 50 years later, in those given by Zosimus early in the 5th century, and in the stringent regulations of the Theodosian code, dealing with the assessment and collection of the taxes. Among the graver symptoms of economic ruin were the decrease of population, which seriously diminished not only the number of taxpayers, but the supply of soldiers for the legions; the spread of infanticide; the increase of waste lands whose owners and cultivators had fled to escape the tax collector; the declining prosperity of the towns; and the constantly recurring riots and insurrections, both among starving peasants, as in Gaul, and in populous cities like Antioch. The distress was aggravated by the civil wars, by the rapacity of tyrants, such as Maximian and Maximus, but above all by the raids of the barbarians, who seized every opportunity afforded by the dissensions or incapacity of the emperors to cross the frontiers and harry the lands of the provincials. Constantine (306-312), Julian (356-360) and Valentinian I. (364-375) had each to give a temporary breathing-space to Gaul by repelling the Franks and Alamanni. Britain was harassed by Picts and Scots from the north (367-370), while the Saxon pirates swept the northern seas and the coasts both of Britain and Gaul. On the Danube the Quadi, Sarmatae, and above all the Goths, poured at intervals into the provinces of Pannonia and Moesia, and penetrated to Macedon and Thrace. In the East, in addition to the

constant border feud with Persia, we hear of ravages by the Isaurian mountaineers, and by a new enemy, the Saracens.

Even more ominous of coming danger was the extent to which the European half of the empire was becoming barbarized. The policy which had been inaugurated by Augustus himself of settling barbarians within the frontiers had been taken up on a larger scale and in a more systematic way by the Illyrian emperors of the 3rd century, and was continued by their successors in the 4th. In Gaul, in the provinces south of the Danube, even in Macedon and Italy, large barbarian settlements had been made—Theodosius in particular distinguishing himself by his liberality in this respect. Nor did the barbarians admitted during the 4th century merely swell the class of half-servile *coloni*. On the contrary, they not only constituted to an increasing extent the strength of the imperial forces, but won their way in ever-growing numbers to posts of dignity and importance in the imperial service. Under Constantine the palace was crowded with Franks. Julian led Gothic troops against Persia, and the army with which Theodosius defeated the tyrant Maximus (388) contained large numbers of Huns and Alans, as well as of Goths. The names of Arbogast, Stilicho and Rufinus are sufficient proof of the place held by barbarians near the emperor's person and in the control of the provinces and legions of Rome; and the relations of Arbogast to his nominee for the purple, Eugenius, were an anticipation of those which existed between Ricimer and the emperors of the latter half of the 5th century.

Barbaric Invasions.—It was by barbarians already settled within the empire that the first of the series of attacks which finally separated the western provinces from the empire and set up a barbaric ruler in Italy was made, and it was in men of barbarian birth that Rome found her ablest and most successful defenders. The Visigoths whom Alaric led into Italy had been settled south of the Danube as allies of the empire since the accession of Theodosius. But, like the Germans of the days of Caesar, they wanted land for their own, and Alaric aspired to raise himself to the heights which had been reached before him by the Vandal Stilicho at Ravenna and the Goth Rufinus at Constantinople. The jealousy which existed between the rulers of the western and eastern empires furthered his plans. In the name of Arcadius, the emperor of the East, or at least with the connivance of Arcadius's minister Rufinus, he occupied the province of Illyricum, and from thence ravaged Greece, which, according to the existing division of provinces, belonged to the western empire. Thence in 396 he retreated before Stilicho to Illyricum, with the command of which he was now formally invested by Arcadius; he thus gained a base of operations against Italy. In 400 he led his people, with their wives and families, their wagons and treasure, to seek lands for themselves south of the Alps. But in this first invasion he penetrated no farther than the plains of Lombardy, and after the desperate battle of Pollentia (402 or 403) he slowly withdrew from Italy, his retreat being hastened by the promises of gold freely made to him by the imperial Government. Not until the autumn of 408 did Alaric again cross the Alps. Stilicho was dead; the barbarian troops in Honorius's service had been provoked into joining Alaric by the anti-Teutonic policy of Honorius and his ministers, and Alaric marched unopposed to Rome. The payment of a heavy ransom, however, saved the city. Negotiations followed between Alaric and the court of Ravenna. Alaric's demands were moderate, but Honorius would grant neither lands for his people nor the honourable post in the imperial service which he asked for himself. Once more Alaric sat down before Rome, and the citizens were forced to agree to his terms. Attalus, a Greek, the prefect of the city, was declared Augustus, and Alaric accepted the post of commander-in-chief. But after a few months Alaric formally deposed Attalus, on account of his incapacity, and renewed his offers to Honorius. Again they were declined, and Alaric marched to the siege and sack of Rome (410). His death followed hard on his capture of Rome. Two years later (412) his successor Ataulf led the Visigoths to find in Gaul the lands which Alaric had sought in Italy. It is characteristic of the anarchical condition of the West that Ataulf and his Goths should have fought for Honorius in Gaul

¹ Eumenius, *Soliloquy*, and *De Constantino*, *De Roma*, ch. 10.

against the tyrants and in Spain against the Vandals, Suebi and Alani; and it was with the consent of Honorius that in 419 Wallia, who had followed Ataulf as king of the Visigoths, finally settled with his people in south-western Gaul and founded the Visigothic monarchy.

It was about the same period that the accomplished fact of the division of Spain between the three barbarian tribes of Vandals, Suebi and Alani was in a similar manner recognized by the paramount authority of the emperor of the West. These peoples had crossed the Rhine at the time when Alaric was making his first attempt on Italy. A portion of the host led by Radagaisus actually invaded Italy, but was cut to pieces by Stilicho near Florence (405); the rest pressed on through Gaul, crossed the Pyrenees, and entered the as yet untouched province of Spain.

Honorius died in 423. With the single exception of Britain,¹ no province had yet formally broken loose from the empire. But over a great part of the West the authority of the emperors was now little more than nominal; throughout the major part of Gaul and in Spain the barbarians had settled, and barbarian states were growing up which recognized the supremacy of the emperor, but were in all essentials independent of his control.

The long reign of Valentinian III. (425-455) is marked by two events of first-rate importance—the conquest of Africa by the Vandals² and the invasion of Gaul and Italy by Attila. The Vandal settlement in Africa was closely akin in its origin and results to those of the Visigoths and of the Vandals themselves in Gaul and Spain. Here, as there, the occasion was given by the jealous quarrels of powerful imperial ministers. The feud between Boniface, count of Africa, and Aëtius, the “master-general” or “count of Italy,” opened the way to Africa for the Vandal king Gaiseric (Genseric), as that between Stilicho and Rufinus had before set Alaric in motion westwards, and as the quarrel between the tyrant Constantine and the ministers of Honorius had paved the way for the Vandals, Suebi and Alani into Spain. In this case, too, land-hunger was the impelling motive with the barbarian invader, and in Africa, as in Gaul and Spain, the invaders’ acquisitions were confirmed by the imperial authority which they still professed to recognize. In 429 Gaiseric, king of the Vandals, crossed with his warriors, their families and goods, to the province of Africa, hitherto almost untouched by the ravages of war. Thanks to the quarrels of Boniface and Aëtius, their task was an easy one. The province was quickly overrun. In 435 a formal treaty secured them in the possession of a large portion of the rich lands which were the granary of Rome, in exchange for a payment probably of corn and oil. Carthage was taken in 439, and in the following year the Vandal kingdom was firmly established over a wide area in the ancient Roman realm.

Eleven years later (451) Attila invaded Gaul, but this Hunnish movement was in a variety of ways different from those of the Visigoths and Vandals. Nearly a century had passed since the Huns first appeared in Europe and drove the Goths to seek shelter within the Roman lines. Attila was now the ruler of a great empire in central and northern Europe and, in addition to his own Huns, the German tribes along the Rhine and Danube and far away to the north owned him as king. He confronted the Roman power as an equal; and, unlike the Gothic and Vandal chieftains, he treated with the emperors of East and West as an independent sovereign. His advance on Gaul and Italy threatened, not the establishment of one more barbaric chieftain on Roman soil, but the subjugation of the civilized and Christian West to the rule of a heathen and semi-barbaric conqueror. But the Visigoths in Gaul, Christian and already half romanized, rallied to the aid of the empire against a common foe. Attila, defeated at Châlons by Aëtius, withdrew into Pannonia (451). In the next year he overran Lombardy, but penetrated no farther south, and in 453 he died. With the murder of Valentinian III. (455) the western branch of the house of Theodosius came to an end, and

the next 20 years witnessed the accession and deposition of nine emperors.

The End.—Under the three months’ rule of Maximus, the Vandals under Gaiseric invaded Italy and sacked Rome. From 456-472 the actual ruler of Italy was Ricimer, the Suebe. Of the four emperors whom he placed on the throne, Majorian (457-461) alone played any imperial part outside Italy. Ricimer died in 472, and two years later a Pannonian, Orestes, attempted to fill his place. He deposed Julius Nepos and proclaimed as Augustus his own son Romulus. But the barbarian mercenaries in Italy determined to secure for themselves a position there such as that which their kinsfolk had won in Gaul and Spain and Africa. Their demand for a third of the lands of Italy was refused by Orestes, and they instantly rose in revolt. On the defeat and death of Orestes they proclaimed their leader, Odoacer the Rugian, king of Italy. Romulus Augustulus laid down his imperial dignity, and the court at Constantinople was informed that there was no longer an emperor of the West.

The installation of a barbarian king in Italy was the natural climax of the changes which had been taking place in the West throughout the fifth century. In Spain, Gaul and Africa barbarian chieftains were already established as kings. In Italy, for the last 20 years, the real power had been wielded by a barbarian officer. Odoacer, when he decided to dispense with the nominal authority of an emperor of the West, placed Italy on the same level of independence with the neighbouring provinces. But the old ties with Rome were not severed. The new king of Italy formally recognized the supremacy of the one Roman emperor at Constantinople, and was invested in return with the rank of “patrician,” which had been held before him by Aëtius and Ricimer. In Italy too, as in Spain and Gaul, the laws, the administrative system and the language remained Roman. But the emancipation of Italy and the western provinces from direct imperial control, which is signalized by Odoacer’s accession, has rightly been regarded as marking the opening of a new epoch. It made possible in the West the development of a Romano-German civilization; it facilitated the growth of new and distinct states and nationalities; it gave a new impulse to the influence of the Christian Church and laid the foundations of the power of the bishops of Rome.

CHRONOLOGICAL TABLE OF THE ROMAN EMPERORS

B.C.	A.D.

For subsequent events see ROMAN EMPIRE, LATER.

BIBLIOGRAPHY.—I. REPUBLICAN PERIOD: Ancient Sources. No history of Rome was written till Fabius Pictor issued his *Annales* about 200 B.C. His sources were inscribed laws, treaties and *senatus consulta*, a great many of which had been preserved; the *Annales* priestly records of important events requiring thank-offerings and atonements—tablets that contained the lists of magistrates from the early republic—family records that did not go far back, some inscriptions on public buildings, some records of early colonies and oral tradition. Recent excavations indicate that the substructure of history which he gave from the early republic is fairly sound. But the traditional account of the regal period must be considered legendary, as indeed the Roman historians assumed that it was. The early historians, Fabius, Cincius, Aclius and Postumius, were all statesmen who seem to have written with a keen sense of responsibility. Those who followed, Cato the Elder, Calpurnius Piso, Cassius Hemina, Tuditans and Fannius (who wrote of the Gracchan period), were also well informed, and wrote chiefly regarding contemporary events. At the same time the Greek statesman, Polybius, wrote an accurate history from the time of the first Punic War, valuable portions of which have survived. After the Gracchi, historians like Gnaeus Gellius began to insert family legends into the dry annals of the early period and he was followed by diffuse and rhetorical writers like Claudius Quadrigarius and Valerius Antias who composed popular accounts with little regard for accuracy. During the same period numerous apologetic autobiographies, memoirs and political pamphlets appeared which unduly coloured later accounts of Rome. Of all that we have mentioned (except Polybius) only brief fragments are extant, but the substance of all these books went into later histories that have survived. We have two valuable pamphlets of the amateur historian Sallust, the excellent commentaries of Julius Caesar (*q.v.*), the exceedingly important correspondence of Cicero (*q.v.*) as well as many of his speeches. In the Ciceronian period much valuable antiquarian work was done by men like Varro, Pomponius Atticus, and others which aided later writers to correct the mistakes of their predecessors.

In the Augustan age the materials accumulated by previous generations were worked up by compilers whose works are in some cases preserved. The work of Livy (*q.v.*) covered the history of Rome from its foundation to 9 B.C. in 142 books; of these only 35 are preserved in their entirety, while the contents of the rest are known in outline from an epitome (*periochae*) and from the compendia of Florus and later authors. Diodorus Siculus (*q.v.*) of Agrigum in Sicily followed the earlier annalists in the sections of his *Universal History* (down to Caesar) which dealt with Roman affairs; Dionysius Halicarnassensis (*q.v.*), in his *Roman Archaeology* (published in 7 B.C.), treated early Roman history in a more ambitious and rhetorical style, with greater fullness than Livy, whose work he seems to have used. Universal histories were also written in the Augustan age by Trogus Pompeius, whose work is known to us from the epitome of Justin (2nd century A.D.), and Juba, the learned king of Mauretania. Strabo (*q.v.*), whose *Geography* is extant, was the author of a continuation of Polybius's history (to 27 B.C.). The learning of the time was enshrined in the encyclopaedia of Verrius Flaccus, of which we possess part of Festus's abridgement (2nd century A.D.), together with an epitome of Festus by Paulus Diaconus (10th c., Charlemagne). An official list of the consuls and other chief magistrates of the republic was inscribed on the walls of the Regia (rebuilt 36 B.C.), followed somewhat later by a similar list of *triumphatores*; the former of these is known as the *Fastii Capitolini* (C.I.L.I.7.1. sqq.), since the fragments which have been recovered are preserved in the palace of the Conservatori on the Capitol.

Among writers of the imperial period who dealt with republican history the most important are Velleius Paterculus, whose compendium of Roman history was published in A.D. 30; Plutarch (c. A.D. 45-115), in whose biographies much contemporary material was

worked up; Appian, who wrote under the Antonines and described the wars of the republic under geographical headings (partly preserved) and the civil wars in five books, and Dio Cassius (*v. infra*), of whose history only that portion which deals with events from 69 B.C. onwards is extant.

The evidence of inscriptions (*q.v.*) and coins (see NUMISMATICS) begins to be of value during the last 150 years of the republic. A series of laws and *Senatus consulta* (beginning with the *Senatus consultum de Bacchanabais*, 189 B.C.) throws light on constitutional questions, while the coins struck from about 150 B.C. onwards bear types illustrative of the traditions preserved by the families to which the masters of the mint (*primarii monetales*) belonged.

MODERN AUTHORITIES.—The criticism of early Roman history begins with Giambattista Vico, 1725, and Louis de Beaufort, 1738, Niebuhr (1811-11) and Schweigler (1853-58) laid a sound foundation for the historical reconstruction of Theodore Mommsen, whose great history appeared in 1854-56. In Roman constitutional history Mommsen's *Staatsrecht* (1st ed. 1877-75) has not been superseded, though Lange's *Römische Alterthümer* (1856-71) is still serviceable. The soundest modern history of republican Rome (incomplete) is De Sanctis, *Storia dei Romani* (1907-). Heitland's *Roman Republic* (3 vols., 1909) is a fresh and independent work. Groeche's recent revision of Drumann is of value for its accumulation of references for the later period. Other briefer histories devoted to special topics are Greenidge, *History of Rome* vol. I. (for the Gracchan period); several volumes of Pals chiefly concerned with criticism; E. Meyer, *Cassius Monarchie und der Principat des Pompeius*; Homo, *L'Épique Primitive*; Holleaux, *Rome, la Grèce*; Beloch, *Römische Geschichte*; Holmes, *The Roman Republic* (chiefly military history of the late republic); Rostovtzeff, *Rome; Frank, Roman Imperialism and An Economic History of Rome*; and finally the chapters devoted to Rome in volumes vii.-ix. of the *Cambridge Ancient History*. (See VICO, GIOVANNI BATTISTA.)

II. IMPERIAL PERIOD: Ancient Sources.—The memoirs of Augustus as well as those of his contemporaries (Messalla, Agrippa, Maecenas, etc.) and successors (Tiberius, Agrippina the younger, etc.) have perished, but we possess the *Res gestae divi Augusti* inscribed on the walls of his temple at Ancyra (ed. Mommsen, 1883; Ramsay and Premerstein's *Mon. Antiochenum*, 1927, includes the fragments recently found at Antioch). Aufidius Bassus wrote the history of the civil wars and early empire, perhaps to A.D. 49, and this was continued by the elder *Justin* (A.D. 31) in 31 books, probably the last of the Vespasianic period. The works and other writings of Cornelius Tacitus (*q.v.*), whose *Annals* (properly called *ab excessu divi Augusti*) and *Histories*, carried the story of the empire down to A.D. 96. Pliny's correspondence with Trajan about the affairs of Bithynia, which he administered in A.D. 111-113, is of great historical value. Suetonius (*q.v.*), wrote the lives of the most secretaries of state to Hadrian, the biographies of the emperors from Julius Caesar to Domitian. Arianus a Bithynian Greek, wrote on Rome's policy and wars in the East. Appian (*v. supra*) dealt with the wars waged under the early empire in the closing books of his work, which have not been preserved. Dio Cassius, a Bithynian, wrote a history of Rome to the death of Elagabalus in 80 books. We possess only epitomes and excerpts of the portion dealing with events from A.D. 46 onwards, except for parts of the 78th and 79th books, in which Dio's narrative of contemporary events is especially valuable. Herodian, a Syrian, wrote a history of the emperors from Commodus to Gordian III., which as the work of a contemporary is not without value. The *Historia Augusta* (see AUGUSTAN HISTORICAL), upon which we are obliged to rely for the history of the 3rd century A.D., consists in a series of lives of the emperors (including most of the pretenders to that title) from Hadrian to Carinus, professedly written by six authors, under Diocletian and Constantine. Modern criticism has shown that (at least in its present form) it is an unreliable compilation made in the latter half of the 4th century. The fragments of Dexippus, an Athenian who successfully defended his native town against Goths, throw much light on the barbaric invasions of the 3rd century. The most important historian of the 4th century was Ammianus Marcellinus, a native of Antioch and an officer in the imperial guard, who continued the work of Tacitus (in Latin) to the death of Valens. We possess the last 18 books of his history, which cover the years A.D. 355-378. Two compendia of imperial history pass under the name of Aurelius Victor, the *Caesares*, or lives of the emperors from Augustus to Julian, and the *Epitome de Caesaribus* (not by the same author) which goes down to Theodosius I. Similar works are the *Breviarum* of Eutropius (secretary of state under Valens) and the still more brief epitome of Festus. The primer of Julian, emperor of the rhetoricians Libanius, Themistius and Eunapius—the last named continued the history of Dexippus to A.D. 404—are of great value for the latter part of the 4th century A.D. They wrote as pagans, while the Christian version of events is given by the three orthodox historians Socrates, Sozomen and Theodoret, and the Arian Philostorgius, all of whom wrote in the 5th century. An imperial official, Zosimus, writing in the latter half of that century, gave a sketch of imperial history to A.D. 410; the latter part is valuable, being based on contemporary writings. The bishops Synesius and Palladius, who lived under Arcadius and Theodosius II., furnish valuable information as to their own times;

while the fragments of Priscus tell us much of Attila and the Hunnish invasions. Mention must also be made of the poets and letter-writers of the 4th and 5th centuries—Ausonius, Claudian, Symmachus, Paulinus of Nola, Sidonius Apollinaris, Prudentius, Meropaeus and others—from whose writings much historical information is derived. Cassiodorus, the minister of Theodoric, wrote a history of the Goths, transmitted to us in the *Historia Gothorum* of Jordanes (c. A.D. 550), which gives an account of the earlier barbaric invasions. Several chronological works were compiled in the 4th and 5th centuries. It will suffice to name the *Chronology of Eusebius* (to A.D. 324), translated by Jerome and carried down to A.D. 378, and the *Chronography of A.D. 354*, an illustrated calendar containing miscellaneous information.

The codes of law, especially the *Codex Theodosianus* (A.D. 438) and the code of Justinian, as well as the army list of the early 5th century, known as the *Notitia Dignitatum*, possess great historical value. For the inscriptions of the empire, which are of incalculable importance as showing the working of the imperial system in its details, see INSCRIPTIONS; the coins (see NUMISMATICS) also throw much light on the dark places of history in the lack of other authorities. Egyptian papyri are not only instructive as to legal, economic and administrative history, but also contribute to our general knowledge of events. (See especially Mitteis-Wilcken, *Chrestomatie*, 1912, and bibliography in Rostovtzeff, *Social and Economic History of Rome*, 1926.) The *Zeitschrift für Papyrologie und Epigraphik*, ed. by U. Wilcken, gives an account of progress in this branch of study.

MODERN AUTHORITIES.—Tillemont's *Histoire des empereurs* (6 vols., 1690-1738), supplemented by *Supplément*, 1738, and Gibbon with his *Decline and Fall of the Roman Empire* (1776-78), which has never been superseded as a history of the entire imperial period, and has been rendered adequate for the purposes of the modern reader by Prof. J. B. Bury's edition (1897-1900). The history of the empire has yet to be written in the light of recent discoveries. Mommsen's fifth volume (Eng. trans., as *Provinces of the Roman Empire*, 1886) is not a narrative, but an account of Roman culture in the various provinces. H. Schiller's *Geschichte der römischen Kaiserzeit* (1883-88) is a useful handbook. Rostovtzeff's *Social and Economic History of Rome* (1926) is very valuable for its thorough sifting of inscriptions and papyri, while Dessau's *Gesch. der römischen Kaiserzeit* (1924), two volumes of which have appeared, promises to give a good survey of political history. E. S. Jones, *The Roman Empire* (1908) and Chapot, *Le Monde romain* (1927) are brief but sound and independent. For the later period we have Seeck, *Gesch. des Untergangs der antiken Welt* (6 vols., 1897-1920), Bury's *History of the Later Roman Empire* (1889), beginning from A.D. 395, and *Constitution of the Later Empire* (1910), and T. Hodgkin's *Italy and her Invaders* (6 vols., 1880-99), which tells the story of the barbaric invasions at length. The imperial constitution is described by Mommsen in the second volume of his *Staatsrecht* (v. *supra*); divergent views will be found in Herzog's *Geschichte und System der römischen Staatsverfassung* (1884-91); the working of the imperial bureaucracy is treated by O. Hirschfeld, *Die römischen Verwaltungsbeamten* (1907). The *Prosopographia Imperii Romani*, compiled by Dessau and Klebs (1897-98), is a mine of information, as is the new edition of Pauly's *Realencyclopädie der classischen Alterthumswissenschaft* (in progress). Other useful books are: Greenidge, *Roman Public Life* (1901); Abbott and Johnson, *Municipal Administration in the Roman Empire* (1926); Dill, *Roman Society in the Last Century* (1906); Paribeni, *Traiano* (1927); Mattingly, *Roman Coins* (1928). (H. F. P.; H. S.-J.; T. F.)

MEDIAEVAL HISTORY

The history of the city of Rome during the middle ages was overshadowed by the history of the papacy. The latter has left many documents; for the city there are very few, especially for the period before the 13th century. As the foundations were so ill-defined there was opportunity for historians to theorize on what the superstructure had been; and the theories were influenced by the ideas, patriotic or otherwise biased, held in the 19th century. One favourite theory was the existence of an aristocratic republic contending against the popes until overthrown by the popular revolution in 1143, when the commune arose. Of this aristocratic republic the consuls were thought to have been the heads, and the existence and functions of the senate were much discussed. This theory was held by some of the leading historians: Hegel, Gregorovius and Villari.

These views are no longer held. Some important documents have been discovered and made accessible by publication. Halphen and others whose works are cited in the bibliography have done much to elucidate the early history. Much still remains to be done, but it is probable that the analogies drawn in the past between the history of Rome and that of the other cities in Italy are misleading. The deserted Campagna surrounding the city

checked any notable increase of trade or industry and prevented the establishment of guilds on the footing that elsewhere made them the basis and support of a commune. Moreover, the Campagna was unhealthy and ill-fitted for agriculture. The population of the city was very small. There was no strong middle class among its citizens, whose leaders were usually rude, illiterate nobles. Only slowly did the forces which were at work elsewhere in Italy penetrate into the city and cause the rise of a belated commune. What part was played by the memory of the traditions of republican Rome is a mooted question. The city was styled *respublica*; the titles senator, consul, prefect, occur repeatedly; but it is necessary to be on one's guard against drawing inferences from the long-continued or revived use of old terms.

Gothic and Byzantine Rule.—The removal of the seat of empire to Constantinople effected a radical change in the political situation of Rome, but the civil administration remained unaltered. The Gothic rule merely superimposed upon the Roman social order a Teutonic stratum that never penetrated beneath its surface. The senate, the principal magistrates, both provincial and municipal, the prefect of the city, and the Roman judges enforcing the enactments of the Roman law, were all preserved. Hence there was no visible change in the constitution of the city. The wars of Belisarius and Narses against the Goths (A.D. 535-555) caused terrible slaughter and devastation in Italy, and finally subjected her to Constantinople. In place of a Gothic king she was ruled at first by a pretorian prefect and later by an exarch (first mentioned in 584), who had his seat of government at Ravenna. The pragmatic sanction (554), promulgating the Justinian code, separated the civil from the military power, and, by conferring on the bishops the authority over the provincial and municipal government, soon led to the increase of the power of the Church.

Roman institutions were altered; but their original features were still to be traced, and no heterogeneous element had been introduced. The dawn of a new epoch can be dated from the invasion of the Lombards (568-572). Their conquest of a large portion of Italy reduced the inhabitants almost to slavery. But, in the unsubdued parts of the country—namely, in Ravenna, Rome and the maritime cities—a very different state of things prevailed. The necessity for self-defence and the distance of the empire, now too weak to render any assistance, compelled the inhabitants to depend solely on their own strength. In Rome we behold the rapid growth of the papal power and the continual increase of its political influence. Not only the superintendence but often the nomination of public functionaries and judges was in the hands of the popes. And the accession to St. Peter's chair of a man of real genius in the person of Gregory I., surnamed the Great, marked the beginning of a new era. By force of individual character this pope was the true representative of the city, the born defender of Church and State. His ecclesiastical authority, already great throughout Italy, was specially great in the Roman diocese and in southern Italy. The offerings of the faithful had endowed the Church with enormous possessions in the province of Rome, in Sicily, Sardinia, and other parts. The administration of this property assumed the shape of a small government council in Rome. The use made by the pope of his revenues greatly contributed to the increase of his moral and political authority. When the city was besieged by the Lombards and the emperor left his army unpaid, Gregory supplied the required funds and thus made resistance possible. And when the defence could be no longer maintained he alone, by the weight of his personal influence and the payment of large sums, induced the Lombards to raise the siege. He negotiated in person with Agilulf and was recognized by him as the true representative of the city.

A prefect of Rome is not mentioned between 599 and 772, and then again there is silence until the time of the Ottos. It is impossible to say whether the office was discontinued. In the later days the prefect was an official of the pope, who had taken over the care of the aqueducts and the preservation of the city walls. There is also much doubt about the existence of a senate. We know that many senators had lost their lives in the long war. The pragmatic sanction of 554 did mention the senate, but this

was the last formal recognition of it as a governing body; and, if we may trust a despairing cry of Gregory the Great, it had disappeared, or at least was reduced to a shadow.

The popes now make common cause with the people against the Lombards on the one hand and the emperor on the other. This alliance was cemented by the religious disputes of the East and the West; for Pope Gregory II. (715-731) opposed the celebrated edict of the iconoclastic emperor Leo the Isaurian, and Venice, Ravenna, the Pentapolis and Rome took up arms against the emperor and elected dukes of their own.

Duchy of Rome.—In the midst of these warlike tumults a new constitution was being set up in Rome. In 711 the *Liber Pontificalis* makes the first mention of the duchy of Rome, and we find the people struggling to elect a duke of their own. In the early days of the Byzantine rule the territory appertaining to the city was no greater than under the Roman empire; but, partly through the weakness of the government of Constantinople, and above all through the decomposition of the provinces under the Lombards, this dukedom was widely extended; its limits were always changing in accordance with the course of events. At the beginning of the 8th century it had almost the same extent, except on the north, that the papal states had in 1860-70.

In the provinces, the administrators of church lands were important personages, and exercised both judicial and political functions. It was very natural that the heads of this vast administration resident in Rome should have a still higher standing, and in fact, from the 6th century, their power increased to such an extent that in the times of the Franks they already formed a species of papal cabinet with a share and sometimes a predominance in the affairs of the republic. The pope was thus at the head of a large administrative body and, in addition, was possessed of enormous revenues. He considered himself the real representative of the Roman republic. Gregory II. (715-731) accepted in the name of the republic the submission of other cities and protested against the conquest by the Lombards of those already belonging to Rome. The empire was now powerless in Italy, while the advance of the Lombards was becoming more and more threatening; they seized Ravenna in 751, thus putting an end to the exarchate, and next marched towards Rome, which had only its own forces and the aid of neighbouring cities to rely upon. To avoid being conquered Stephen II. (752-757) appealed to Pippin, king of the Franks, and concluded an alliance with him. The pope consecrated Pippin king of the Franks and named him *patricius Romanorum*. This title was given to Pippin as defender of the Church, for the pope styled him at the same time *defensor* or *protector ecclesiarum*. And the king pledged himself not only to defend the Church but also to wrest the exarchate and the Pentapolis from the Lombards and give them to the pope. Pippin brought an army (754-755) and fulfilled his promise. The pope accepted the donation in the name of St. Peter and as the visible head of the Church. Thus in 755 central Italy broke its connection with the empire; thus was inaugurated the temporal power of the papacy.

Charles the Great.—In the years immediately succeeding the popes vacillated in their policy but it was soon apparent that their hopes must be placed on renewed aid from the Franks in order to check the constantly threatened danger from the Lombards, who were seeking to recover the territory which they had lost and also to seize Rome. Adrian I. (772-795) besought the assistance of Charlemagne, who made a descent into Italy in 773, destroyed the Lombard kingdom, and seized the iron crown. Entering Rome in 774, he confirmed the donation of Pippin. The pope was now regarded and regarded himself as master of Rome; he always spoke of Rome and the Romans as "our city," "our republic," "our people." It is true that Charlemagne held the supreme power, but this power was only occasionally exercised in Rome. The pope was most tenacious of his own authority, made vigorous protest whenever rebels fled to Charlemagne or appealed to that monarch's arbitration, and contested the supremacy of the imperial officials in Rome. Yet the pope was no absolute sovereign, nor, in the modern sense of the term, did any then exist. The Roman nobles were different from other aristocratic bodies else-

where. Their power was chiefly derived from the high offices and large grants of money and land conferred on them by the popes. Every pope aggrandized his own kindred and friends, and these were the natural and often open adversaries of the next pontiff and his favourites. Thus the Roman nobility was powerful, divided, restless, and turbulent; the pope needed the support of an effective force for his own preservation; hence the necessity of creating an empire of the West.

Leo III. (795-816) further strengthened the ties between Charlemagne and the Church by sending the former the keys of the grave of St. Peter and the banner of Rome. Charlemagne had already joined to his office of patrician the function of high justice. The pope urged him to despatch an envoy to receive the oath of fealty from the Romans. Leo had antagonized the Romans, and during a procession had been attacked and barbarously maltreated (799). He fled to Charlemagne and returned guarded by his envoys; Charlemagne himself went to Rome in Nov. 800. As there was no one authorized to try a pope, Leo was permitted to clear himself of the charges against him by taking an oath on three altars. Then, on Christmas day, in St. Peter's, before an assemblage of Roman and Frankish lords, clergy, and people, the pontiff placed the imperial crown on Charlemagne's head and all proclaimed him emperor. Thus the new emperor was accepted by the Romans and consecrated by the pope. Yet Charlemagne was not sovereign of Rome; he possessed scarcely any regalia there, and was not in command of the army.

The death of Charlemagne in 814 was the signal for a further conspiracy of the nobles against the pope, who instantly put the ringleaders to death. He was severely blamed by the new emperor Louis for this violation of the imperial prerogative, as the emperor was determined to have his power recognized in Rome, and especially to insure that his ascent must be secured for the election of a pope. To assure this he sent his son Lothair to be king of Italy, and the latter was crowned co-emperor in 823. In the following year Lothair promulgated a new constitution, to which Pope Eugenius II. (824-827) had to give his oath of adherence. The more direct power was to appertain to the pope—the supreme authority, presidency of the tribunals, and final judgment on appeal to the emperor. The new constitution also established the right of contending parties to select either the Roman or a Teutonic code for settlement of their disputes.

This is a convenient point to attempt a summary of the relations of the papacy with the City of Rome. By the donations and aid of the Franks it had become legal as well as actual ruler of the city. Charles the Great as emperor was the sovereign, but he never wished to take the place of the pope as chief of the Roman administration. The imperial *missus* of the constitution of 824 had as an associate a papal *missus*, and the two were ordered to refer all matters first to the pope; the emperor reserved a right of appeal to himself. But the power of the pope was secure only when he had outside support. At other times there was always danger that the nobles in the city would either revolt against him or, and more frequently, put in their own pope and use him for their own advantage. It must be noted, however, that the nobility as such never, before the middle of the 12th century, played a constitutional rôle in the administration of the city.

The City Officials.—The principal official was the prefect, who was the chief of police and judge in criminal matters. In civil cases he presided over the court and announced the decision, but was not himself a judge. He held his power from the pope except during periods of strife between an emperor and a pope, when the former sometimes usurped the right of appointment. Next in rank were the consuls of the Romans, or the dukes. They were nobles employed by the popes for special duties such as presiding over tribunals. Apparently the titles were applied to the same office, "duke" being used before the 11th century and "consul of the Romans" later, although in the period of transition the same man was sometimes styled both "duke" and "consul." Then there were "the seven judges," the *primicerius* and the *secundicerius*, who may be roughly described as first and under secretaries of state; the *arcarius*, or papal receiver; the *scellarius*, or cashier;

the *protoscriniarius*, who was at the head of the papal chancery; the *primus defensor*, who was the advocate of the Church and administered its possessions; and the *nomenculator*, who pleaded the cause of widows, orphans and paupers. These men were called judges, a term then used generally for officials. (For example, the *judices de militia* were military officials and not judges at all.) These seven officials had apparently been created as need arose; the *primicerius* is mentioned in the 4th century, the *protoscriniarius* not until the ninth. They gradually ceased to be chiefs of administration and by the middle of the 11th century were thought of only as civil judges. For example, the *camerarius*, or treasurer, had taken over the duties of both the *arcarius* and *sacellarius*. In addition there were other civil judges, the *judices datus*, who assisted the seven, but could not give judgment without the consent of some of "the seven ordinary judges." The latter were always members of the clergy; the *judices datus* were not. For administrative purposes the city was divided into 12 districts. These 12 had succeeded the division of the city in the 6th century into 14 districts for civil administration and seven for ecclesiastical. Just when the change was made is uncertain, but Duchesne thinks it goes back to the time of the Byzantine rule. Finally it may be noted that "senator" was merely a title of honour carrying no power except when an usurping aristocrat bore the title. These statements as to the officials are based mainly on Halphen's study, which has done so much to correct former erroneous notions. Many details are still in doubt, but in general this outline applies to the period before the rise of the commune.

The fall of the Frankish empire left all Italy a prey to anarchy and torn by faction fights. The Saracens were advancing from the south, the Hungarians from the north. Anarchy was at its climax in Rome. The aristocracy gained strength and wrested fresh privileges from the pontiffs. Early in the 10th century Theophylact, who had been an official of the Sacred palace, was the chief of the Roman nobles. He was a senator, and his wife Theodora was styled "senatrix." She and her daughter Marozia were influential, and tradition has assigned to them both greater influence and more vice than can be proved by historical data. Marozia's husband was Alberic, the marquis of Spoleto. After Theophylact, Theodora and Alberic were all dead Marozia became the leader of the noble faction, and added to her power by marrying Guy, marquis of Tuscany. The pope was imprisoned by her and soon died, possibly murdered. Marozia was supreme, and raised her son to the papacy as John XI. When on Guy's death she married King Hugh of Italy (935), a revolt against her and her new husband was led by Alberic, her son; he was successful and became the ruler of the city. Of Marozia no more is heard.

Otto the Great—Alberic, as "prince and senator of all the Romans" ruled Rome and the duchy until his death in 954. "His yoke was heavy on the Romans and on the Holy Apostolic See"; but the popes were docile and the nobles were kept in order by a stern hand. Alberic was so completely master of Rome that he may have dreamed of creating an hereditary dynasty. He gave his son the name of Octavian, and on his deathbed he made the nobles swear to elect Octavian pope at the next vacancy. The lad was then 16 years old, and the following year was elected pope with the name of John XII. His palace was the scene of scandalous license, while his public acts were those of a tyrant. He desired to be both pope and prince, but utterly failed to be either. In 960, realizing the impossibility of maintaining his power without outside aid, he sought help from Otto I. and promised him the imperial crown. Otto vowed to defend the Church, to restore her territories, to refrain from usurping the power of the pope or the republic, and was crowned on Feb. 2, 962. Otto confirmed to the pope the territories granted by the Carolingians and even enlarged them, but he also revived the constitution of 824, by which the election of a pope required the imperial confirmation, and he reserved for himself the suzerainty over the papal territory as the Carolingians had done. John XII., finding a master in the protector he had invoked, joined the discontented nobles who were conspiring against the emperor. But the latter hastened to Rome in Nov. 963, assembled the clergy, nobles and heads of the people, and made them take an oath never again to

elect a pope without his consent and that of his son. He also convoked a synod presided over by himself in St. Peter's, which judged, condemned and deposed Pope John and elected Leo VIII. (963-965), a Roman noble, in his stead. All this was done at the direct bidding of the emperor, who thus deprived the Romans of their most valued privilege, the right of choosing the pope. Moreover, Otto was hated as a foreign ruler and the clergy were resentful at the uncanonical deposition of a pope and the equally uncanonical election of a layman. On Jan. 3, 964, the Romans attacked the Vatican, where the emperor was lodged. The German knights repulsed them with much slaughter, but Otto departed in February, and John XII. returned with an army of followers and compelled the defenceless Leo VIII. to seek safety in flight. Soon afterwards Leo was deposed and excommunicated by a new synod, and many of his adherents were cruelly murdered. When on May 14, 964, John suddenly died, the Romans, amid violent struggles and tumults, elected Benedict V., and procured his consecration in spite of the emperor's veto. Otto appeared at the head of an army, besieged the city, reduced it by famine and, after holding a council which deposed Benedict, restored Leo VIII. to the papal throne.

The emperor's arbitrary exercise of power roused a long and obstinate resistance. When Leo VIII. died in 965, the imperial party elected John XIII. (965-972), who tried to create a party of nobles to offset the power of the party of Alberic. Upon this there was a general revolt. The nobles were led by Peter, prefect of Rome. The leaders of the people were 12 *deaconi*, a term of unknown derivation but probably indicating chiefs of the 12 regions. The new pope was seized and imprisoned; but the emperor quickly marched against Rome, and this was sufficient to produce a reaction which recalled the pope (Nov. 966), sent the prefect into exile and put several of the rebellious nobles to death. Shortly after the emperor sacked the city; many Romans were exiled, some tortured, others, including the 12 *deaconi*, killed.

The Crescentii.—Pope John XIII. was succeeded by Benedict VI. (973-974) and Otto I. by his son Otto II., a youth of 18. Thereupon the Romans, who had supported the election of another pope, and were in no awe of the new emperor, rose to arms under the command of Crescentius, a rich and powerful noble. They not only seized Benedict VI. by force, but strangled him in the castle of St. Angelo. The factions then successively elected popes who were either exiled or persecuted, and one of them is said to have been murdered. During this turmoil the anti-imperial party, led by Crescentius II., son of the Crescentius mentioned above, had taken possession of the government. Crescentius assumed the title of patrician and sought to imitate Alberic. Fortunately for him, the reigning pope was a detested tyrant, and the emperor Otto III., a child entirely guided by his mother. But the emperor was backed by a powerful party, and on coming to Rome in 996 was able, although only aged 15, to quell the rebellion, oust Crescentius from public life, and elect as successor to John XV. his own cousin, Gregory V. (996-999). This first German pope surrounded himself with compatriots, and by raising them to lofty posts even in the tribunals excited a revolt that drove him from the throne (Sept. 29, 996). Crescentius, being master of the castle of St. Angelo, resumed the title of patrician, expelled the German judges, reconstituted the government and created a new pope. The following year Otto III. came to Rome, and his party opened the gates to him. Although deserted by nearly all his adherents, Crescentius held the castle valiantly against its besiegers, until, on April 29, 998, he was forced to make terms, and the imperialists, violating their pledges, first put him to torture and then hurled him from the battlements.

Thus Otto III. was enabled to establish his mastery of Rome. He wished to reconstitute a Romano-Byzantine empire with Rome for his capital. Nevertheless he was German, and during his reign Germanic institutions made progress in Rome and many families of feudal barons arose. The Church made grants of lands, cities and provinces in the feudal manner, while the bishops, like feudal barons, became actual counts. Meanwhile the Roman barons were growing more and more powerful, and were neither submissive nor faithful to the emperor. On the contrary, they

resented his attitude as a master of Rome, and, when he subjected Tivoli to the Holy See, attacked both him and the pope with so much vigour as to put both to flight (Feb. 16, 1007).

By the emperor's death in Jan. 1002 the family of the Ottos became extinct; the papacy then began to decline, and the nobles, divided into an imperial and an anti-imperial party, were again predominant. They reserved to themselves the office of patrician, and, electing popes from their own ranks, obtained enlarged privileges and power. John Crescentius was elected patrician; one of his kinsmen was invested with the office of prefect, and the new pope John XVIII. (1003-09) was one of his creatures. His power lasted for ten years, until his death in 1012. Pope Sergius IV. having died the same year, the count of Tusculum compassed the election of Benedict VIII. (1012-24), one of his own kin. This pope expelled the Crescentii, changed the prefect and reserved the title of patrician for Henry II. whom he consecrated emperor on Feb. 14, 1014. He also succeeded in placing his own brother, Romano, at the head of the republic with the title of "Senator of all the Romans." The prefect still retained his authority, and the emperor was by right supreme judge; but when a violent revolt broke out the emperor only stayed to suppress it and then went to Germany in disgust. The pope, aided by his brother, conducted the government with energy; he awed the party of Crescentius and waged war against the Saracens in the south. When he died in 1024 there was a repetition of the same events that had followed the death of Alberic, and with no less fatal consequences. Benedict's brother, Romano, head of the republic, was, although a layman, elected pope. He took the name of John XIX. (1024-33), and in 1027 conferred the imperial crown on Conrad the Salic. The latter abolished the Lotharian edict of 824 and decreed that throughout Rome and its territory justice should be administered solely by the Justinian code.

The Three Rival Popes.—John XIX. was succeeded by his nephew, Benedict IX. (1033-45), whose brother became head of the republic. Thus Church and State assumed the aspect of hereditary possessions in the powerful house of the counts of Tusculum. The vices and excesses of Benedict were so monstrous that he was driven from the city and Sylvester III. elected by his opponents. Benedict still had some support and succeeded in driving out Sylvester; then, finding his position untenable, he sold the papacy to a reformer who took the name of Gregory VI. Benedict soon attempted to regain his office, and in 1045 three popes were struggling for the tiara in the midst of scandal and anarchy. The streets and neighbourhood of Rome swarmed with thieves and assassins; pilgrims were plundered; citizens trembled for their lives, and petty barons threatened the rival popes, who were obliged to defend themselves by force. This state of things lasted until Henry III. came to re-establish order. He summoned a synod which deposed the three popes, and then, with the consent of the Romans, assuming the right of election, proposed a German, Clement II., who was consecrated at Christmas 1046. Henry III. was then crowned, and also took the title of patrician.

Henry III. procured the election of four German popes in succession. But the fourth German pope, Victor II., died in 1057, and Henry III. had been succeeded in 1056 by the young Henry IV. under the regency of a weak woman, the empress Agnes. The nobles by violence and bribery brought about the election of Benedict X. The cardinals were opposed to him and, fleeing from the city, elected Nicholas II. (1059-61). This pope could only enter Rome when escorted by the troops of Godfrey of Tuscany. When Nicholas died the nobles, assisted by some Lombard bishops, elected Honorius II. and sought aid from the German king, while the cardinals chose Alexander II. (1061-73). Although supported by an armed force of Normans, the latter had to fight his way into Rome, whither Honorius II. soon followed and won a battle against the forces of Alexander II. with much slaughter. Both candidates were compelled to withdraw from the city until their claims were settled by the German court. Strife continued, but Alexander II. finally was recognized as pope and attempted to reform the church, though he had little power in the city.

At Alexander's funeral Hildebrand was seized by the crowd

and acclaimed as pope. The cardinals who were favourable to him, hastened to go through the form of an election in order to give a legal warrant to what had been done by popular violence; he chose the name of Gregory VII. (1073-85) and secured recognition from Henry IV. Gregory confirmed his predecessor's decrees against simoniacal and non-celibate priests and forbade the clergy to receive investiture at the hands of laymen. As the high ecclesiastical dignitaries held much territory and were also high officials of the empire, this decree was certain to cause a fierce contest between the emperor and the pope. Some of the nobles had already shown their hostility to Gregory; at Christmas 1075 the prefect Cencius and other nobles seized Gregory while he was celebrating mass in Santa Maria Maggiore and dragged him away to imprisonment. The people were incensed at this outrage and fear of popular wrath compelled Cencius to release Gregory. About the same time Henry IV., exasperated by a letter in which Gregory had sharply rebuked him for his sins, declared Gregory deposed from the papacy, and Gregory in turn decreed the excommunication and deposition of the emperor. That monarch afterwards made submission to Gregory at Canossa (1077), then again turned against him and was again excommunicated. In 1081, with his anti-pope Clement III., he besieged Rome in vain. He was equally unsuccessful in each of the two following years, but at last forced his way into the city (March 1084) and compelled Gregory to seek refuge in the castle of St. Angelo. The emperor, as master of Rome, procured the consecration of Clement III., by whom he was crowned in turn. He then attacked and seized the capitol and assaulted the castle of St. Angelo in the hope of capturing the pope. But Robert Guiscard brought his Norman army to the rescue. Emperor and anti-pope fled; the city was taken, the pope liberated, and Rome was brutally sacked for three days by the Normans. After this Gregory, broken with grief and hated by the Romans, had to go away with the Normans and died at Salerno on May 25, 1085.

Victor III. was elected only after an interval of a year and reigned only a short time. He was consecrated in St. Peter's but was unable to maintain his position in Rome. Urban II. (1088-99), the next pope elected, also had little power in Rome, as the city was usually in the hands of the supporters of the anti-pope. It was not until 1096, when he had won prestige by preaching the crusade, that he could enter the city as its master, and even then the castle of St. Angelo was held by the followers of the anti-pope, until 1098.

Revolt Under Paschal II.—Pope Paschal II. (1099-1118) tried to rule the city through the faction of nobles who favoured him, but with little success, as the imperial party frequently had the upper hand. When Henry V. seized the pope in 1111 the people rose in his defence and forced Henry to leave the city; but under ordinary circumstances Paschal could not count on any hearty support. In 1116, when he wished to make one of the Pierleoni prefect, there was a bloody revolt and a rival was put in as prefect by the imperial partisans. Soon after this Henry V. came to Rome and Paschal had to flee. Later he returned with Norman troops but could not put down the revolt, and the opposition still held the capitol when Paschal died.

The cardinals met in haste and secretly elected Gelasius II. The election had scarcely been completed when Cencius Frangipani broke into the assembly, seized the pope and carried him bleeding to one of the Frangipani towers. As they had done when another Cencius had seized Gregory VII., the people of the 12 districts rose in their wrath and, led by the prefect (whose election Paschal had opposed), forced the Frangipani to give up their prisoner. The Frangipani fled to the emperor and he came to Rome. Gelasius had to flee to his native city of Gaeta, where he was safe under Norman protection. An anti-pope was chosen by the imperial party; but when Henry left Rome Gelasius was able to return, although the anti-pope was also in Rome and a new revolt threatened the life of Gelasius. Consequently he fled to France, where he died in 1119, having been pope a year and a few days.

Calixtus was next chosen and restored peace. The Frangipani succeeded in electing his successor Honorius II. (1124-30), who was quietly accepted by the Roman people. At his death some of

the cardinals chose Innocent II.; others, and the more numerous part, elected one of the Pierleoni, who took the name of Anacleto II. The greater part of the people now favoured the Pierleoni, and his rival, who was supported by the Frangipani, had to flee. He secured support in France and Germany, especially through the aid of Bernard of Clairvaux, and was finally recognized as pope almost everywhere except in Rome and among the Normans in Italy. Anacleto II. retained the upper hand in the city almost until the time of his death in 1138. In the following year Innocent attempted a military campaign against Roger of Sicily, but was captured by him and compelled to acknowledge his kingship, with which he had been invested by Anacleto. Humiliated, Innocent returned to Rome and there he was to suffer further humiliation.

Rise of the Commune.—Throughout upper and central Italy the cities were being organized as free and independent communes on a democratic basis. Their example was followed in the ancient duchy of Rome and almost in the immediate neighbourhood of the city. The same tendencies were at work in Rome. Gradually in the troubled times when the factions of the nobles were contending together and the papal rule was so weak, a lesser nobility had grown into power in the city, in alliance with the people, with whose interests they had much in common. They were irritated against the pope by his submission to the Normans and this irritation was greatly increased by his attitude toward Tivoli. In 1142 this city openly rebelled against the mother city, and the pope sent the Romans to subdue it. They were not only repulsed, but ignominiously pursued to their own gates. Afterwards, returning to the assault in greater numbers, they conquered the hostile town. Its defenders surrendered to the pope, and he immediately concluded a treaty of peace without consulting the people. The soldiery, still flushed with victory, were furious at this slight. They demanded the submission of Tivoli to the Roman people, as well as permission to demolish its walls and dwellings and expel its population. Innocent II. refused his consent and a revolution ensued. In 1143 the rebellious people rushed to the capitol, proclaimed the republic, reconstituted the senate, with the almost entire exclusion of the nobles, and declared the abolition of the temporal power. Just after this Innocent died.

The pontificates of the next two popes, together, lasted less than 17 months. The second, Lucius II. (1144-45), tried to withstand the revolution by seeking Norman aid and throwing himself into the arms of the feudal party, but this only precipitated the course of events. The people, after having excluded nearly all aristocrats from the senate, now placed at its head the noble Jordan Pierleoni, who had joined the revolutionary party. They named him patrician, and also conferred on him the judicial powers appertaining to the aristocratic and imperial office of prefect. The pope was requested to resign the temporal power, the regalia and every other possession and content himself with the tithes and offerings of the faithful. He indignantly refused, marched at the head of the nobles against the capitol, but was repulsed, and received a blow on the head from a stone, which is supposed to have caused his speedy death, Feb. 15, 1145. Eugenius III. was then elected (1145-53), but soon had to flee to Viterbo in quest of armed assistance, in consequence of the senate's resolve to prevent by force his consecration until he recognized the new state of things in the Eternal City.

It was at this time that Arnold of Brescia (*q.v.*) was absolved by the pope and ordered to make a pilgrimage to Rome. An arch-revolutionist, he began to preach and his eloquence brought him fame. But his influence on events has been greatly exaggerated in most accounts. The people had already formed an equestrian order, which was probably a mounted force of the lesser nobility, and also were fortifying the capitol. The revolution spread beyond the walls, several cities of the state proclaimed their independence, and the barons of the Campagna profited by the opportunity to act as independent sovereigns. Thus the whole domain of the Church was threatened with dissolution. The pope marched towards Rome with an army, but hoped to come to terms. The Romans in fact recognized his authority, and he in his turn recognized the republic. The office of patrician was abolished, and the prefect was revived. The senators received

investiture from the pope, who returned to Rome at Christmas 1145.

The Commune Fully Constituted.—The commune now seems to have been fully constituted, so a short sketch will be given here of its more important features. The senate was drawn, at least in part, from the lower classes and the petty nobility, and this was the special characteristic of the new revolution. In 1144 there were 56 senators, but the number often varied. In 1151 there were 50; in 1163 only 25; in 1181 again 56, and still more in 1191. After that it was more usual to have only one or two senators and these were generally chosen from the aristocracy. From the few existing documents of the period we learn that the senators were divided into *senatores consilarii* and ordinary senators. The former constituted a smaller council, which consulted with the head or heads of the republic on the more urgent and secret affairs of the State. The senate exercised its powers under the control of the council and parliament. The former was a deliberative assembly called together by the senate to discuss important affairs such as treaties or declarations of war. The councillors varied in number—at times nine, once as many as 84. Their advice was taken but not necessarily followed by the senate. The parliament was an assemblage of all the citizens. In it there was no discussion of the matters brought before it by the senate, but each matter was accepted or rejected by the people. Senators held office for only one year. They were elected usually by the whole people; but at times the pope was allowed to appoint an elector or electors to choose the senator or senators; in this latter case, however, the choice apparently had to be submitted to the popular assembly for ratification. The pope also was compelled to pay salaries to the senators and their officials.

The senate had usurped the right of coinage; and although by a treaty of 1188 it agreed to restore this right to the pope on condition that one-third of the money coined should be given to the senate, the pope did not take advantage of the retrocession and all the money was coined by the senate; Innocent III. even decreed that only senatorial coins should be used in the whole of the Campagna. The senate also seized for its own advantage the right of levying taxes on merchandise brought into the city. It also took over the appointment of judges, but in place of seven appointed a single Palatine Judge for a term of three months. He was assisted by a *judex datus*. Thus it is seen that while the pope still exercised certain rights he had actually lost control of the city.

The agreement with Pope Eugenius was of short duration. The revolution could not be checked; the Romans desired independence, and their spiritual lord fled to France, whence, in 1147, he proclaimed a new crusade, while the Romans were employed in demolishing Tivoli, banishing its inhabitants and waging war on other cities. Jordan Pierleoni was head of the republic, and Arnold, supported by the popular favour and the enthusiasm of the lower clergy, was preaching with even greater fervour than before. The new pope now re-entered Italy, proclaimed Arnold a schismatic, and advancing to Tusculum assembled an army in order to attack Rome. In this emergency the Romans applied to Conrad III., the first emperor of the house of Hohenstaufen; and their letters are expressive of Arnold's theories and his medley of ancient and modern, sacred and profane, ideas. "Rome," so they said, "is the fountain of the empire confided to you by the Almighty, and we seek to restore to Rome the power possessed by her under Constantine and Justinian. For this end we conquered and destroyed the strongholds of the barons who, together with the pope and the Normans, sought to resist us. These are now attacking us on all sides. Haste to Rome, the capital of the world, thus to establish thy imperial sway over the Italian and German lands." After long delay the king of the Romans replied to these appeals, stating that he would come "to re-establish order, reward the faithful and punish the rebellious." These words promised ill. In fact, Conrad had already arranged terms with the pope; but his life came to an end on Feb. 15, 1152.

Frederick Barbarossa.—He was succeeded by Frederick I., surnamed Barbarossa, who took no notice of letters urging him to come and receive the empire from the Roman people. In accord-

ance with his design of subduing all the independent cities, he made an agreement with the pope, in which he vowed to give no truce to the Romans, but subject them to their spiritual lord, whose temporal power should be restored. The pope, on his side, promised to crown him emperor. Thereupon the people again rose to arms and broke off all negotiations with Eugenius III. Frederick was in command of a powerful army, and was no friend of half measures. To increase the gravity of the situation, an English pope, Adrian IV., was elected (1154-59), who was also a man of strong and resolute temper. In fact, even before he was able to take possession of the Lateran, he requested the Romans to banish Arnold, who was directing his thunders against the papacy. These utterances increased the wrath of Adrian, who, encouraged by the knowledge that Frederick and his host were already in Italy, at last launched an interdict against Rome. It was the first time that a pope had laid an interdict on the Eternal City. This put a summary stop to the religious life of the inhabitants and men's minds were seized with terror; a fierce tumult broke out. Thereupon the senators implored pardon; but Adrian demanded the expulsion of Arnold before consenting to raise the interdict. Arnold was therefore obliged to leave Rome, and, abandoned by all, was forced to wander from castle to castle, until given up to Frederick Barbarossa and then consigned by the latter to the papal legates. The pope in his turn gave the reformer into the hands of the prefect, who hanged his prisoner, burnt his body at the stake, and cast his ashes into the Tiber.

But the Romans would not give up their commune. Their envoys went to meet Frederick near Sutri, and made an address in the usual fantastic style on the privileges of the Roman people and its sole right to confer the imperial crown. Frederick indignantly cut short their harangue, and they had to depart full of rage. He then continued his march, and, entering Rome on June 18, 1155, was forthwith crowned in St. Peter's by the pope. Thereupon the Romans rushed to arms and made a furious attack on the Leonine city and the imperial camp. A desperate battle went on throughout the day; many Romans perished by the sword or by drowning, but their fellow-citizens made such determined preparations to continue the struggle that Frederick, on June 19, hastily retreated, or rather fled, together with the pope and the cardinals. The commune still survived. Its existence was in truth favourable rather than injurious to Frederick, but he had not yet discerned that his best policy would be to support the commune against the pope. The latter, with keener acumen, made alliance with the communes of Lombardy and encouraged them in their resistance to the emperor. Adrian IV. died in 1159, and the anti-imperial party elected Alexander III. (1159-81), who energetically opposed the pretensions of Frederick, but, having to struggle with three anti-popes successively raised against him by the imperial party, was repeatedly driven into exile. During these schisms the senate quietly carried on the government, administered justice and made war on some neighbouring cities and barons. An army comprising many nobles marched against Tusculum, but found it defended by several valiant officers and a strong band of German soldiery, who, on May 29, 1167, inflicted on the Romans so severe a defeat that it is styled by Gregorovius "the Cannae of the middle ages." Shortly afterwards the emperor arrived in Rome with his anti-pope Paschal III., and Alexander had to flee. Then, at last, Frederick came to terms with the commune, recognized the senate, which accepted investiture at his hands, re-established the prefecture as an imperial office, and bestowed it on John, son of Peter di Vico. He departed hastily, as a deadly fever broke out and decimated his army.

Concord between Pope and Commune.—Meanwhile Pope Alexander continued Adrian's policy with better success, however, for the Lombard cities had now formed a league and inflicted a signal defeat on the emperor at Legnano on May 29, 1176. One of the results of this battle was the conclusion of an agreement between the pope and the emperor, the latter resigning his pretensions on Rome and yielding all that he had denied to Adrian. By the Treaty of Venice (Aug. 1, 1177), the anti-pope was forsaken, Alexander III. recognized and hailed as the legitimate pontiff and the prefect of Rome was again to be nominated

by the pope, to whom the emperor restored the temporal power, acknowledging him the independent sovereign of Rome and of the ecclesiastical State. Frederick's troops accompanied the pope to Rome, where the commune was forced to make submission to him. But, proudly conscious as it still was of its strength, its surrender wore the aspect of a voluntary concession, and its terms began with these words: "It has been decreed by the council and deliberation of the whole Roman people," etc. The senators, elected yearly in November, had to swear fealty to the pope. On his return to Rome Alexander received a solemn welcome from all. He died on Aug. 30, 1181. The fact that between 1181 and 1187 there were three popes always living in exile proves that the commune was by no means crushed. On Dec. 20, 1187, Clement III. (1187-91) made a solemn agreement with the government of the capitol before coming to Rome. And this peace or *concordia* had the air of a treaty between potentates of equal importance. Rome confronted the pope from the same standpoint from which the Lombard cities had confronted the emperor after Legnano. This treaty was confirmed on the last day of May 1188 (*Anno XLIV.* of the senate). The pope was recognized as supreme lord, and invested the senators with their dignity. Almost all the old pontifical rights and prerogatives were restored to him. The pope might employ the Roman militia for the defence of his patrimony, but was to furnish its pay. The rights of the Church over Tivoli and Tusculum were confirmed; but the commune reserved to itself the right of making war on those cities, and declared its resolve to dismantle and destroy the walls and castle of Tusculum. In this undertaking the pope was to co-operate with the Romans, even should the unhappy city make surrender to him alone.

From all this it is clear that the Church had been made independent of the empire, and that the commune, despite its numerous concessions, was by no means subject to the Church. The republic had no patrician nor any other imperial magistrate and preserved its independence even as regarded the pope, who merely granted investiture to magistrates freely chosen by the people and had no legislative nor administrative power in the city. Its temporal dominion was limited to his great possessions, to his regalia, to a supreme authority that was very indefinite, and to a feudal authority over the barons of the Campagna and many cities of a State that seemed ever on the point of dissolution. The senate continued to frame laws, to govern, and to administer justice. The army carried on the wars of the commune, as we see by the tragic fate of Tusculum, which was razed to the ground on April 19, 1191. In consequence, the nobles, seeing that the commune remained firmly established, began to adhere to it and succeeded in obtaining admission to the senate. In fact, whereas since 1143 plebeians and petty nobles had prevailed in its ranks, nobles of ancient descent are now found outnumbering the knights and burghers. In 1191 this state of things caused a sudden popular outbreak which abolished the aristocratic senate and gave the headship of the commune to a single senator, of unknown origin. During the two years he remained in office this personage stripped the pope of his revenues, despatched *justitieri* even to the provinces, and with the aid of the parliament and council promulgated laws and statutes. He was overthrown by a counter-revolution; John Capocci of the party of the nobles became senator for two years, and had been succeeded by one of the Pierleoni when, in 1197, a fresh revolution re-established a senate of 56 members, chiefly consisting of feudal barons in high favour with Henry VI., who had revived the imperial faction in Rome. But this emperor's life ended the same year, and the pope's in 1198, and the new pontiff, Innocent III. (1198-1216), began to make war on the nobles, who were again masters of the commune. Their leader was the prefect Peter di Vico. Owing to the revolution of 1143, most of the prefectorial attributes were now vested in the senate; nevertheless, Peter still retained a tribunal of police both within and without the city, and derived great strength from the vast possessions of the Vico family, in which the office of prefect now became hereditary. Very soon after this, however, the independent municipal office lost its true character. Then the popes made a point of according great pomp and dignity to this nominal

prefect, in order to overshadow the senator, who still represented the independence of the republic.

Innocent III, dissatisfied with this state of things, contrived by bribing the people to arrogate to himself the right of appointing a commissioner to elect the senator, who had to swear fealty and submission to the pope, and also that of nominating the provincial *justitarii*, formerly chosen by the government of the capital. This was a deadly blow to the commune, for the principal rights of the people—*i.e.*, the election of pope, prefect, and senate—were now lost. The general discontent provoked fresh revolutions, and the people made a loud outcry for a senate of 56 members; the pope, making a virtue of necessity, caused that number to be chosen by 12 *mediani* specially named by him for the purpose. Even this did not calm the popular discontent, and when, six months later, the pope again had a single senator elected the Romans rose to arms and in 1204 formed a government of "Good Men" (*Buoni Uomini*) in opposition to that created by the pope. But an amicable arrangement being concluded, the pope once more had 56 senators nominated; and when, soon after, he again reduced them to one, the people were too weary to resist (1205).

Pretensions of the Commune.—On Nov. 23, 1220, Honorius III. (1216-27) conferred the imperial crown on Frederick II., who confirmed to the Church the possession of her former States, of those bequeathed to her by Countess Matilda, and even of the March of Ancona. But it was soon seen that he sought to dominate all Italy, and was therefore a foe to be dreaded. The successor of Honorius, Pope Gregory IX. (1227-41), was speedily insulted and put to flight by the Ghibelline nobles, whose courage had revived, and the republic began to subvert the Larian cities on its own account. Peace was several times made and unmade by pope and people; but no enduring harmony was possible between them, since the former wished to subject the entire State to the Church, and the latter to escape from the rule of the Church and hold sway over "the universal land from Ceprano to Radicofani" formerly belonging to the duchy. Accordingly, the Roman people appointed judges, imposed taxes, issued coin, and made the clergy amenable to secular tribunals. In 1234 the senator Luca Savelli published an edict declaring Tuscia and Campania territories of the republic, and sent judges thither to exact an oath of obedience. He also despatched the militia to the coast, where it occupied several cities and erected fortresses; and columns were raised everywhere inscribed with the initials S.P.Q.R. The pope, unable to prevent but equally unable to tolerate these acts, fled from Rome, hurling his anathema against Savelli and his associates. The Romans sacked the Lateran and the houses of many cardinals and marched on Viterbo, but were driven back by the papal troops. The people had to make peace and submission in 1235, and were obliged to give up their pretensions of subjecting the clergy to ordinary tribunals and the urban territory to the commune. Thus matters were virtually settled on the footing established by Innocent III., thanks to the aid given to the pope by Frederick II., who had previously aided the rebellion.

Meanwhile the struggle between Frederick II. and the pope was once more renewed. The nobility was again split into a Guelph party headed by the Orsini and a Ghibelline party under the Colonna. In 1238 it was deemed advisable to elect two senators instead of one, in the hope of conciliating both factions by simultaneously raising them to power. Afterwards one only was elected, alternately an Orsini and a Colonna, then again two, and so on. But all these changes failed in their aim, since the struggle between emperor and pope exasperated party feeling in Rome. Frederick desired to emancipate the State from the Church, but he was opposed to the communal democracy, which was then the chief strength of the secular State in Italy. Thus, although he had a strong party in Rome, it seemed to dissolve at his approach, inasmuch as all feared that he might abolish the statutes and liberties of the commune. In fact, when he advanced towards Rome on the death of Gregory IX. in 1241, he was energetically repulsed by the people, and later even by Viterbo, a city that had always been faithful to him. After he had withdrawn, his adherents gained strength and put to flight his oppo-

nent, Innocent IV. (1243-54), the newly elected pope, who then from Lyons hurled an excommunication against him. On Frederick's death in Dec. 1250 the pope instantly returned to Rome with the set purpose of destroying the power of the Hohenstaufens.

Brancalone.—The commune meanwhile being harassed by the factiousness of the nobility in 1252 decided on the election of an alien senator armed with ample powers, precisely as other communes gave the government into the hands of a podestà. Accordingly a Bolognese noble, Brancalone degli Andalò, count of Casalecchio, and a Ghibelline, was invited to Rome. Before accepting office he insisted on making definite terms; he desired to hold the government for three years; and this although contrary to the statutes, was granted. Further, to insure his personal safety, he demanded that many scions of the noblest Roman houses should be sent as hostages to Bologna; and to this also the commune consented. Then, in Aug. 1252, he came with his judges and notaries, made oath to observe justice and the laws, and began to govern. He was head of the republic in peace and in war, supreme judge and captain in chief. He nominated the podestàs of subject territories, despatched ambassadors, issued coin, concluded treaties, and received oaths of obedience. He convoked the council as seldom as was possible, although he frequently assembled the people in parliament. The chief complaint made against him was of undue severity in the administration of justice. He rendered the clergy amenable to secular tribunals, subdued the neighbouring cities of Tivoli, Palestrina, etc., and commanded in person the attacking force. But his greatest energy was directed to the repression of the more turbulent nobles, hanging some and banishing others. He recognized the expediency of winning the popular favour and was the first senator to add to his title that of "captain of the people." He befriended the people by promoting the organization of guilds, 13 in all. The admission of their heads into the councils of the commune in 1267 shows how far their interests had been promoted by Brancalone.

When, on the expiration of his three years' term of office, Brancalone's re-election was proposed, his enemies rose against him, accused him, threw him into prison, and vehemently protested against the continuance of "foreign tyranny." His life was spared only on account of the hostages sent to Bologna. The next senator chosen was a Brescian Guelph, Emanuele de Madio, a tool of the nobles, who were masters of the situation. But soon afterwards, in 1257, the people rose in revolt, drove the nobles from power, put the pope to flight, and recalled Brancalone for another three years' term. He ruled more sternly than before, hung several nobles, and made alliance with Manfred, the representative of the Swabian party in Italy. This rendered him increasingly odious to the pope and procured his excommunication. But, disregarding the thunders of the Church, he marched against Anagni, the pope's birthplace, and Alexander was quickly obliged to humiliate himself before the senator of Rome. Brancalone next set to work to destroy the fortified towers of the nobility, and in raising them to the ground ruined many of the adjacent dwellings. In 1263 Brancalone died. Thus ended the career of a truly remarkable statesman. He was succeeded by his uncle, Castellano degli Andalò, who only retained office until the following spring (1259). Then the people, being bribed by the pope, joined with the nobles and overthrew him. His life too was saved by having followed his nephew's shrewd plan of sending hostages to Bologna. Two senators of Roman birth were next elected.

Charles of Anjou Senator.—At this period the fall of the empire had induced many Italian republics to seek strength by placing their governments in the hands of some prince willing to swear respect for their laws and to undertake their defence. In Rome the Guelphs and Ghibellines proposed various candidates for this office, and after many fierce quarrels ended by electing a committee of *boni homines* charged with the revision of the statutes, reorganization of the city, and choice of a senator. This committee set for more than a year without nominating anyone; then, the Guelph party being predominant, the majority agreed on the election as senator of Charles of Anjou, who after a long delay became senator, but held office for less than a year. Two Romans were elected in his stead, but soon

fell out with the pope, because the Guelph nobles again tried to exercise tyranny. The people, however, profited by these disturbances to rise on their own account, and formed a democratic government of 26 *boni homines* with Angelo Capocci, a Ghibelline, as its captain. By this government Don Henry, son of Ferdinand III., of Castile, was elected senator (1267). The rule of the new senator was very energetic, for he kept down the clergy, subdued the Campagna, persecuted the Guelph nobles, made alliance with the Tuscan Ghibellines, forcibly drove back the troops of King Charles, who was advancing towards Rome, and gave a splendid reception to Conradin. But the battle of Tagliacozzo (Aug. 23, 1268), followed by the murder of Conradin, proved fatal to the Ghibelline party. Charles was re-elected senator immediately after the battle, and the pope confirmed his powers for a term of ten years.

In 1278, the ten years' term having expired, the pope, after declaring that he left to the people the right of electing the senator, promulgated a new constitution (July 18, 1278), which, while confirming the rights of the Church over the city, prohibited the election of any foreign emperor, prince, marquis, count or baron as senator of Rome. Thus the Colonna, Savelli, Orsini, Annibaldi and other Roman nobles again rose to power, and the republic was again endangered and plunged into disorder. The Romans then gave the reconstitution of the city into the pope's hands by yielding to him the right of nominating senators. So Nicholas proceeded to name senators, alternating a Colonna with an Orsini, or simultaneously choosing one of each faction. The same power over the senate was granted with the same restriction to Martin IV. (1281-85), and he at once re-elected Charles of Anjou. Thus, greatly to the disgust of the Romans, the capitol was again invaded by French vicars, notaries, judges and soldiery. But the terrible blow dealt at Charles's power by the Sicilian Vespers (March 31, 1282) resounded even in Rome. The Orsini, backed by the people, rose in arms, massacred the French garrison, and quickly re-established a popular government. John Cencio, a kinsman of the Orsini, was elected captain and defender of the people, and ruled the city with the co-operation of the senator and a council of priors of the guilds. This government was of brief duration, for, although the pope had professed his willingness to tolerate experiment, he quickly arranged fresh terms, and, forsaking Charles of Anjou, again nominated two Roman senators. Pope and king both died in 1285, and Nicholas IV. (1288-92), also holding sway over the senate, favoured the Colonna in order to curb the growing mastery of the Orsini. But thus there were two powerful houses instead of one. In fact, John Colonna, when elected senator, ruled from the capitol as an independent sovereign, conducted in person the campaign against Viterbo, and subjected that city to the republic on May 3, 1292.

Boniface VIII. (1294-1303) tried to reduce the power of the Colonna family and succeeded for a time in exercising more power in Rome than any of the recent popes. This was due largely to the Jubilee which brought thousands of pilgrims to Rome. The citizens wished to profit by the gold which the pilgrims brought and for that reason were ready to postpone their rivalries.

Removal of the Popes to Avignon.—When the popes removed to Avignon the city was left almost entirely to govern itself. There was the same strife between the "ins" and the "outs," who persisted in using the names Guelphs and Ghibellines, although these names had lost their old meaning since the fall of the Hohenstaufens. The commune employed its freedom in trying to hold its own against the nobles, whose power was much lessened by the absence of the pope, and endeavoured to gain fresh strength by organizing the 13 regions. Accordingly, in 1305, a captain of the people was elected with 13 elders and a senator, Paganino della Torre, who governed for one year. The pope was opposed to these changes at first, but in 1310 he issued a brief granting Rome full permission to select its own form of government. Thus, the first pope in Avignon restored the rights of the Romans. The latter still considered Rome the Eternal City, the source of all law, and the only natural seat of the spiritual and temporal government of the world. To their republic, they thought, appertained a new and lofty destiny. In 1312, in spite

of the opposition of the nobles, they insisted upon the coronation of the emperor Henry VII. In the same year, after a brief interval of rule by the nobles, the popular party again got the upper hand, only to be overthrown the following year.

Then the pope appointed King Robert of Naples as senator. Affairs took a fresh turn under Pope John XXII. (1316-34). Rome was still ruled by the vicars of King Robert; but, owing to the continued absence of the pope, matters grew daily worse. Trade and industry declined, revenue diminished, the impoverished nobles were exceedingly turbulent, deeds of murder and violence occurred on all sides; even by day the streets of the city were unsafe. Hence there was universal discontent. Accordingly the Italian Ghibellines hailed Louis the Bavarian as they had previously hailed Henry. The Roman people were roused to action, and, driving out the representatives and partisans of King Robert, in the spring of 1327 seized on the castle of St. Angelo and again established a democratic government. Regarding the reproofs of the pope, they elected a haughty Ghibelline, Sciarra Colonna, captain of the people and general of the militia, with a council of 52 *popolani*, four to each region. Then ranged under the standards of the militia, the Romans gave chase to the foes of the republic, and Sciarra, returning victorious, ascended to the capitol, and invited Louis the Bavarian to Rome.

Encircled by a crowd of heretics, reformers and Minorite brethren, Louis convoked a parliament on the capitol, asking that the imperial crown might be conferred upon him by the people, from whom alone he wished to receive it. And the people proclaimed him their captain, senator and emperor. On Jan. 17, his coronation took place in St. Peter's. But, as he had neither money nor practical sense, his method of taxation and the excesses committed by himself and his over-excited philosophers speedily aroused the popular discontent. His ecclesiastical vicar, Marsilius of Padua, and John Janduno placarded the walls with insulting manifestos against the pope, whom the Minorites stigmatized as a heretic and wished to depose. The emperor decreed that henceforth the popes must reside in Rome—that if, when invited, they should fail to come they would be thereby held deposed from the throne. As a logical consequence, proceedings were immediately begun for the election of a new pope, Nicholas V., who on May 12 was proclaimed by the popular voice in St. Peter's square, and received the imperial sanction. But this ephemeral drama came to an end when the emperor departed with his anti-pope on Aug. 4. This caused the immediate downfall of the democratic government. A new parliament cancelled the emperor's edicts, and had them burnt by the public executioner. Meanwhile King Robert was again supreme in Rome, and being re-elected senator appointed vicars there as before. Anarchy reigned.

After the election of Benedict XII. (1334-42) confusion reached so great a pitch that, on the expiration of Robert's senatorial term, the Romans named 13 heads of regions to carry on the government with two senators, while the king still sent vicars as before. The people, for the sake of peace, once more granted the supremacy of the senate to the pope, and he nominated two senators. But in 1339 the Romans attacked the capitol, named two senators of their own choice, re-established a democratic government, and sent ambassadors to Florence to ask for the ordinances of justice by which that city had broken the power of the nobles, and also that a few skilled citizens should lend their help in the reconstitution of Rome. Accordingly some Florentines came with the *ordinamenti*, some portions of which may be recognized in the Roman statutes, and, after first rearranging the taxes, elected 13 priors of the guilds, a gonfalonier of justice, and a captain of the people after the Florentine manner. But there was a dissimilarity in the conditions of the two cities. The guilds having little influence in Rome, the projected reform failed, and the pope, who was opposed to it, re-elected the senators. Thereupon public discontent swelled. Another revolution in Rome re-established the government of the 13 elders and the two senators.

Cola di Rienzi.—The people, anxious to show their intention of respecting the papal authority, had despatched to Avignon as ambassador of the republic, in 1343, Cola di Rienzi (*q.v.*), who

begged the pope to return to Rome, to allow the city to celebrate a jubilee every 50 years, and then, as a personal request, asked to be nominated notary to the urban chamber. The pope consented to everything, and Rienzi communicated this good news to Rome in an emphatically worded epistle. After Easter, in 1344, he returned to Rome and found that the city was a prey to the nobles. He secretly built up a party of conspirators and in May 1347 convoked a parliament of the people and obtained its sanction for the following proposals: that all pending lawsuits should be at once decided; that justice should be equally administered to all; that every region should equip 100 foot soldiers and 25 horse; that the dues and taxes should be rearranged; that the forts, bridges, and gates of the city should be held by the rector of the people instead of by the nobility; and that granaries should be opened for public use. On the same day, amid general homage and applause, Rienzi was proclaimed head of the republic, with the title of tribune and liberator of the Holy Roman Republic, "by authority of the most merciful Lord Jesus Christ." The nobles withdrew scoffing but alarmed. Rienzi engaged a body-guard of 100 men, and assumed the command of the 1,300 infantry and 90 light horse; he abolished the office of senator, retained the Thirteen and the general and special councils, and set the administration on a new footing. These measures and the prompt submission of the other cities of the State brought an instant increase of revenue to Rome.

The pope, willingly or unwillingly, accorded his approval to Rienzi's deeds. The provincial cities did homage to Rome and her tribune, and almost all the rest of Italy gave him its enthusiastic adherence. Great men like Petrarch were transported with joy. But on the convocation of a national parliament few representatives obeyed the summons and the scheme was a failure. Nevertheless, on Aug. 15, Rienzi caused himself to be crowned tribune with great pomp, and confirmed the rights of Roman citizenship to all natives of Italy. The nobles remained steadily hostile; conflict was unavoidable. At first Rienzi succeeded in vanquishing the Gaetani by means of John Colonna; he next endeavoured to subvert the Guelph and Ghibelline factions, and to restore Italy to "holy union."

The pope, however, was weary of toleration, and, coming to terms with the nobles, incited them to war. A battle took place in which 80 nobles, chiefs of the Colonna clan, were left dead; the aristocracy never again achieved the rule of the republic. Rienzi's head was turned by this sudden success, and in his great need of money he began to play the tyrant by levying taxes and exacting instant obedience. The papal legate saw his opportunity and seized it, by threatening to bring a charge of heresy against the tribune. Rienzi was dismayed. He declared himself friendly to the pope and willing to respect his authority; and he even sought to conciliate the nobles. At this moment certain Neapolitan and Hungarian captains, after levying soldiers with the tribune's consent, joined the nobles and broke out in revolt. On their proving victorious in a preliminary encounter with some of Rienzi's guards, the tribune suddenly lost heart, resigned the power he had held for seven months, and fled to Naples.

Meanwhile the Romans remained tranquil, intent on making money by the jubilee; but no sooner was this over than disorders broke out and the tyranny of the baronage recommenced. To remedy this state of things, application was made to the pope. He consulted with a committee of cardinals, who sought the advice of Petrarch, and the poet suggested a popular government, to the complete exclusion of the nobles, since these, he said, were strangers who ruined the city. The people had already elected the Thirteen, and now, encouraged by these counsels, on Dec. 26, 1357, chose John Fieschi as head of the commune. But the new leader was unable to withstand the hostilities of the nobles; and in Sept. 1359 Francis Baroncelli was elected tribune. He was a follower of Rienzi, and did little beyond imitating his mode of government and smoothing the way for his return.

Rienzi, after various adventures, was at Avignon in confinement. Innocent VI. (1352-62) decided to send Cardinal Albornoz to Italy, in order to bring the State into subjection to the Church; and he further decided that Rienzi should accompany him to give

him the support of his own popularity in Rome. In fact, directly the pair arrived Baroncelli was overthrown, the supremacy of the senate granted to the pope, and the government confided to Albornoz, who, without concerning himself with Rienzi, nominated a senator. Rienzi, profiting by his prestige and the apparent favour of the pope, was able to collect a band of 500 soldiers of mixed nationalities and on Aug. 1, 1354, took possession of the government. But his money ran short, and he resorted to violence to fill his purse. The result was a sudden revolt on Oct. 8, when the people stormed the capital with cries of "Death to the traitor!" Rienzi was killed.

Foreign Senators and the Banderesi.—Rome submitted to the pontiff, and the pope, instead of two senators, hastened to name a single one of foreign birth. This was a shrewd device of Albornoz and another blow to the nobles, with whom he was still at war. Thus was inaugurated, in 1358, a series of foreign senators, fulfilling the functions of a podesta, and changed every six months together with their staff of judges, notaries, and knights. The people approved of this reform as being inimical to the nobles and favourable to the preservation of liberty.

Hitherto the senators had been assisted, or rather kept in check, by the 13 representatives of the regions. In 1360 these were replaced by seven reformers, who soon became the veritable chiefs of the republic and were elected by ballot every three months, and the nobles, already shut out from power, were also excluded from the militia, which had been reorganized on the democratic system. Three thousand men, mostly archers, were enrolled under the command of two *banderesi*, with four *antepositi*, or lieutenants, constituting a supreme council of war. And the whole body was styled the "*Felix societas balistrariorum et pavesatorum*." It was instituted to support the reformers and re-establish order in the city and Campagna, to keep down the nobles and defend the republic. It fulfilled these duties with much severity. *Banderesi* and *antepositi* had seats in the special council beside those of the reformers, the gonfaloniers of the companies were seated beside the priors. Later these officials constituted the so-called *signoria dei bandereti*. When in 1362 the nobles made a riot in Rome, the *banderesi* drove them all from the city. The fight became so furious that all Rome was in arms, and even mercenaries were hired. Finally renewed submission was made to the pope.

On the death of Innocent VI. in 1362, an agreement was concluded with his successor, Urban V. (1362-70), who was obliged to give his sanction to the government of the reformers and *banderesi*. And then, Albornoz being recalled in disgrace to Avignon and afterwards sent as legate to Naples, these Roman magistrates were able, with or without the co-operation of the foreign senator, to rule in their own way. They did justice to the nobles by hanging a few more; and they defended the city from the threatening attacks of the mercenaries, who had become Italy's worst foes. It was at this period that the Roman statutes were revised and rearranged in the compilation which has come down to us supplemented by alterations of a later date.

Urban V. Begins to Destroy the Republic.—Urban V. (1362-70), no longer in safety at Avignon, decided to return to Italy. The Romans implored him to do so, and he was urged to it by the Italian *litterati*, with Petrarch at their head. In April 1367 he left Avignon, and, entering Rome on Oct. 16, was given the lordship of the city. He showed much acumen in profiting by the first burst of popular enthusiasm to effect quick and dexterous changes in the constitution of the republic. After naming a senator, he abolished the posts of reformers and *banderesi*, substituting three conservators, or rather a species of municipal council, alone charged with judicial and administrative powers. The 13 leaders of the regions and the consuls of the guilds still sat in the councils, which were left unsuppressed. But all real power was in the hands of the pope, who, in Rome as in his other cities, nominated the principal magistrates. Thus, by transforming political into civil institutions, and concentrating the supreme authority in his own grasp, Urban V. dealt a mortal blow to the liberties of Rome. Yet he felt no sense of security among a people who, after the first rejoicings over the return of the Holy See, were

always on the brink of revolt. Besides, he felt himself a stranger in Italy, and was so regarded. Accordingly, in 1370 he decided to return to France, and died there on Dec. 19.

The Romans retained the conservators, conferring on them the political power of the reformers; they re-established the *bandesieri* and the four *anteposti*. The new French pope, Gregory XI. (1370-78), had to be content with obtaining supremacy over the senate and the possession of the castle of St. Angelo. In Feb. 1376 the Romans nominated John Cenci captain of the people and gave him uncontrolled power over the towns of the patrimony and the Sabine land. The two councils were preserved, and a new magistracy was created, the "Three Governors of the Peace and Liberty of Rome."

Gregory XI. decided in 1376 to return to Rome and entered into a treaty with the republic, which, anxious for his return, promised him the same powers that Urban V. had had. He returned early in 1377, but was not able to get control of the government before his death in the following year. The next pope, Urban VI. (1378-89), whose election and acts provoked the Great Schism (1378-1417), had much trouble, but finally got himself recognized as supreme in Rome by promising a jubilee in 1389. He died before it could take place, and was succeeded by Boniface IX. (1389-1404). The latter was very shrewd. He crowned Ladislaus and by a skilful use of jubilees, of which he celebrated two, succeeded in bringing the city wholly under his power; he also reduced the Colonna to submission.

The next pope, Innocent VII. (1404-6), aided by Ladislaus of Naples, put down a revolt of the people, but had to make a concession that they might elect "seven governors of the liberty of the Roman republic." After Innocent's death King Ladislaus seized Rome, sacked it brutally and held sway over it until his death in 1414. Then the Romans revolted against the Neapolitans, and with the aid of the papal legate established a new government of 13 conservators.

Martin V. Supreme.—When after the Schism Martin V. was elected pope he made peace with Joanna, queen of Naples, who yielded Rome to him. Martin V. reduced the remains of the free Roman government to a mere civil municipality. Following the method of the other despots of Italy, he allowed the old republican institutions to retain their names and forms, their administrative and some of their judicial attributes, while all their political functions were transferred to the new government. Order was re-established and justice rigidly observed. Rome was in ruins; nobility and burghers were equally disorganized, the people unable to bear arms and careless of their rights, while the battered walls of the capitol recorded the fall of two republics.

Eugenius IV. (1431-47) was forced by a revolt to flee from Rome, and then the people re-established the "Seven Governors of Liberty." Later Eugenius recovered control over Rome. Under Nicholas V. (1447-55) there were conspiracies to restore the republic, headed by Stephen Porcari, who attempted to play the part of a Rienzi. He was pardoned the first time, but was executed after a second attempt. After that the Popes ruled Rome. Under Paul II. some scholars were seized on the charge of desiring to re-establish paganism in the republic. Under Sixtus IV. (1471-84) the Colonna were either put to death or made powerless, and the Orsini met the same fate under Alexander VI. (1492-1503). There was still a senator of Rome, whose nomination was entirely in the hands of the pope, still three conservators, and an elected council of 26 citizens. Now and then also a shadowy semblance of a popular assembly was held to cast dust in the eyes of the public, but even this was not for long. All these officials, together with the judges of the capitol, retained various attributes of different kinds. They administered justice and gave sentence. There were numerous tribunals, all with undefined modes of procedure, so that it was very difficult for the citizens to ascertain in which court justice should be sought. But in last resort there was always the supreme decision of the pope. Thus matters remained up to 1789. For Modern City see p. 472.

BIBLIOGRAPHY.—There is a good bibliography for mediaeval Rome in E. Calvi, *Bibliografia generale di Roma* (1906). The more important sources for the history of Rome in the middle ages, as far as they have

been edited, are found in the *Liber Pontificalis*, edit. by Duchesne (1886-92) and by Mommsen, in the *Monumenta Germaniae Historica* (1896); in Baronius, *Annales Ecclesiastici* (best ed. Paris, 1863-82); and in the *Archivio della Reale Società Romana di Storia Patria*. See also Watterich, *Pontificum romanorum*, etc. (1884); Kuhn, *Regesta pontificum*, etc. (1896). For the period 568-753 there is a good bibliography in C. Diehl, *Études sur l'administration byzantine* (1888); for 751-1252, in L. Halphen, *Études sur l'administration de Rome au moyen âge* (1907); for 1354-1471, in E. Rodocanachi, *Histoire de Rome* (1921). Each of these three books also has a bibliography of secondary works. Duchesne's *Les premiers temps de l'État pontifical, 754-1073* (1898) has corrected many errors formerly held. Older books which are still valuable are: Savigny, *Geschichte des römischen Rechts im Mittelalter*; J. Ficker, *Forschungen zur Reichs- und Rechtsgeschichte Italiens* (Innsbruck, 1868-74); F. Papenort, *Geschichte der Stadt Rom* (Paderborn, 1857); A. von Baumont, *Geschichte der Stadt Rom*, (1867-68). F. Gregorovich, *Geschichte der Stadt Rom* is a standard work and very interesting. It was finished in 1872 and consequently needs correction on many points. There is a fifth edition in German (Stuttgart, 1903 seq.) and an English translation, from the fourth edition, by Annie Hamilton (1894 seq.). P. Villari, *I comuni di Roma nel medio evo*, in his *Saggi storici e critici* (Bologna, 1890) is a "brilliant essay"; cf. also his *Medieval Italy from Charlemagne to Henry VII.* (1910). Camillo Re, *Statuti della città di Roma* (1880) prints the statutes, with a long introduction; cf. G. Gatti, *Statuti dei mercanti di Roma* (1885). For the time of Innocent III., A. Luchaire, *Innocent III., Rome et l'Italie* (1904); cf. his article in *Revue Historique*, vol. 81 (1903). For Brancalone, M. Rovere, *Brancalone degli Andalò* (Udine, 1895). For the 14th and 15th centuries, the work of Rodocanachi, cited above, and also his *Les institutions communales de Rome* (1901), which is better for this later period than for the earlier ages. Hartmann Grisar S.J., announced a very elaborate work on the history of Rome and the popes in the middle ages, only the first volume, in German, was published (1890-1901, Eng. trans. 1911 seq.). O. Rössler, *Grundriss einer Geschichte Roms im Mittelalter* (1909) is useful. See also the two series *Storia politica d'Italia*, one written by a *Società di professori* and the other by a *Società d'amici*, in which appeared the following useful volumes: G. Romano, *Dominationi barbariche 395-1024* (1909); F. Bertolini, *Dominationi germaniche* (1872); F. Lanzani, *Comuni* (1881); C. Cipolla, *Signorie italiane* (1881) (all published at Milan). Some material is to be found in M. Creighton, *History of the Papacy* (2nd. ed., 1897) and in L. Pastor, *Geschichte der Päpste* (Leipzig, 1884 seq.), of which there is an English translation (St. Louis, 1888 seq.). A. Stein, *Medieval Rome* (1902) in the *Story of the Nations* series. (D. C. M.; X.)

ROME, a city of Georgia, U.S., the county seat of Floyd county; 70 mi. N.W. of Atlanta, at the confluence of the Etowah and the Oostanaula rivers to form the Coosa. It is served by the Central of Georgia and the Southern railways and by air and bus lines. Population 29,677 in 1930 and 26,282 in 1940 by the federal census. The city has a beautiful location (650 to 1,500 ft. above sea level) on hills and surrounded by pine-clad ridges and cultivated valleys. Rome is an important cotton market and an industrial center producing a wide variety of products. Shorter college (for women) is located there, and the Berry schools and colleges (industrial, for boys and girls). The city has a commission-manager form of government. Ferdinand de Soto camped for a month on the site of Rome in 1540. It was in the territory of the Cherokee nation, and there Gen. John Sevier in Oct. 1793 defeated a band of marauding Indians. The city was founded in 1834 and chartered in 1847. Its name was chosen by lot from several proposed by the four founders. In 1863 there were brilliant cavalry manoeuvres in the vicinity, resulting in the capture (on May 3) of 1,600 Union soldiers by Gen. Nathan B. Forrest with only 410 Confederates. On May 19, 1864, the city was taken by a detachment of Gen. W. T. Sherman's army. Before the Civil War Rome was an important river port.

ROME, a city of Oneida county, N.Y., U.S., 15 mi. N.W. of Utica, on the Mohawk river, Wood creek and the State Barge canal; served by the New York Central and the New York, Ontario and Western railways. Pop. (1950) 41,379; 1940 federal census 34,214. The city lies at an altitude of 450 ft., on a level stretch between the river and the creek, which flow respectively into the Hudson river and through Oneida lake and the Oswego river into Lake Ontario. It is an important manufacturing city, with great brass and copper mills which employ three-fifths of the workmen of the city. About one-tenth of all the copper fabricated in the United States is made there. The retail district of Rome stands on the old portage between the Mohawk river and Wood creek (about 1 mi. apart), which was used from

time immemorial by the Indians and for nearly two centuries by the Dutch and English traders. To protect it Fort Bull was built on Wood creek and Fort Williams on the Mohawk by the British in 1755. The former was taken by French and Indians in March 1756, and the latter was destroyed by British Gen. Daniel Webb after the reduction of Oswego by the French in August of the same year. In 1758 Fort Stanwix was erected by British Gen. John Stanwix at a cost of £60,000. There in Oct.-Nov. 1758 Sir William Johnson and representatives of Virginia and Pennsylvania met with 3,200 Indians of the Six Nations and made a treaty with them, under which, for £10,460 in money and goods, they surrendered to the crown their claims to what is now Kentucky, West Virginia and western Pennsylvania. The fort was dismantled immediately afterward. In 1776 it was rebuilt and renamed in honour of Gen. Philip Schuyler, but the old name clung to it in popular usage. On Aug. 2, 1777, Fort Schuyler, containing about 750 continental troops, under Col. Peter Gansevoort and Lieut. Col. Marinus Willett, was besieged by Col. Barry St. Leger's British forces coming from the west. On Aug. 6 Gen. Nicholas Herkimer, with about 800 patriot militia, on his way to the relief of the fort, was ambushed by St. Leger's Tories and Indians in the forest near Oriskany (q.v.), 6 mi. E. During the action Willett, with 250 men and a small cannon, made a sortie from the fort, drew off a part of the enemy from Herkimer (so that he, though mortally wounded, was able to conduct the remnant of his force in orderly retreat down the valley) and brought back much booty. On Aug. 23 St. Leger, hearing exaggerated reports of reinforcements approaching under Gen. Benedict Arnold, withdrew from the siege. The successful resistance to St. Leger contributed greatly to the American success at Saratoga. It was during the investment of Fort Schuyler (or Stanwix) on this occasion that the Stars and Stripes was first raised (early Sunday morning on Aug. 3, 1777) in the face of an enemy. The making of it (from bits of clothing of members of the garrison) "taxed the invention of the garrison," Colonel Willett records, but "a decent one was soon contrived." In 1799 Fort Schuyler was the headquarters of Col. Gozen van Schaick when he destroyed the Onondaga villages; and on Oct. 22, 1784, a treaty was concluded there by three commissioners representing the U.S. and the chiefs of the Six Nations. In 1796 the township of Rome was organized, receiving its name "from the heroic defense of the republic made here." In 1817 the first earth was turned at Rome for the Erie canal. The village of Rome was incorporated in 1819 and in 1870 it was chartered as a city.

ROMFORD, a market town, municipal borough and residential centre in the Romford parliamentary division of Essex, England, 12½ mi. E.N.E. from London by the L.N.E.R., also served by the L.M.S.R. Pop. (1938) 54,600. Area, 14.6 sq.mi. Romford has ironworks and electrical engineering works. It was incorporated in 1937. Gidea Park, which includes Hare Street village, was developed as a garden suburb.

ROMILLY, SIR SAMUEL (1757-1818), English legal reformer, second son of Peter Romilly, came of a Huguenot family that migrated to England. Samuel Romilly was born in Friar street, Soho, on March 1, 1757. He entered at Gray's Inn in 1778 and was called to the bar in 1783; his practice was mainly on the chancery side. In 1784 he became friendly with Mirabeau, and later supplied him with an account of house of commons procedure for use in France. As a result of a visit to France he published in 1790 *Thoughts on the Probable Influence of the Late Revolution*. He married in 1798. In 1800 he became a K.C., and in 1806 he was solicitor-general in the Ministry of All the Talents, sitting as M.P. for Queenborough. Sir Samuel Romilly then commenced his attempt to reform the criminal law of England, then cruel and illogical. He had already published *Observations* on the subject. By statute law innumerable offenses were punishable by death, but, as wholesale executions would be impossible, the larger number of those convicted and sentenced to death at every assizes were respited, after having heard the sentence of death solemnly passed upon them. This led to many acts of

injustice, as the lives of the convicts depended on the caprice of the judges, while at the same time it made the whole system of punishments and of the criminal law ridiculous. In 1808 Romilly managed to repeal the Elizabethan statute, which made it a capital offense to steal from the person. This success, however, raised opposition, and in the following year three bills repealing equally sanguinary statutes were thrown out by the house of lords under the influence of Lord Ellenborough. Year after year the same influence prevailed, and Romilly saw his bills rejected; but his patient efforts and his eloquence ensured victory eventually for his cause by opening the eyes of Englishmen to the barbarity of their criminal law. The only success he had was in securing the repeal, in 1812, of a statute of Elizabeth making it a capital offense for a soldier or a mariner to beg without a pass from a magistrate or his commanding officer. Lady Romilly died on Oct. 20, 1818, and Sir Samuel committed suicide on Nov. 2. See the *Memoirs of the Life of Sir Samuel Romilly*, written by himself, with a selection from his correspondence, edited by his Sons (3 vols., 1840); *The Speeches of Sir Samuel Romilly in the House of Commons* (2 vols., 1850); "Life and Work of Sir Samuel Romilly," by Sir W. J. Collins, in *Trans. of the Huguenot Society* (1908).

ROMMEL, ERWIN (1891-1944), general field marshal of the German army during World War II, was born in Swabia in 1891 and was educated for military service at Stuttgart. During World War I, at that time a lieutenant, he served in the German army, taking part in numerous battles and campaigns and winning the Prussian Order pour le Mérite for distinguished service in the first battle of Champagne. After the war he attended the University of Tübingen for a time, but with Hitler's rise to power became a member of the National Socialist party and, according to some authorities, was at one time head of the S.S., Hitler's elite guard. During Hitler's invasions of central Europe he was ordered from his teaching position at the Potsdam war college to serve successively as commandant of field headquarters in Austria, the Sudetenland and Poland. In 1940, the tank divisions under his command played a substantial part in the German victory in France, and in 1941 he was placed in charge of the German Afrika Korps, then fighting in Libya. By the middle of 1942 he had retaken from the British the strategically important seaport town of Tobruk and driven the British 8th army back to El Alamein, Egypt. The British counter-attack in Nov. 1942, and Rommel's army was driven back to Tunisia and eventual surrender (May 1943). Rommel returned to Germany in March 1943, was made inspector-general of Germany's defenses, Jan. 1944, and was in command of the mechanized army which opposed the Allied invasion in Normandy. His death was announced Oct. 14.

ROMNEY, GEORGE (1734-1802), English historical and portrait painter, was born at Dalton-in-Furness, Lancashire, on Dec. 26, 1734. His father was a builder and cabinet-maker, and the son, having manifested a turn for mechanics, was instructed in the latter craft, executing carvings of figures in wood, and constructing a violin, which he spent much time in playing. He was also busy with his pencil; and some of his sketches having attracted attention, his father apprenticed the boy, at the age of 19, to Steele, an itinerant painter of portraits and domestic subjects who had studied in Paris under Vanloo. In 1756 Romney married a young woman who had nursed him through a fever, and started as a portrait painter on his own account, travelling through the northern counties, executing likenesses at a couple of guineas, and producing a series of some 20 figure compositions, which were exhibited in Kendal, and afterwards disposed of by a lottery.

Having, at the age of 27, saved about £100, he left a portion of the sum with his wife and family, and started to seek his fortune in London, never returning, except for brief visits, till he came, a broken-down and aged man, to die. In London he rapidly rose into popular favour. His "Death of General Wolfe" was judged worthy of the second prize at the Society of Arts, but a word from Reynolds in praise of Mortimer's "Edward the Confessor" led to the premium being awarded to that painter, while Romney had to content himself with a donation of £50, an incident which led to the subsequent coldness between him and the president and prevented him from exhibiting at the academy or presenting himself for its honours.

In 1764 he paid a brief visit to Paris, where he was befriended by Joseph Vernet; and his portrait of Sir Joseph Yates, painted on his return, bears distinct traces of his study of the works of Rubens then in the Luxembourg palace. In 1766 he became a member of the Incorporated Society of Artists, and three years later he seems to have studied in their schools. He removed to Great Newport street, near the residence of Sir Joshua, whose fame in portraiture he began to rival in such works as "Sir George and Lady Warren" and "Mrs. Yates as the Tragic Muse"; and his professional income rose to £1,200 a year. But this marked increase in his popularity had the effect of enlarging his ambitions. Realizing the need for more thorough knowledge, he was seized with a longing to study in Italy; and in the beginning of 1773 he started for Rome with Ozias Humphrey, the miniature painter. On his arrival he devoted himself to study, raising a scaffold to examine the paintings in the Vatican, and giving much time to work from the undraped model, of which his painting of a "Wood Nymph" was a result. At Parma he studied Correggio.

In 1775 Romney returned to London, establishing himself in Cavendish square, and resuming his work as a portrait painter. The admiration of the town was divided between him and Reynolds. Romney became acquainted with Hayley, his future biographer, then in the zenith of his popularity as a poet. His influence on the painter seems to have been far from salutary. He encouraged Romney's excessive and morbid sensibility, and tempted him to expend his talents on ill-considered, seldom-completed paintings of ideal and poetical subjects. About 1783 Romney was introduced to Emma Hart, afterwards celebrated as Lady Hamilton, and she became the model from whom he worked incessantly. He painted her as a Magdalene and as a Joan of Arc, as a Circe, a Bacchante, a Cassandra; and he confessed that she was the inspirer of what was most beautiful in his art. But her fascinations had their share in aggravating that nervous restlessness and instability, inherent in his nature, which finally ruined both health and mind.

In 1786 Alderman Boydell started his great scheme of the Shakespeare gallery, apparently at the suggestion of Romney. The painter entered heartily into the plan, and contributed his scene from the *Tempest*, and his "Infant Shakespeare attended by the Passions," the latter characterized by the Redgraves as one of the best of his subject pictures. Gradually he began to withdraw from portrait painting, to limit the hours devoted to sitters, and to turn his thoughts to mighty schemes of the ideal subjects which he would execute. Already, in 1792, he had painted "Milton and his Daughters," which was followed by "Newton making Experiments with the Prism." He was to paint the Seven Ages, Visions of Adam with the Angel, "six other subjects from Milton—three where Satan is the hero, and three from Adam and Eve,—perhaps six of each." Having planned and erected a large studio in Hampstead, he removed thither in 1797, with the fine collection of casts from the antique which his friend Flaxman had gathered for him in Italy. But his health was now irremediably shattered. In the summer of 1799, suffering from great weakness of body and depression of mind, he returned to Kendal, where his faithful and long-suffering wife received and tended him. He died on Nov. 15, 1802.

See the *Memoirs* by William Hayley (1803) and by the artist's son, the Rev. John Romney (1830). In the fully illustrated *George Romney*, by Lord Ronald Sutherland Gower (1904), pictures, mainly studies, are reproduced not elsewhere to be found. But the great work upon the artist is *Romney*, by Humphry Ward and W. Roberts (1904), containing 70 illustrations, a biographical and critical essay, and a *catalogue raisonné* of the painter's works. See also Arthur B. Chamberlain, *Romney* (1910).

ROMNEY, HENRY SIDNEY, EARL OF (1641-1704), fourth son of Robert, 2nd earl of Leicester, was born in Paris in 1641. Sidney's handsome face helped his advancement at court, but the favour in which he was held by the duchess of York, to whom he was master of the robes, led to his temporary disgrace. In 1672 he was sent on a mission of congratulations to Louis XIV, and in 1677 became master of the robes to Charles II. He entered parliament in 1679, and became a close political ally of his nephew Sunderland, with whose wife he carried on an intrigue which

caused scandal. Sunderland used this intimacy to further his political ends. Sidney was sent by Sunderland and others in 1679 on a special mission to urge William of Orange to visit England, a task which he discharged while acting as the official envoy of Charles II at The Hague. He was recalled in 1681, but was again sent to Holland in 1685. He returned to England in the spring of 1688, and sought support for the prince of Orange in the event of his landing. He was allowed to leave England on giving his word not to visit The Hague, but he broke his promise on getting clear of England, and conveyed to William a duplicate of the invitation addressed to him by the English nobility, together with intelligence of affairs of state obtained through the countess of Sunderland.

He landed with William at Torbay, and received substantial rewards for his undoubted services, including the titles of Baron Milton and Viscount Sidney of Sheppey. William made him secretary of state in 1690, and in 1692, lord-lieutenant of Ireland. His inability to cope with the difficulties of this position led to his recall in the next year, when he became master-general of the ordnance. He was created earl of Romney in May 1694. On Anne's accession he was dismissed from his various offices. His titles became extinct on his death on April 8, 1704.

ROMNEY (Kent, England): see NEW ROMNEY.
ROMORANTIN, a town of central France, in the department of Loir-et-Cher, 31 mi. S.E. of Blois by rail. Pop. (1936) 7,130. In 1560 Romorantin gave its name to an edict which prevented the introduction of the Inquisition into France. The town stands on the Saultre at its confluence with the Morantin, whence its name (*Rivus Morantini*).

ROMSDAL, the valley of the river Rauma, in Norway. The Rauma is a torrent with several waterfalls (Mongefos, Vaermafos and Slettafos) which descends from Lake Lesjegan to the Romsdal fjord on the west coast (62° 30' N.). The nearest port is Molde, from which steamers run to Vefsnegnaes (30 mi.) at the foot of the valley. A good road traverses the valley, which is one of the finest in southern Norway, flanked by steep mountains terminating in abrupt peaks—Vengeitinder (5,960 ft.), Romsdalshorn (5,105), Trøldtinder ("witch-peaks," 6,010) and others. Lake Lesjegan also drains from the opposite end by the Laagen or Lougen river to the Glommen, and so to the Skagerrak, and the road follows its valley, the Gudbrandsdal.

ROMSEY (rūm'zī), market town and municipal borough in the New Forest and Christchurch parliamentary division of Hampshire, England, 7 mi. N.W. of Southampton by the S.R. Pop. (est. 1938) 5,730. Area, 1.9 sq.mi. The abbey church of SS. Mary and Eilfeda is a fine Norman church little altered by later builders. A house founded there by Edward the Elder (c. 910) became a Benedictine nunnery. The church, which is the only important relic of the foundation, is cruciform, with a low central tower. Building began in the first half of the 12th century, and continued through it, as the western part of the nave shows the transition to the Early English style, which appears in the west front. Decorated windows occur in the east end, beyond which a chapel formerly extended. Perpendicular insertions are insignificant. The nave and choir have aisles, triforium and clerestory. The transepts have eastern apsidal chapels, as have the choir aisles, though the walls of these last are square without. Foundations of the apse of a large pre-Norman church have been discovered below the present building. At the time of the Domesday Survey Romsey (Romesy, Romesie) was owned by the abbey, which continued to be the overlord until the dissolution. Romsey was incorporated by James I in 1608. In mediaeval times the town had a considerable share of the woolen trade of Hampshire, but it declined in the late 17th century.

ROMULUS, the son of Mars by the Vestal Rhea Silvia or Ilia, daughter of Numitor, who had been dispossessed of the throne of Alba by his younger brother Amulius. Romulus and Rémus, the twin sons of Silvia, were placed in a trough and cast into the Tiber by their grand-uncle. The trough grounded in the marshes where Rome afterwards stood, under the wild fig tree (*Ficus ruminalis*), which was still holy in later days. The babes were suckled by a she-wolf and fed by a woodpecker, and

then fostered by Acca Larentia, wife of the shepherd Faustulus. They became leaders of a warlike band of shepherds on the Palatine, and in course of time were recognized by their grandfather, whom they restored to his throne, slaying Amulius. They now founded a city on the site where they had been nurtured; later a quarrel broke out and Remus was slain. Romulus strengthened his band by offering an "asylum" to outcasts and fugitives, found wives for them by capture and waged war with their kinsmen. His most formidable foe was Titus Tatius (q.v.), king of the Sabines, but after an obstinate struggle he and Romulus united their forces and reigned side by side till Tatius was slain at Lavinium in the course of a blood-feud with Laurentum. Romulus then reigned alone till he suddenly disappeared in a storm. He was thereafter worshipped as a god under the name of Quirinus. Various rationalizing accounts also exist of the legend.

The whole story, probably first given by the annalists Fabius Pictor and Cincius Alimentus, is artificial and shows strong Greek influence. The birth, exposure, rescue, and subsequent adventures of the twins are a Greek tale of familiar type. Mars and his sacred beast, the wolf, are introduced on account of the great importance of this cult. The localities described are ancient sacred places; the Lupercal, near the *lucus ruminalis*, was naturally explained as the she-wolf's den. (See *Rome: The Ancient City*.) The *asylum* is pure Greek, both name and institution. The story was probably invented to give an explanation of the sacred spot named *inter duos lucos* between the arx and the Capitol. Another Greek touch is the dedication of an eponymous hero. The rape of the Sabine women is clearly aetiological, invented to account for the custom of simulated capture in marriage; these women and also Titus Tatius represent the Sabine element in the Roman population. The name Romulus (= *Romanus*, cp. the forms *Siculus* and *Sticulus*) means simply "Roman," the derivation of Remus is obscure.

Romulus is regarded as the founder of the military and political institutions (see *Rome*), as Numa and his counterpart Ancus Marcius are of the religious institutions, of Rome.

Seeley, Introduction to his edition of Livy, bk. E. *Fals Storia di Roma* (1898), I. pt. 2, and *Ancient Legends of Roman History* (Eng. trans., 1908); J. B. Carter in Roscher's *Lexikon*, art. Romulus.

ROMULUS AUGUSTULUS, last Roman emperor of the West (Oct. 31, A.D. 475, to Sept. 4, 476), was elevated to the throne by his father, Orestes, "master of the soldiery" (Jordanes), who drove the emperor Julius (Nepos) to Dalmatia in the summer of 475. Romulus, who was then probably about 14 years old, owed his first name to an uncle, a *comes* of Patavio in Noricum; his nickname he probably owed to the barbarian soldiery; and by these two chances the last emperor successor of a Julius Caesar bore the names both of the first emperor and the first king. The reins of power were naturally held for him by his father, Orestes, nor is there any event of his reign worthy of record except the conclusion of peace with Gaiseric the Vandal. Shortly after his elevation to the throne, the barbarian mercenaries in the service of Rome presented to Romulus's father, Orestes, a demand that they should be allotted one-third of the lands of all Italy. With a last flicker of Roman courage and pride, Orestes refused: the mercenaries revolted under their leader and instigator, Odoacer (Aug. 23, 476), and in a very short while Orestes was defeated and beheaded and the Western empire came to an end. The victorious Odoacer was touched by the beauty and helplessness of Romulus, and spared his life, ordering him to retire to the villa built by Lucullus four centuries before, near Naples. Here he died at a date unknown to us.

RONALDSHAY, LAWRENCE JOHN LUMLEY DUNDAS, Esq., or (1876-), British administrator, was born June 11, 1876, the eldest surviving son of the 1st Marquess of Zetland and was educated at Harrow and Trinity College, Cambridge. From 1898-1907 he travelled extensively in Ceylon, India, Persia, Asiatic Turkey, Central Asia, Siberia, Japan, China and Burma. In 1900 he was appointed aide-de-camp to the staff of the viceroy, Earl Curzon, in India. He sat in the House of

Commons as Conservative member for the Hornsey division from 1907 to 1916. He was a member of the royal commission on the public services in India, 1912-14, and governor of Bengal, 1916-22, when he was created G.C.S.I. He succeeded to the marquessate of Zetland in 1939. Ronaldshay was secretary of state for India, 1935-40, and, in addition, for Burma, 1937-40.

Lord Ronaldshay published *Sport and Politics under an Eastern Sky* (1902); *On the Outskirts of Empire in Asia* (1904); *A Wandering Student in the Far East* (1908); *An Eastern Miscellany* (1911); *Lands of the Thunderbolt: Sikhim, Chumbi and Bhutan* (1923); *The Heart of Argyararia* (1925); *Life of Lord Curzon of Kedleston*, 3 vol. (1927-28); *Steps Towards Indian Home Rule* (1931).

RONCESVALLES (Fr. *Roncevaux*), a village of northern Spain, in the province of Navarre; situated on the small river Urrobi, at an altitude of 3,220 ft. among the Pyrenees, and within 5 mi. from the French frontier. Pop. (1940) 149. Roncesvalles is famous in history and legend for the defeat of Charlemagne and the death of Roland in 778. The small collegiate church contains several relics associated with Roland, and is a favourite place of pilgrimage. The battle is said to have been fought in the picturesque valley known as Valcarlos, which is now occupied by a hamlet (pop. in 1940, 303; mun., 970) bearing the same name, and in the adjoining hills of Ibañeta. Both of these are traversed by the main road leading north from Roncesvalles to St. Jean Pied de Port, in France.

RONDA, a town of southern Spain, in the province of Málaga; on the river Guadiaro and on the Algeciras-Bobadilla railway. Pop. (1940) 15,813 (mun., 26,170). Ronda is built on a high rock nearly surrounded by the Guadiaro or Guadalevín,

A RONDA MILKMAN MILKING HIS GOAT FOR A CUSTOMER

which flows through an abrupt chasm 530 ft. deep and 300 ft. wide, by which the old town is separated from the new. The stream was probably bridged by the Romans. Ronda has a considerable trade in leather, saddlery, horses, soap, flour, chocolate, wine and hats. The poet Vicente Espinel was born here in 1555.

Some remains of an aqueduct and theatre, about 7 mi. N. of Ronda, are supposed to represent the *Acinipo* or *Arunda* of ancient geographers. Ronda gives its name to the Sierra or Serranía de Ronda, one of the main sections of the coast mountains which rise between the great plain of Andalusia and the Mediterranean.

RONDEAU, a structural form in poetry and (in the form of "rondeau") in music. In poetry the rondeau is a short metrical structure which in its perfect form consists of 13 eight- or ten-syllabled verses divided into three strophes of unequal length, and knit together by two rhymes and a refrain. In Clement Marot's time the laws of the rondeau were laid down, and, according to Voiture, in the 17th century, the following was the type of the approved form of the rondeau:—

"Ma foy, c'est fait de moy, car Isabelle
M'a conjuré de luy faire un Rondeau:
Cela me met en une peine extrême.
Quoy treize vers, huit en eau, cinq en éme.
Je luy ferois aussi-tôt un bateau!

En voilà cinq pourtant en un monceau:
Faisons en huit, en invoquant Brodeau.
En puis mettons, par quelque stratagème,
Ma foy, c'est fait!

Si je pouvois encore de mon cerveau
Tirer cinq vers, l'ouvrage seroit beau;
Mais cependant, je suis dedans l'ennème,
Et si je croy que je fais le douzième,
En voilà treize ajustés au niveau.
Ma foy, c'est fait!"

All forms of the rondeau are alike in this, that the distinguishing metrical emphasis is achieved by a peculiar use of the refrain. Though we have a set of rondeaux in the *Rolliad* (written by Dr. Lawrence the friend of Burke, according to Gosse), it was not till modern times that the form had any real vogue in England.

Considerable attention, however, has lately been given in England to the form. Some English rondeaux are as bright and graceful as Voiture's own. Swinburne, who in his *Century of Rondels* was perhaps the first to make the refrain rhyme with the second verse of the first strophe, has brought the form into high poetry. In German, rondeaux have been composed with perfect correctness by Weckherlin, and with certain divergences from the French type by Götz and Fischart; the German name for the form is *rundum* or *ringel-gedicht*.

Although the origin of the refrain in all poetry was no doubt the improvisator's need of a rest, a time in which to focus his forces and recover breath for future flights, the refrain has a distinct metrical value of its own; it knits the structure together, and so intensifies the emotional energy, as we see in the Border ballads, in the *Oriana* of Lord Tennyson, and in the *Sister Helen* of Rossetti. The suggestion of extreme artificiality—of "difficultly overcome"—which is one great fault of the rondeau as a vehicle for deep emotion, does not therefore spring from the use of the refrain, but from the too frequent recurrence of the rhymes in the strophes—for which there is no metrical necessity as in the case of the Petrarchan sonnet. The rondeau is, however, an inimitable instrument of gaiety, delicacy, colour and grace.

RONDEL, a form of verse closely allied to the rondeau (*g.v.*) but distinguished from it by containing 14 instead of 13 lines, and by demanding a slightly different arrangement of rhymes. The initial couplet is repeated in the middle and again at the close. The arrangement of rhymes is as follows: a, b, b, a; a, b, a, b; a, b, b, a, a, b. This form, which was invented in the 14th century, was largely used in later mediaeval French poetry, but particularly by Charles d'Orléans (1391-1465), the very best of whose graceful creations are all rondels. The rondel, in French, may begin with either a masculine or a feminine rhyme, but its solitary other rhyme must be of the opposite kind.

One of the Prince d'Orléans' rondels may be given here as a type:—

Le temps a laissé son manteau
De vent, de froidure et de pluie,
Et s'est vestu de brouillade
De soleil luisant, cler et beau.
Il n'y a beste ne oiseau
Qu'en son jargon ne chante ou crie;
Le temps a laissé son manteau
De vent, de froidure et de pluie.
Rivière, fontaine et ruisseau
Portent, en livrée jolie,
Gouttes d'argent d'or faverie;
Chacun s'habille de nouveau;
Le temps a laissé son manteau
De vent, de froidure et de pluie.

Rondels existed in English from the 15th century, but the early specimens of it are very clumsy. It was revived in the 19th century. Correct examples are found in the poems of Robert Bridges, Dobson, Gosse and Henley. The following, by Austin Dobson, is a good example of what an English rondel should be in all technical respects.

Love comes back to his vacant dwelling,—
The old, old Love that we knew of yore!
We see him stand by the open door,
With his great eyes sad, and his bosom swelling.
He makes as though in our arms repelling
He fain would lie as he lay before:—
Love comes back to his vacant dwelling,—
The old, old Love that we knew of yore!
Ah! who shall help us from over-spelling
That sweet, forgotten, forbidden lore?
E'en as we doubt, in our hearts come more,
With a rush of tears to our eyelids welling,
Love comes back to his vacant dwelling,
The old, old Love that we knew of yore!

Théodore de Banville remarks that the art of the rondel consists in the gay and natural reintroduction of the refrain, which should always seem inevitable, while slightly changing the point of view of the reader. If this is not successfully achieved, "on ne fera que de la marqueterie et du placage, c'est-à-dire, en fait

de poésie,—rien!" In Germany, the rondel was introduced, in the 18th century, under the name of *ringel-gedicht* by Johann Nikolaus Götz (1731-81).

RONDO, a musical form originally derived from the rondel in verse; as may be seen, long before the development of instrumental forms, in some of the *chansons* of Orlando di Lasso. The *rondeau en couplets* of Couperin and his contemporaries shows the same connection with verse. It consists of a single neatly rounded phrase alternating with several episodes (*the couplets*) without any important change of key. Ex. 1 shows Bach's handling of this early form. The later rondo is an important member of the sonata forms (*g.v.*), chiefly found in finales; but rondo-form sometimes occurs in slow movements. Ex. 2 is not more elaborate than the adagio of Beethoven's 4th symphony. Philipp Emanuel Bach invented an extraordinary kind of rondo, not part of a sonata, but on a voluminous scale with wildly incoherent episodes and modulations.

The later sonata-style rondo forms may be divided into two main classes:

(i.) *Sectional rondos*; i.e., with little or no development or transition between the episodes and the main theme; very characteristic of Haydn, who, however, may run away with it in unexpected developments. The name rondo implies at least two episodes, and a sectional rondo may have more. Beethoven in his early works shows the influence of Haydn in this type of rondo; e.g., the finales of sonatas, opp. 10, No. 3, and 14, Nos. 1 and 2; and the slow movements of the sonatas, opp. 2, No. 2, and 13 (*Pastorale*). The sectional rondo last appears on a gigantic scale in the finale of Brahms's G minor pianoforte quartet, op. 25; and it lends itself, like the cognate idea of a dance with several "trios" to Schumann's pianoforte pieces and to some of his finales.

(ii.) *Rondos influenced by the form of a first movement* (for which see *SONATA FORMS*). In the normal scheme for this, which is Mozart's favourite rondo-form, the rondo-theme (which may contain several clauses) is followed by a well-organized transition to the key of the first episode, which key is chosen as if for the "complementary key" of a first movement. The return to the rondo-theme may be elaborate or abrupt, and the theme itself may be reduced to its first complete clause (but not to a mere fragment, without loss of the rondo effect). The second episode will be in a new key and may be followed by wide modulations, or itself be widely modulatory, or it may even be entirely a development of the previous material, as in the rondo of Beethoven's Sonata Op. 90, given on p. 525. When the rondo-theme returns again it is followed by a recapitulation of the first episode (perhaps preceded by the transitional passage suitably modified) in the tonic; after which the coda may contain a final return of the rondo-theme. When the second episode is concentrated on development the only difference between the rondo and a first movement is the slender fact that the whole first theme returns immediately after the first episode. Yet the rondo style can be recognised from the outset by the tunelike character of the main theme, and also by the fact that, unlike the most tuneful openings of first movements, it comes to a definite close instead of swinging continuously into the transition passage. A rondo with a development in its middle episode may return to the tonic with an immediate recapitulation of the first episode, omitting the expected second return of the main theme, thus: A, B (new key), A, C (development), B (tonic), A, Coda (where A is the rondo-theme and B and C the episodes). Mozart, Schubert and Brahms have a form, always worked on a very large scale, which consists only of A, B (new key), A, B (tonic), Coda; where a certain amount of development is edged in *à propos* of the transition-passage on its recapitulation. Only the style of the main theme can distinguish this from a first movement that omits its normal development-section.

In the rondos of classical concertos (*g.v.*) the orchestra (especially in Mozart) finds its opportunity in a series of accessory themes announced as soon as the solo instrument has given out the rondo-theme. These accessories are then held in reserve for the coda.

Two examples of rondo-forms are given on pp. 524-6:—

RONSARD, PIERRE DE (1524-1585), French poet and "prince of poets" (as his own generation in France called him), was born at the Château de la Poissonnière, near the village of Couture in the province of Vendômois (department of Loir-et-Cher), on Sept. 11, 1524. His family is said to have come from the Slav provinces to the south of the Danube (provinces with which the crusades had given France much intercourse) in the first half of the 14th century. Pierre was the youngest son of Loys de Ronsard, *maître d'hôtel du roi* to Francis I. Pierre was sent to the Collège de Navarre at Paris when he was nine years old. It is said that the rough life of a mediaeval school did not suit him. He was quickly appointed page, first to the king's eldest son François, and then to his brother the duke of Orleans. When Madeleine of France was married to James V. of Scotland, Ronsard was attached to the king's service, and he spent three years in Great Britain. The latter part of this time seems to have been passed in England, though he had, strictly speaking, no business there. On returning to France in 1540 he was again taken into the service of the duke of Orleans, and travelled to Flanders and again to Scotland. After a time he was attached as secretary to the suite of La Roche de Baif, the father of his future colleague in the Pléiade and his companion on this occasion, Antoine de Baif, at the diet of Spire. Afterwards he was attached in the same way to the suite of the cardinal du Bellay-Langey. His diplomatic career was cut short by an attack of deafness which no physician could cure, and he devoted himself to study at the Collège Coqueret, the principal of which was Daurat—afterwards the "dark star" (as from his silence he has been called in France) of the Pléiade, and already an acquaintance of Ronsard's from his having held the office of tutor in the Baif household. Antoine de Baif, Daurat's pupil, accompanied Ronsard; Belleau shortly followed; Joachim du Bellay, the second of the seven, joined not much later. Muretus (Marc Antoine Muret), a great scholar and by means of his Latin plays a great influence in the creation of French tragedy, was also a student here.

The Pléiade—Ronsard's period of study occupied seven years, and the first manifesto of the new literary movement, which was to apply to the vernacular the principles of criticism and scholarship learnt from the classics, came not from him but from Joachim du Bellay (*q.v.*). The *Défense et illustration de la langue française* of the latter appeared in 1549, and the Pléiade (or *Brigade*, as it was first called) may be said to have been then launched. The orthodox canon is beyond doubt composed of Ronsard, Du Bellay, Baif, Belleau, Pontus de Tyard, Jodelle the dramatist, and Daurat. Some single and minor pieces, an epithalamium on Antoine de Bourbon and Jeanne de Navarre (1550), a "Hymne de la France" (1549), an "Ode à la Paix," preceded the publication in 1550 of the first four books of the *Odes* of Ronsard. This was followed in 1555 by his *Amours de Cassandre* with the fifth book of *Odes*. These books excited a violent literary quarrel. Marot was dead, but he left a numerous school, some of whom saw in the stricter literary critique of the Pléiade, in its outspoken contempt of merely vernacular and mediæval forms, in its strenuous advice to French poetry to "follow the ancients," and so forth, an insult to Marot and his followers. An acute rivalry ensued between the followers of Clément Marot. The

"École Marotique," and the new school. The Pléiade found a powerful supporter at court in Marguerite de Valois. Ronsard published his *Hymns*, dedicated to Marguerite de Savoie, in 1555; the conclusion of the *Amours*, addressed to another heroine, in 1556; and then a collection of *Oeuvres complètes*, said to be due to the invitation of Mary Stuart, queen of Francis II., in 1560; with *Élégies, mascarades et bergeries* in 1565. To this same year belongs his most important and interesting *Abrégé de l'art poétique français*.

Charles IX. gave him rooms in the palace; he bestowed upon him divers abbacies and priories; and he called him and regarded him constantly as his master in poetry. Neither was Charles IX. a bad poet. This royal patronage excited violent dislike to Ronsard on the part of the Huguenots, who wrote constant pasquinades against him, strove (by a ridiculous exaggeration of the Dionysiac festival at Arcueil, in which the friends had indulged to celebrate the success of the first French tragedy, Jodelle's *Cleopâtre*) to represent him as a libertine and an atheist, and (which seems to have annoyed him more than anything else) set up his follower Du Bartas as his rival. According to some words of his own, which are quite credible considering the ways of the time, they were not contented with this variety of argument, but attempted to have him assassinated.

During this period Ronsard's work was considerable but mostly occasional, and the one work of magnitude upon which Charles put him, the *Françoise* (1572), has never been ranked, even by his most devoted admirers, as a chief title to fame. The metre (the decasyllable) which the king chose could not but contrast unfavourably with the magnificent alexandrines which Du Bartas and Agrippa d'Aubigné were shortly to produce; the general plan is feebly classical, and the very language has little or nothing of that racy mixture of scholarliness and love of natural beauty which distinguishes the best work of the Pléiade. Moreover it had the singular bad luck almost to coincide with the massacre of St. Bartholomew, which had occurred about a fortnight before its publication. The death of Charles made little difference in the court favour which Ronsard enjoyed, but, combined with his increasing infirmities, it seems to have determined him to quit court life. During his last days he lived chiefly at his house in Vendôme, the capital of his native province, at his abbey at Croix-Val in the same neighbourhood, or else at Paris, where he was usually the guest of Jean Galland, well known as a scholar, at the Collège de Boncourt. It seems also that he had a town house of his own in the Faubourg Saint-Marcel. He received gifts and endowments from foreign patrons, including Elizabeth of England. Mary, queen of Scots, who had known him earlier, addressed him from her prison; and Tasso consulted him on the *Gerusalemme*. He died at his priory of Saint-Cosme at Tours, and he was buried in the church of that name on Dec. 27, 1585.

After Ronsard's death the classical reaction set in under the auspices of Malherbe. After Malherbe the rising glory of Corneille and his contemporaries obscured the tentative and unequal work of the Pléiade, which was, moreover, directly attacked by Boileau himself, the dictator of French criticism in the last half of the 17th century. Then Ronsard was, except by a few men of taste, like La Bruyère and Fénelon, forgotten when he was

not sneered at. In this condition he remained during the whole 18th century and the first quarter of the 19th. The Romantic revival, seeing in him a victim of its special *déte noire* Boileau, and attracted by his splendid diction, rich metrical faculty, and combination of classical and mediæval peculiarities, adopted his name as a kind of battle cry, and for the moment exaggerated his merits somewhat. The critical work, however, of Sainte-Beuve in his *Tableau de la littérature française au 18ème siècle*, established his place in French literature.

Generally speaking, Ronsard is best in his amatory verse (the long series of sonnets and odes to Cassandra, Marie, Genève, Hélène—Hélène de Surgères, a later and mainly "literary" love—etc.), and in his descriptions of the country (the famous "Mignonne allons voir si la rose," the "Fontaine Bellerie," the "Forêt de Gastine," and so forth), which have an extraordinary grace and freshness. No one used with more art than he the graceful diminutives which his school set in fashion. He also knew well how to manage the gorgeous adjectives ("marbrine," "cinabrine," "ivoirine" and the like) which were another fancy of the Pléiade, and in his hands they rarely become stiff or cumbersome. In short, Ronsard shows eminently the two great attractions of French 16th-century poetry as compared with that of the two following ages—magnificence of language and imagery and graceful variety of metre.

BIBLIOGRAPHY.—Of editions of his *Oeuvres complètes* he himself published seven—the first in 1560, the last in 1584. Between his death and 1630 ten more complete editions were published, the most famous of which is the folio of 1609. From 1630 Ronsard was not again reprinted for more than two centuries. Just before the close of the second, however, Sainte-Beuve printed a selection of his poems to accompany the above-mentioned *Tableaux* (1828). There are also selections by M. Noël (in the *Collection Didot*) and Bezy de Fouquières. M. Prosper Blanchemain, who had previously published a volume of *Oeuvres inédites de Ronsard*, undertook a complete edition of 8 vol. (1857-67) for the *Bibliothèque Elzévirienne*. Later editions are by Marty-Laveaux (1887-1893), and B. Pilleau (1891); and by P. Laumonier, 2 vol. (1914). C. H. Page published a translation of his *Songs and Sonnets* with introductory essay and notes (1905). As for criticism, Sainte-Beuve followed up his early work by articles in the *Cassandre du lundi*, and the chief later critics have dealt with him in their collected works. In English A. Tilley's *Literature of the French Renaissance* (1904) and Saintsbury's *History of Criticism*, vol. II, may be consulted. See also P. Champion, *Ronsard et son temps* (1905); E. de Nolhac, *Ronsard et l'humanisme* (1921); H. Franchet, *Le Poète et son œuvre d'après Ronsard* (1923); P. Laumonier, *Ronsard* (1923); S. de Ricci, *Catalogue d'une collection unique des éditions originales de Ronsard* (1925); H. Wolfe, *Ronsard and French Romantic Poetry* (1933); and D. B. W. Lewis, *Ronsard* (1944).

RÖNTGEN, DAVID, sometimes called **DAVID DE LUNÉVILLE** (1743-1807), German cabinetmaker, eldest son of Abraham Röntgen, was born at Herrenhag on Aug. 1, 1743, and died at Wiesbaden on Feb. 12, 1807. In 1753 his father migrated to Neuwied, near Coblenz, where he established a furniture factory. He learned his trade in his father's workshop, and succeeded to the paternal business in 1772. At that time the name of the firm was already well known, but although he is always reckoned as one of the foreign cabinetmakers and workers in marquetry who, like Jean Riesener (*q.v.*), achieved distinction in France during the super-*naissance* of the Louis Seize style, he never ceased to live at Neuwied, always apparently the chief of his family. He was married in 1769 to a lady of a noble family in Prussia. His first appointment was in Aug. 1774. He soon acquired a reputation as the designer who supplied the most beautiful and valuable furniture for the palaces of the Prussian monarchs. He was particularly noted for his designs for the interior of the palace at Berlin, and for his designs for the interior of the palace at Potsdam. He was also noted for his designs for the interior of the palace at Berlin, and for his designs for the interior of the palace at Potsdam. He was also noted for his designs for the interior of the palace at Berlin, and for his designs for the interior of the palace at Potsdam.

tion of his ingenuity in surmounting a secretaire with a clock indicating the date of the Russian naval victory over the Turks at Cheshme, news of which had arrived on the previous evening. In 1793 the Revolutionary government seized the contents of his showrooms and his personal belongings. Five years later the invasion of Neuwied led to the closing of his workshops to which prosperity never returned.

RÖNTGEN, WILHELM KONRAD (1845-1923), German physicist, was born at Lennepe on March 27, 1845. He received his early education in Holland, and then went to study at Zürich. He then became assistant to August Kundt at Würzburg and afterward at Strasbourg, becoming *privatdozent* at the latter university in 1874. Next year he was appointed professor of mathematics and physics at the Agricultural academy of Hohenheim, and in 1876 he returned to Strasbourg as extraordinary professor. In 1879 he was chosen ordinary professor of physics and director of the Physical institute at Giessen, and in 1885 he went to Würzburg in the same capacity. It was at the latter place that he made the discovery for which his name is chiefly known, the Röntgen rays. In 1895, while experimenting with a highly exhausted vacuum tube on the conduction of electricity through gases, he observed the fluorescence of a barium platinocyanide screen which happened to be lying near. Further investigation showed that this radiation had the power of passing through various substances which are opaque to ordinary light, and also of affecting a photographic plate. Its behaviour being curious in several respects, particularly in regard to reflection and refraction, he doubted whether it was to be looked upon as light or not, and put forward the hypothesis that it was due to longitudinal vibrations in the ether, not to transverse ones like ordinary light; in view of the uncertainty existing as to its nature, he called it X-rays. For this discovery he received the Rumford medal of the Royal society in 1896, jointly with Philip Lenard, who had already shown, as also had Heinrich Hertz, that a portion of the cathode rays could pass through a thin film of a metal such as aluminum. Röntgen also conducted researches in various other branches of physics, including elasticity, capillarity, the ratio of the specific heats of gases, the conduction of heat in crystals, the absorption of heat rays by different gases, piezo-electricity, the electromagnetic rotation of polarized light, etc. Röntgen received the Nobel prize for physics in 1901. He died at Munich on Feb. 10, 1923.

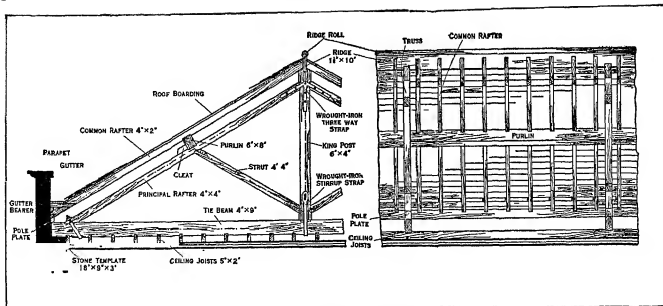

See also X-RAYS, NATURE OF.

ROOFS. A roof is the covering of a structure. Its chief purpose is to enclose the upper parts of a building as a protection against wind, rain and snow; in communities of dwellings, domestic buildings, industrial and commercial structures, fire-resistance is a necessary property of roofing.

Roofs may be flat, or may be inclined at an angle to suit the roof covering. Covering materials are selected for pitched roofs according to their resistance to rain and snow, durability in changes of temperature and in acid atmospheres, and for their artistic qualities in relation to architectural design. Modern buildings erected in concrete usually have flat roofs, consisting of concrete slabs surfaced with asphalt or with waterproofed cement coatings. Sufficient fall must be given to drain water off quickly and adequate gutters formed in the concrete to discharge the water in heavy storms.

For buildings erected in steel framework flat concrete roofs may be adopted, but in order to keep the eaves of a building at a lower level, while providing additional storeys in the accommodation, it is more usual in cities to adopt a Mansard type of roof, having the general form shown in fig. 5, but constructed in steel. Cross members are avoided as much as possible—except where required as floor girders—and the frame is made rigid by strong steel gussets at the changes of direction of the slopes. Two storeys in the roof—or more—can be obtained in this way.

While timber framework continues to be used for supporting roof coverings of lead, copper, zinc, special felts, asbestos sheets, slates and tiles—both for flat and pitched roofs—steel has largely replaced timber for the main supports and for many transverse members in the larger buildings, and even for semipermanent

FIGS. 1 & 2.—KING-POST ROOF TRUSS

industrial buildings and stores, because of the rapidity with which materials can be prepared, assembled and erected. Steel is also economically justified for use in roof framing except for dwellings and small buildings, or for dye-works and bleach-works where rapid oxidation renders steel unsuitable. Roofs are often made with considerable projection at the eaves. This serves to protect the upper portion of the external walls and also possesses aesthetic value in design.

Forms of Roofs.—The simplest form is the "flat roof" consisting of horizontal wood joists laid from wall to wall as in floors. The roof must have sufficient fall to allow water to drain away into gutters placed at convenient points. The joists are covered with boards followed by a waterproof material such as asphalt, lead, zinc or copper. These flat roofs cannot be economically constructed for cold climates with heavy snowfalls; they are difficult to maintain watertight under such conditions.

"Lean-to," "shed," or "pent" roofs are developments of the same form of construction as the flat roof, one end of the joists (now called "rafters") being lifted to form a decided slope, which enables slates, tiles, asbestos sheets and other materials to be employed in small units.

Simple roofs in general use with a double slope are called "coupled rafter roofs," the rafters meeting at the highest point upon a horizontal ridge-piece which stiffens the framework and gives a level ridge-line. In some old roofs the rafters are connected without any intervening ridge-plate, with the result that after a time the ridge instead of remaining level takes on a wavy outline, due to the fact that some of the timbers have settled slightly owing to decay or other causes, whilst others have remained firm. The lower ends of the rafters should rest upon a wood plate bedded on the top of the wall; this assists in spreading the weight over the wall, and provides fixing for the timbers. The simple "couple roof" consists merely of two sets of rafters pitched from plates on the walls on either side of the building and sloping upwards to rest against a common ridge-piece. There are no ties between the feet of the rafters, which therefore exert a considerable thrust against the supporting walls; this form of roof is only suitable for spans of 10 to 12 feet. Where the ends of the rafters are connected by ceiling joists which form a level ceiling the joists act as ties and prevent any outward thrust on the supports. Such roofs are termed "couple close roofs." When used for spans between 12 ft. and 18 ft. a binder supported by an iron or wood "king" tie every 5 or 6 ft. should be run along across the centres of the ceiling joists and the latter spiked to it. When ties are fixed about half-way up the rafters the roof is called a "collar roof," and may be used for spans up to 16 ft. This type of roof is commonly used in dwelling-houses where the

fir framing is generally hidden from view by the ceilings. Where required extra support is obtained from partitions and cross walls. If the span is above 20 ft. without intermediate support, it is necessary to employ "principals" and "purlins." American usage sanctions much greater spans than English for simple raftered roofs. Frequently spans as great as 30 ft. or more are roofed without trusses or interior supports, provided that the feet of the rafters are adequately tied by means of ceiling or floor joists at or near the plate level. Principals are strong trusses of timber rigidly framed together and placed at intervals of about 10 ft. to support the weight of the roof covering. Purlins—stout timbers running longitudinally—are supported on the principal rafters at intervals of 6 to 8 ft., and on these the common rafters are fastened. Principals, or "roof trusses" as they are more often called, are framed together in various ways; they may be of timber members with iron fastenings, or entirely of steel, or again a combination of steel and timber. In the latter case they are called "composite trusses" and the use of steel is confined to tension members.

The "king-post truss" may be used for spans up to 30 ft. and is constructed as shown in figs. 1 and 2. It has a central post sustaining the "tie-beam" in the centre with struts projecting from its base to support the principal rafters at a point where the weight from the purlins renders strutting necessary. The members are connected by wrought-iron straps and bolts; a strap connects the king-post and tie-beam and is often fitted with a gib-and-cotter arrangement (iron folding wedges) which allows the whole truss to be tightened up should any settlement or shrinkage occur. "Queen-post trusses" have two queen-posts supporting the tie beam (fig. 3). Trusses of this type are suitable for spans up to 45 ft. The joints between the members are made in a similar manner to those of the king-post principal with wrought-iron straps. There are two purlins on each slope, one supported at the top of each "queen," the other about half-way down the principal rafter. A stout straining beam connects the heads of the queens. In fig. 4, *a* and *b* are details at the foot of the queen-post, and *c* at the head. In roofs of larger span, up to 60 ft., the tie-beam requires to be upheld at more than two points, and additional posts called "princesses" are introduced for this purpose. This also entails extra struts and purlins. In such large spans the straining beam often becomes of such a length as to require support and this is effected by continuing the principal rafters up to the ridge and introducing a short king-post to sustain the beam in the middle of its length.

Open Timber Roofs.—Open timber roofs of various types but principally of "hammer-beam" construction were used in the middle ages where stone vaulting was not employed. Many of

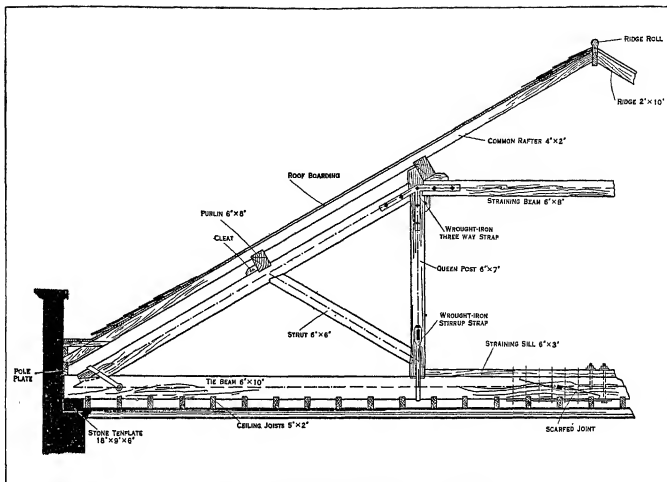

FIG. 3 — QUEEN-POST ROOF TRUSS: HALF ELEVATION, 38 FT. SPAN

these old roofs still exist in good preservation and exhibit the great skill of the mediaeval carpenters who designed and erected them. Such forms are still used, chiefly for ecclesiastical buildings and the roofs over large halls. In the best periods of Gothic architecture the pitch of these roofs was made very steep, sometimes as much as 60° with the horizon. In the hammer-beam

FIG. 4.—(A) DETAIL OF QUEEN-POST TRUSS AT B. (B) VERTICAL SECTION THROUGH QUEEN-POST. (C) DETAIL OF QUEEN-POST TRUSS AT HEAD. PURLIN AND WROUGHT-IRON STRAPS ARE OMITTED FOR THE SAKE OF CLEARNESS

type of roof the tie-beam at the foot of the rafters is omitted, a collar connecting the principal rafters at a point about half-way in their length, and the lower portion of the rafters consisting of struts and braces rigidly connected to relieve thrust upon the walls serving as abutments. There are two kinds of hammer-beam, the arched and the bracketed. The "hammer-beam" projects from the top of the wall and is bracketed from a corbel projecting from the wall some distance below. This form

of roof has a style and dignity appropriate to the period in which it was developed.

The Mansard Roof (fig. 5) is a useful form of construction which obtains its name from François Mansart (*q.v.*). This kind of roof has been largely used in France and other European countries, and in America in the old colonial days. It is well adapted to some styles of architecture, but requires careful proportioning of the slopes for a satisfactory effect. In America the term "Mansard Roof" (*q.v.*) is reserved for roofs of double pitch sloping up from all 4 sides of building; the term "gambrel roof" (*q.v.*) being applied to double pitched roofs ending in gables. By the use of a Mansard roof extra rooms can be obtained without adding an additional storey to the building. Fig. 5, A, B, C, D and E show various sectional forms. A similar type of curb roof is often used having a flat lead or zinc-covered top in place of the pitched slate or tile-covered top of the ordinary Mansard roof.

Composite Roof Trusses of wood and iron are frequently used for all classes of buildings, and have proved very satisfactory. They are built upon the same principles as wooden roof trusses. The struts—that is, those members subjected to compressional stress—are of wood, and iron bars or rods are used for the ties, which have to withstand tensile forces. When shrinkage occurs, as usually happens in large trusses, the joints of the framing are tightened up by the bolts attached to the tie-rods. Figs. 6, 7 and 8 are the sections and plan of a simple method of constructing the roof for a small domestic building with plaster ceilings to the top rooms. It is a couple close roof with the addition of a collar and struts, and king-rod to every fourth rafter. Trimming is necessary for openings and where portions of the structure, such as chimney stacks, cut into the roof. A dragon tie is framed to the wall-plates at the hip angles to receive the thrust from the hip rafters.

Steel Roof Trusses.—Because of their adaptability in form

and detail, speed of fabrication and general economy, roof principals of steel are now the most usual kind of roof support where trussed framing is required. They are particularly suitable for commercial buildings, and, while not artistic if judged by comparison with the traditional treatment of timber, are capable of

FIG. 3—MANSARD ROOF TRUSS: DETAIL OF OUTLINE AS A; OTHER OUTLINES AT B, C, D AND E

acceptable aesthetic form based on the economic suitability for their particular purpose.

In the early days of steel trusses, T sections for rafters and struts were usually employed, with rounds and flats for the tie bars. Modern methods of fabrication have gradually developed the use of the L (angle) section for nearly all structural members in roof trusses of moderate span, double angles being used for rafters and ties, single gusset plates riveted between the angles, and ties and struts of either single or double angle section riveted to the faces of the gussets.

The guiding principle is simplicity of form and of detail, and efficiency for service. Often more material is employed in a member than is strictly necessary—and a more economical use of material might be arranged—but usually economy of material means a loss in fabrication costs or the necessity of carrying stocks of many and variable sections of steel.

Double channels are very convenient and largely used for compression members in large span roofs and in unusual structures.

The types of trusses in modern use are given in fig. 9. These include the "queen rod," having vertical ties and inclined struts, the "trussed rafter," in which the struts are at 90° to the rafter, and variations of these forms. Perfect triangulation of steel frames is easy to arrange and the dimensions of the members can be suitably arranged by selection from a large number of standard sections of rolled steel.

Where large areas of uninterrupted floor space are required in textile sheds, garages, etc., a form of roof is often adopted in which main girders of the parallel type, up to 150 ft. span, sup-

port cantilever trusses, the main girders being placed to form the ridges of the slopes and the cantilevers attached at each side as shown in fig. 10. The gutters are central between the trusses and the girder spacing up to 30 ft. span. Clear bays are thus provided 150 ft. \times 30 ft.

Domical Roofs.—Domes may be framed up with wood rafters cut to shape. For small spans this construction is satisfactory, but domes of considerable size are now framed in steel or in reinforced concrete. The outer dome of St. Paul's cathedral in London is of lead-covered wood, framed up and supported by a conical structure of brickwork which is raised above the inner dome of brick. Concrete is a very suitable material for use in the construction of domes, with iron or steel reinforcement in the shape of bars, mesh, or perforated plates. One of the best modern examples of concrete vaulting and domical roofing without metal reinforcement occurs in the Roman Catholic cathedral at Westminster, a remarkable building designed by Mr. J. F. Bentley. The circle developed by the pendentives of a nave dome is 60 ft. in diameter. The thickness of the dome at the springing is 3 ft. gradually reduced to 13 in. at the crown; the curve of equilibrium is therefore well within the material. The domes were turned on closely boarded centering in a series of superimposed rings of concrete, averaging 4 ft. in width, and the concrete was not reinforced. The independent external covering of the domes is formed of 3 in. artificial stone slabs cast to the curve. They rest on radiating ribs 5 in. deep of similar material fixed on the concrete and rebated to receive the slabs; thus an air space of 2 in. is left between the inner shell and the outer covering, the object being to render the temperature of the interior more uniform. At the springing and at the crown the spaces between the ribs are left open for ventilation. The sanctuary dome differs in several respects from those of the nave. Unlike the latter, which seem to rest on the flat roofing of the church, the dome of the sanctuary emerges gradually out of the substructure, the supporting walls on the north and south being

FIGS. 6 & 7.—ROOF FOR DOMESTIC BUILDING

kept down so as to give greater elegance to the eastern turrets. The apsidal termination of the choir in the east is covered in with a concrete vault surmounted by a timber roof, in striking contrast to the domes covering the other portions of the structure. Fig. 11 is a section through the nave showing how the domes are buttressed, fig. 12 is a section through the sanctuary dome, and figs. 13 and 14 a section and part plan of the vaulting of the choir with its wood span roof above the concrete vault.

Covering Materials for Roofs.—There are many different roof-covering materials in common use, of which the principal

FIG. 8.—PLAN OF A ROOF SHOWING THE DETAILS OF CONSTRUCTION

characteristics are given. The nature of the outer covering affects the details of roof construction in many respects. A light covering such as felt or corrugated iron can be safely laid upon a much lighter timber framing than is necessary for a heavy covering of tiles or slates.

Roofing felt is an inexpensive fabric of animal or vegetable fibre treated with bituminous preparations to make it capable of resisting the weather. It is used as a roofing material for temporary buildings. When exposed to the weather it should be treated with a compound of tar and slaked lime well boiled and applied hot, the surface being sprinkled with sand before it becomes hard. Bituminous felt is employed as a non-conducting and safeguarding under-cover to slates and tiles, used only for the roofs of important buildings. The felt is supplied in rolls containing from 25 to 35 yd. by 30 in. wide. The sheets should be laid with a lap of at least 2 in. at the joints and secured to the boarding beneath by large-headed clout-nails driven in about 2 in. apart.

Corrugated iron is supplied either black or galvanized. It is especially suited for the roofs of out-buildings and buildings of a temporary or semi-permanent character. Being to a large extent self-supporting, it requires a specially designed roof framework of light construction. If, as is usually the case, the sheets are laid with the corrugations running with the slope of the roof, they can be fixed directly on purlins spaced 5 ft. to 10 ft. apart according to the stiffness and length of the sheets. In pure air zinc coating of the galvanized sheets is durable for many years, but in large cities and manufacturing towns its life is short unless protected by painting. In such districts it has often been found that plain ungalvanized sheets well coated with paint will last longer than those galvanized, for the latter are attacked by corrosive influences through minute flaws in the zinc coating developed in the process of corrugation or transit or resulting from

some defect in the coating. The stock sizes of corrugated sheets vary from 5 ft. to 10 ft. long, and from 2 ft. to 2 ft. 9 in. wide with corrugations measuring 3 in. to 5 in. from centre to centre. For roofing purposes the sheets are supplied in several thicknesses ranging from No. 16 to No. 22 Standard Wire Gauge. No. 16 is for exceptionally strong work, No. 18 and No. 20 are used for good-class work, and No. 22 for the roofs of temporary buildings. The sheets when laid should lap one full corrugation at their sides and from 3 in. to 6 in. at the ends. Riveting is the best method of connecting the sheets, although galvanized bolts, which are not so satisfactory, are frequently employed. The joints should be made along the crowns of the corrugations to avoid leakage. Holes can be punched during the erection of the roof. For attachment to timber framework, galvanized screws or nails with domed washers are used. Fixing to a steel framework is effected by galvanized hook bolts which clip the purlins and pass through the sheet. Sheets corrugated in the Italian pattern have raised half-rounds every 15 in. or so, the portions between being flat. Such sheets have a very neat appearance and give a better effect in some positions than the ordinary corrugations.

Zinc in sheets is a material largely used as a roof covering, and if care be taken to ensure metal of good quality, it is strong and durable, as well as light and inexpensive. Zinc is stronger weight for weight than lead, slate, tile or glass, but weaker than copper, wrought-iron or steel, although with the exception of the latter two it is not so durable under normal roofing conditions. It is not liable to easy breakage as are slates, tiles and glass. It is usually supplied in flat sheets, although it can also be had in the corrugated form similar to corrugated sheet-iron. When exposed to air, a thin coating of oxide is formed on the surface which protects the metal beneath from any further change, and obviates the necessity of painting. In laying the sheets, the use of solder and nails should be avoided entirely except for fixing clips and

tacks which do not interfere with the free expansion and contraction of the sheets. Zinc expands freely, and sheets laid with soldered seams or fixed with nails are liable to buckle and break away owing to movements caused by changes of temperature. The usual sizes of zinc sheets are 7 ft. or 8 ft. long by 3 ft. wide and weighing from 1½ to 25 oz. per sq. ft. The thickness varies from 25 to 19 Standard Wire Gauge. A dependable method of

of impure air. Lead must be laid on a close boarding, for its great ductility prevents it from spanning even the smallest spaces without bending and giving way. This characteristic of the metal, however, conduces largely to its usefulness, and enables it to be dressed and bossed into awkward corners without the necessity of jointing. The coefficient of expansion for lead is nearly as great as that for zinc and much higher than for iron; precautions to allow free expansion and contraction must be taken when laying the lead covering. The manner of laying is with rolls and drips as in the case of zinc, the details of the work differing somewhat to suit the character of the material (see figs. 17, 18 and 19); the use of nails and solder should be avoided as far as possible. Contact with iron sets up corrosion in lead, and when nails are necessary they should be of copper; screws should be of brass. Lead is supplied in rolls of 25 to 35 ft. long and 6 ft. to 7 ft. 6 in. wide. That in general use varies from one-fourteenth to one-seventh of an inch in thickness. The weights most suitable for employment in roofing work are 7 or 8 lb. per square foot for flats and gutters, 6 lb. for ridges and hips, and 5 lb. for flashings.

As a roof covering copper is lighter, stronger and more durable than either zinc or lead. It expands and contracts much less than these metals, and although not so strong as wrought-iron and steel it is much more durable. From a structural point of view these qualities enable it to be classed as the best available metal for roof covering, although its heat-conducting properties require it to be well insulated by layers of felt and other non-conducting material placed beneath the metal. On exposure to the air copper develops a feature of great beauty in the coating of green carbonate which forms upon its surface and protects it from further decomposition. Perhaps the chief disadvantage in the use of copper has been in its first cost, but it is now comparatively cheap and account must also be taken of the almost imperishable nature of the metal and that its light weight requires less substantial framework for its support. Copper roofing should be laid in a similar manner to zinc, with wood rolls at intervals of about 2 ft. 4 in. It is, however, often laid with weltd seams. The general stock sizes of sheets are from 4 ft. to 5 ft. 3 in. long and 2 ft. to 3 ft. 6 in. wide. The thickness almost invariably used is known as 24 S.W.G. and weighs 16 oz. per square foot. Thinner metal would suffice, but owing to the increased cost of rolling very little would be gained by adopting the thinner gauges.

In the United States of America "tin" roofs are quite commonly used. Sheets of wrought-iron coated either with tin or zinc are used of a size usually 14 in. by 20 in., though they may be had double this size. Preparation for laying is made by fixing an insulating foundation of somewhat stout paper or felt; this must be dry, else it is apt to spoil the impermeable covering laid upon it by causing it to rust. Junctions between the sheets are made by weltd seams in which the four edges of the sheets are turned over so as to lock together, thus forming one large sheet of tin covering the roof. In high-class work of a permanent nature the seams in addition are soldered, rosin only being used as a flux. Each sheet also is secured to the roof with two or three tin cleats. The life of such a roof may be practically doubled by the application of a coat of good paint, which, however, adds considerably to the cost.

The greatest use of bituminous materials in modern roof coverings is in the form of tar and gravel or tar and slag roofs. These consist of three or more layers or piles glued to each other and covered by heavy coats of coal tar pitch. Onto the upper layer

FIGS. 9 & 10.—TYPES OF MODERN ROOF TRUSSES, AND A TYPE USED FOR LARGE UNINTERRUPTED FLOOR AREAS

laying zinc on flat roofs is with the aid of wood "rolls," about 2 in. \times 2 in. in section, splayed at the sides, spaced 2 ft. 8 in. apart and fixed to the roof boarding with zinc nails. Iron nails should not be used as this metal affects the zinc. The sheets of zinc are laid between the rolls with their sides bent up ¼ in. or 2 in. against them, and held firmly in position by clips of zinc attached to the rolls. A cap of the same metal is then slipped over each roll and fastened down by tacks about 3 in. long soldered inside it so as to hook under the same clips that anchor the sheet. Drips of about 2½ in. are made in the slope at intervals of 6 ft. or 7 ft.—that is, the length of a sheet—and care must be taken at these points to keep the work waterproof. The lower sheet is bent up the face of the drip and under the projecting portion of the upper sheet, which is finished with a roll edge to turn off the water. The end of the roll has a specially folded cap which also finishes with a curved or beaded water check, and this in conjunction with the saddle piece of the roll beneath forms a weather-proof joint (figs. 15 and 16). The fall between the drips is usually about ¼ in. deep, but where necessary it may be less, the least permissible fall being about 1 in. 80. Felt laid beneath zinc has the effect of lengthening the life of the roof and should always be used, as the edges of the boarding upon which it is laid are, when the latter warps, apt to cut the sheets. It also forms a cushion protecting the zinc if there is traffic across the roof.

Sheet-lead forms a much heavier roof covering than zinc, but it lasts a great deal longer and more easily withstands the attacks

FIG. 11.—WESTMINSTER CATHEDRAL SECTION THROUGH NAVE

of pitch, before it has hardened, there is sprinkled a bed of gravel or slag, which is held in place by the pitch, and at the same time protects it. Flat tile roofs, terraces or promenades are frequently built in a somewhat similar manner, with an under layer of several plies of pitch and felt, covered with an inch thick bed of cement, on which the tile is laid. Adequate expansion joints, filled with some elastic cement, are usually installed in the tiled surface. Such roofs, either tile covered or gravel and slag covered, are perfectly watertight, do not crack under extremes of heat and cold, and have become the most common type for the better class of flat roof, such as those of large modern office and apartment buildings, etc. If adequately flashed at the intersections with walls and parapets, they can be built perfectly level without fall or slope.

Slate (*q.v.*) is a strong and very impermeable material, and these qualities and the fact that it is easily split into thin plates suitable for laying, as well as its low cost, for many years caused it to be by far the most generally used of all materials for roof covering.

Slates are cut to many different sizes varying in length from 10 in. to 36 in. and in width from 5 in. to 24 in. There are perhaps thirty or more recognized sizes, each distinguished by a different name. In common practice those generally used are "large ladies," 16 in. by 8 in.; "countesses," 20 in. by 10 in.; and "duchesses," 24 in. by 12 in. Generally speaking, the rule governing the use of the different sizes is that the steeper the pitch the smaller the slate, and vice versa. Buildings in very exposed positions naturally require steeply pitched roofs, if they are to be covered and rendered weather-tight by small lapped units of covering.

Slates may be fixed by nailing at the head or at about the middle. The latter method is the stronger, as the levering effect of the wind cannot attain so great a strength. There is a small economy effected by centre nailing, as the margin is slightly larger and fewer slates are required to cover a given space; longer nails, however, are required, for as slates are laid at an angle with the pitch of the roof their centres cannot be made to approach so

slates above, and rain is very liable to be forced under by the wind and cause the wood battens or other woodwork to rot. Head-nailed slates, on the other hand, have their holes covered by two layers of slate, and are removed from exposure by the length of the gauge plus the lap, which in the case of "countess" slating equals 11 in.

A point in favour of centre-nailing is that the slates are more securely held to the battens or boards and offer much more resistance to being lifted by the wind.

"Open slating" is an economical method of laying slates that is often adopted for the roofs of sheds, foundries and temporary buildings. The slates in the same course are not laid edge to edge as in close slating, but at a distance of two or more inches apart. This forms a roof covering light in weight and inexpensive, which, although not strictly weather-proof, is sufficiently so for the buildings upon which it is used.

Slates are laid upon open battens fixed upon the rafters or upon close boarding or upon battens fixed upon boarding. The battens are $\frac{3}{4}$ in. or 1 in. thick and $1\frac{1}{2}$ in. to 3 in. wide, and are spaced to suit the gauge of the slates. When close boarding is used it is

FIG. 12.—WESTMINSTER CATHEDRAL: DIAGONAL SECTION THROUGH SANCTUARY DOME

for the better class of flat roof, such as those of large modern office and apartment buildings, etc. If adequately flashed at the intersections with walls and parapets, they can be built perfectly level without fall or slope.

Slate (*q.v.*) is a strong and very impermeable material, and these qualities and the fact that it is easily split into thin plates

FIGS. 13 & 14.—WESTMINSTER CATHEDRAL: CHOIR-VOLTING

FIGS. 17, 18 & 19.—DETAILS OF LEAD FLATS

often covered with inodorous asphalted felt, and to allow of ventilation of the materials, under-battens are sometimes fixed vertically, ridge ventilators introduced and air inlets arranged at the eaves. The beds of slates laid without provision for the admission of air have been found occasionally to have rotted so as to scale and crumble easily.

The nails used in slating are important and the durability of the work depends on a good selection. They should have large flat heads. The most satisfactory are those made of a composition of copper and zinc, but others of copper, zinc, galvanized iron and plain iron are used. Those of copper are most durable, but are soft and expensive while zinc nails are soft and not very durable; they will last for about twenty years. Iron nails even if galvanized are only employed in cheap and temporary work; they may be preserved by being heated and plunged in boiled linseed oil. The pitch of a roof intended for slating should not incline less than 25° with the horizontal, while for the smaller sizes 30° is a safer angle to adopt.

Modern slate roofs are frequently laid with varying courses and of varying thicknesses, usually with the heavier slate from three-quarters to an inch and a half thick at the eaves, with thinner and smaller slate in the upper part of the roof. Marked variation of colour is often sought by combining green and purple slate, or fading and unfading slate.

Tiles for roofing purposes are made from clay and baked in a kiln, like bricks. The clay from which they are made is, however, of a specially tenacious nature and prepared with great care so as to obtain a strong and non-porous covering. Tiles are obtainable in many colours, some having a beautiful effect when fixed and many improving with age. They comprise tints from yellowish red, red and brown to dark blue. As with bricks the quality depends to a large extent upon the burning; underburnt tiles are weak and porous, liable to early decay, while overburning, though improving the tiles as regards durability, will cause warping and variation of colour. Variation of colour is now deliberately obtained, and artistic effects are secured by sand facing, artificial rustication and by burning to metallic surfaces. The usual shape is the "plain tile," but they are made in various other shapes with a view both to easier fixing and lighter weight, and

FIGS. 15 & 16.—DETAILS OF ZINC FLATS

near to the slating battens or boarding as the head, which lies close to the surface to which it is fixed. Another important point is that the nail-holes in the centre-nailed slating are only covered by 3 in. of the tail (the amount of the "lap") of the course of

to ornamental effect. There are also several patented forms on the market for which the makers claim special advantages. The ordinary tiles are slightly curved in the direction of length to enable them to lie closely at their lower edges. Some of them have small "nibs" at the head by which they may be hung upon the battens without nails. Nail-holes are provided, and it is advisable to nail every 4th or 5th course, at least. Others are made without the nibs, and are fixed either by nailing to the battens or hoarding or hung by means of oaken pegs wedged in the holes to the battens, the pegs in the latter case acting in the same way as the above-mentioned nibs. Plain tiles are of rectangular form, the standard dimensions are 14 in. long by 6½ in. wide. They are usually ½ in. thick and weigh about 2½ lb. each.

There are many forms of ornamental tiles, which are plain tiles having their tails cut to various shapes instead of moulded square. A number of patented forms of tiles also are on the market, some of which possess considerable merit. *Pantiles* are suitable for temporary and inferior buildings, if laid dry and on flat slopes, but if laid upon boards and felt and bedded and pointed in mortar, pantiles may prove an excellent covering. They are laid on a different principle from plain tiles, merely overlapping each other at the edges, and this necessitates bedding in mortar and pointing inside and sometimes outside with mortar or cement. This pointing plays an important part in keeping the interior of the building free from the penetration of wind and water. Pantiles are generally made to measure 13½ in. long by 9½ in. wide, and weigh from 5 lb. to 5½ lb. each. Moulded on at the head of each tile is a small projecting nib which serves for the purpose of hanging the tile to the lath or batten. They are laid with a lap of 3½ in., 2½ in. or 1½ in., giving a gauge (and margin) of 10 in., 11 in. and 12 in., respectively. The side lap is generally 1½ in., leaving a width of 8 in. exposed face. There are many other forms based upon the shape of the pantile, some of which are patented and claim to have advantages which the original form does not possess. Among such are "corrugated tiles," of the ordinary shape or with angular flutes, and also the Italian pattern "double roll tiles." Foster's lock-wing tiles." Poole's bonding roll tiles are a development of the Italian pattern tile. French and Belgian tiles of the "Marseille" pattern are economical and therefore popular for housing schemes and cheap building.

Wood shingles are common roofing materials throughout the United States and Canada, and were at one time in general use in Europe. The present customary usage is to make them either of cedar or cypress, varying from 18 to 24 inches long, and from 6 inches to a foot or more wide. The butts at the thick end are from a half to three-quarters of an inch thick; the upper end tapers to not over one-eighth of an inch. They are usually laid from four and one-half to five and one-half inches to the weather. Owing to the fire risk, wood shingle roofs are gradually passing out of use, and in many localities are prohibited.

The 20th century has seen the development of many specialized roof materials, either with an asbestos or a bituminous felt base, designed for sloping roofs and intended to give an aesthetic effect similar to that of either shingles or slate. In the better and heavier types the units come separately as individual shingles; in the lighter and cheaper classes, the shingle shapes are cut upon strips.

Glass as a roof covering and the different methods of fixing it are dealt with in the article GLAZING.

There are many other materials used for roof covering besides those already described, many of them of considerable value. Some have in the past enjoyed considerable vogue, but have practically died out of use owing to the development and cheapening of other forms of roofing. Among these may be included thatch and wood shingles, the use of which in these days is practically reduced to special cases. Other roofing materials are those of recent invention, some of which may have a great future, depending upon the development, reliability and aesthetic value of the products. Sheets of asbestos-cement used as slates or tiles make a light, strong and fireproof covering. Large terra-cotta tiles or slabs are much used in the United States of America. A

good form of flat roof is that in which concrete is used as a foundation for a waterproof layer of asphalt, laid to fall to allow the water to run off easily. This is the usual method adopted when a roof garden is required. Shingles or thatch look extremely well on a roof, but their use is debarred in a great many districts owing to the danger of fire. Galvanized iron tiles, zinc tiles and copper tiles may be employed on small areas with good effect. The London County Council (General Powers) Act, 1909, requires provision for a normal wind pressure of 28 lb. per sq. ft. if the inclination is 20° or more. Flat roofs must be designed to carry 56 lb. per sq. ft. in addition to their own weight. From the above particulars it is easy to calculate the weight of the roofing-material and the wind pressure on the roof.

Regulations.—The London Building Act of 1894 and its amendments set forth with regard to roofs erected in the London district that every structure on a roof is to be covered with slate, tile, metal or other incombustible material, except wooden cornices and barge boards to dormers not exceeding 12 in. in depth, and doors and windows and their frames. Every dwelling-house or factory above 30 ft. in height and having a parapet must have means of access to the roof. The pitch of the roofs of warehouse buildings must not exceed 47°, and those of other buildings 75°, but towers, turrets and spires are excepted. In domestic buildings not more than two storeys are to be formed in the roof, and if the floor is more than 60 ft. above the street level fireproof materials must be used throughout and a sufficient means of escape provided.

The Building and Health Laws and Regulations and Amendments affecting the city of New York are similar to those of London. They give very full working details as to the strengths of materials required to be used and the wind pressure to be provided against. They provide that where a building exceeds three storeys or 40 ft. in height and the roof has a pitch of over 60°, it shall be constructed of iron rafters and be lathed with iron or steel inside and plastered or filled in with fireproof material not less than 3 in. thick and covered with metal, slate or tile.

LITERATURE.—The principal reference books on this subject are the following:—G. L. Suttcliffe, *The Modern Carpenter, Joiner and Cabinet Maker*; J. Gwilt, *Encyclopedia of Architecture*; F. E. Kidder, *Trussed Roofs and Roof Trusses*; J. Brandon, *Analysis of Gothic Architecture*; A. Pugin, *Ornamental Gables*; M. Emy, *L'Art de la charpenterie*; Viollet le Duc, *Dictionnaire*; J. K. Collins, *Details of Gothic Architecture*; G. Ellis, *Modern Practical Carpentry*; Jaggard & Drury, *Architectural Building Construction*; Blake, *Roofs & Roof Coverings*; J. W. Riley, *Carpentry & Joinery*; C. F. Mitchell, *Building Construction*; Rivington, *Building Construction*.

ROOK (*Corvus frugilegus*), throughout a great part of Europe, the commonest of the crow tribe. Besides its gregarious habits, which are distinctive, the rook is distinguished from the rest of the *Corvidae* by losing at an early age the feathers from its face, leaving a bare, scabrous and greyish-white skin visible at some distance. In the rare cases in which these feathers persist, the rook may be known from the crow (*c.v.*) by the rich purple gloss of its black plumage, especially on the head and neck, as well as by its voice. The sexes are very similar. It nests in colonies on large trees (occasionally on buildings), making a strong nest of twigs and earth and using it year after year. The three to five green eggs, marked with grey and brown, are laid in early April. In Britain the rook is resident and stationary, but in most of Europe it is either a summer or winter visitor. Its food is very varied, but includes a high percentage of noxious insects. The bird is thus of great value to the farmer.

ROON, ALBRECHT THEODOR EMIL, COUNT VON (1803–1879), Prussian general field-marshal, was born at Pleushagen, near Colberg, in Pomerania, on April 30, 1803. He entered the corps of cadets at Kulm in 1816, proceeded to the military school at Berlin, and in Jan. 1821 joined the 14th (3rd Pomeranian) regiment. In 1826 he was appointed an instructor in the Berlin cadet school, and in 1832 published his *Grundzüge der Erd-, Völker- und Staaten-Kunde* (3 vols.), gaining a great reputation. This was followed by *Anfangsgründe der Erdkunde* (1834), *Militärische Länderbeschreibung von Europa* (1837) and *Die iberische Halbinsel* (1839).

In 1832, he rejoined his regiment, and became alive to the inefficient state of the army; in 1842 he was promoted to be major and attached to the staff of the VII. Corps. In 1848 he was appointed chief of the staff of the VIII. Army Corps, and during the disturbances of that year served under the Crown Prince William (afterwards emperor), distinguishing himself in the suppression of the insurrection at Baden. At that time he broached the subject of his schemes of army reform. In 1850 came the revelation of defective organization; next year Roon was made a full colonel and began active work as reorganizer.

Prince William became regent in 1857, and in 1859 he appointed Roon (now lieutenant-general) a member of a commission to report on military reorganization. Supported by Manteuffel and Moltke, Roon was able to get his plans to create an armed nation, to extend Schamhorst's system and to adapt it to Prussia's altered circumstances generally adopted. To attain this he proposed a universal three years' service, and a reserve (*Landwehr*) for the defense of the country when the army was actively engaged. During the Italian War he was charged with the mobilization of a division. At the end of 1859, though the junior lieutenant-general in the army, he succeeded von Bonin as war minister, and two years later the ministry of marine was also entrusted to him. His proposals of army reorganization met with the bitterest opposition, and it was not until after long fighting against a hostile majority in the chambers that, with Bismarck's aid, he carried the day. Even the Danish campaign of 1864 did not wholly convince the country of the necessity of his measures, and it required the war with Austria of 1866 (when he was promoted general of infantry) to convert obstinate opposition into enthusiastic support. After that von Roon became the most popular man in Prussia, and his reforms were ultimately copied throughout continental Europe. His system, adopted after 1866 by the whole North German Confederation, produced its inevitable result in the war with France 1870-71. He was created a count, and in Dec. 1871, succeeded Bismarck as president of the Prussian ministry. Ill-health compelled him to resign in the following year. He was promoted field-marshal on Jan. 1, 1873, and died at Berlin on Feb. 23, 1879.

After his death his son published the valuable *Denkwürdigkeiten aus dem Leben des Generalfeldmarschalls Kriegsministers Grafen Roon* (3 vols., Breslau, 1892), and *Kriegsminister von Roon als Redner politisch und militärisch erläutert* (Breslau, 1895). His correspondence with his friend Professor C. Pethes, 1854-67, was also published at Breslau in 1895.

ROORKEE, a town of British India, in the Saharanpur district of the United Provinces. Pop. (1941) 23,329, including the cantonment. It is the headquarters of the workshops of the Ganges canal, and also of the Bengal Sappers and Miners. The Thomason Civil Engineering college, founded in 1848, was instituted in order to train Indians in engineering, and students originally received stipends. The college works in co-operation with the workshops and foundry of the canal, and also trains in surveying, photography and other subjects, having chemical, physical, electrical and mechanical laboratories and workshops.

ROOSEVELT, FRANKLIN DELANO (1882-1945), thirty-second President of the United States, was born at Hyde Park, N. Y., Jan. 30, 1882. His father, James Roosevelt a wealthy landowner, vice-president of the Delaware & Hudson Railroad, and Democratic politician, held several minor diplomatic offices under President Cleveland; his mother, Sara Delano, had sprung from a family of New York merchants and shippers. The upper Hudson Valley community in which Franklin D. Roosevelt was reared was devoted to sports, and he early learned to hunt to hounds, shoot, play polo and tennis, and manage an ice-boat. In summers at Campobello on the New Brunswick coast he made long cruises by catboat and yacht. European travel began when the boy was three and he learned to speak German and French fluently. Passing through Groton School, he entered Harvard in 1900 and on graduation went to the Columbia University Law School in 1904. In March, 1905, he married Anna Eleanor Roosevelt of New York, a sixth cousin, the wedding being attended by President Theodore Roosevelt, who was uncle of the bride and fifth cousin of the groom. Thereafter the couple frequently saw President Roosevelt in Washington or at Oyster Bay. In 1907 Franklin D. Roosevelt completed his course at Columbia, was admitted to the bar, and began practice in New York City. His father had meanwhile died, and he combined his legal work with frequent visits to Hyde Park where he took an important position in business, philanthropic and social activities.

Contact with Theodore Roosevelt inspired the young man with

an interest in politics; the Democratic leaders in Dutchess County saw in him a promising recruit. In 1910 they gave him the nomination for State Senator. Though only one Democrat had been elected to that post since 1836, by virtue of a pleasing personality, a strenuous automobile campaign, and a schism in the Republican party, he obtained a narrow majority. In his first year in Albany he attained prominence by leading a small band of Democratic legislators who refused to accept the Tammany Hall candidate for election to the U. S. Senate, William F. Sheehan. Declaring Sheehan unfit for the place by his character and close association with predatory traction corporations, Roosevelt held his fellow-insurgents firm against the party caucus till a better candidate was substituted. The reputation for progressivism and independence which he thus obtained was extended by his championship of reform legislation. In 1911 he was prominent in the New York movement for nominating Woodrow Wilson to the Presidency, and in June, 1912, led an unofficial delegation of 150 men to the Democratic Convention in Baltimore, where he did effective work. Re-elected that fall to the State Senate, he introduced some notable bills for protecting the farmers against unfair commission merchants and stimulating rural co-operation. The incoming Wilson Administration offered him a choice of several minor posts; he accepted the Assistant Secretaryship of the Navy.

Spending the years 1913-1921 in the Navy Department, Mr. Roosevelt was the principal lieutenant of Secretary Josephus Daniels in administering naval affairs. During 1913-1916 he was an unwearied advocate of greater naval preparedness, producing many speeches and articles; he set about converting useless navy yards into industrial plants for making naval supplies; and he and Mr. Daniels broke up an alleged combination of armour plate manufacturers. Before war broke out he had built up a small Naval Reserve on the basis of systematic civilian training. During the conflict he gave much attention to the submarine problem. He was one of the earliest and most enthusiastic advocates of the mine barrage between Norway and the Orkneys, refusing to heed American and British experts who pronounced it impossible; and he was also largely responsible for the 110-foot submarine chasers, of which about 400 were built. In the summer of 1918 he had charge of the inspection of American naval forces in European waters and did much to promote co-operation with the British Admiralty. After the armistice he took charge of demobilization in Europe and helped dispose of naval supplies stored there. He returned to the United States on the same ship with Wilson (February, 1919) and began speaking for the League of Nations. The following year he received the Democratic nomination for Vice President, made approximately a thousand speeches, and after the Democratic defeat returned to New York to practise law.

In August, 1921, Mr. Roosevelt was stricken with infantile paralysis and emerged with the muscles of his legs and lower abdomen paralyzed. By careful exercises and winter treatments at Warm Springs, Ga., he gradually recovered. Meanwhile he continued legal work, establishing the firm of Roosevelt & O'Connor in 1924, and kept up much of his business and civic activity. As head of the Boy Scouts Foundation in New York City he raised large sums, and at Warm Springs he established an important hydrotherapeutic centre on a non-profit-making basis. In 1924 he placed Alfred E. Smith in nomination at the Democratic National Convention. After the Democratic defeat of that year he made efforts to bring the Bryan-McAdoo and Smith-Raskob factions together on a progressive basis. These failed; but he succeeded in softening much of the Southern opposition to Smith. In 1927 he urged acceptance of Smith and in 1928 nominated him again at the Houston Convention. At Smith's insistence, though protesting that two more years of private life were necessary to his health, he allowed himself to be drafted as Democratic candidate for governor of New York. Carrying the State by about 25,000 votes while Smith lost it by more than 100,000, he was inaugurated in January, 1929. He furnished a conciliatory administration, and in 1930 was re-elected by the unprecedented plurality of 725,000, economic depression and the quarrel over prohibition cutting down the Republican vote. His

principal achievements in his two terms as governor were partial settlement of the hydroelectric question on the basis of public development of the St. Lawrence waterpower; a strengthening of the Public Service Commission; and passage of various pieces of social welfare legislation, including an old-age pension law.

With the approach of the election of 1932, it became evident that Mr. Roosevelt was in a happy position to unite the discordant Democratic elements. At the Chicago Convention in July the rival candidates proved unable to unite, and on the third ballot a change by the California and Texas delegations gave Mr. Roosevelt the nomination. He at once began a campaign which took him into every section, travelling 12,500 miles and delivering some 200 speeches. Making effective use of demands for tariff reduction, farm relief, and greater attention to the "forgotten man," he enlisted the support of many influential Progressive Republicans. The economic depression caused an enormous defection of Republican voters, and in November Roosevelt received 472 electoral votes against 59 for Hoover, carrying all but six states with a popular plurality of over seven million.

Mr. Roosevelt took office, March 4, 1933, amid the throes of a crisis unprecedented in time of peace. Between his election and inauguration he had realized its imminence and had prepared the broad outlines of a programme. Details of his plans, in a fast-changing situation, had to be worked out in the heat of the moment. His first task, as the nation seemingly stood on the brink of an abyss, was to restore its morale. An eloquent inaugural address caught the popular imagination. It was at once followed by a proclamation closing banks, embargoing gold, and proving the government's power to cope with the financial crisis. From that point he moved swiftly toward three objectives already outlined: restoration of prosperity "by re-establishing the purchasing power of half the people"; a better balance between farm, factory, and trade; and reshaping the American economic system to eliminate abuses and excesses.

The 99-day session of the 73rd Congress which began March 9, 1933, witnessed the most daring Presidential leadership in American history. Congress, dazed and planless, found itself subjected to a carefully timed bombardment of bills. Mr. Roosevelt sent a rapid succession of presidential messages, sufficiently spaced to avoid confusion; followed each message by a bill to implement it; and thus dealt with the agricultural crisis, banking crisis, relief crisis, and a dozen other problems with amazing speed. The fact that Congress was passing laws to order was never concealed; never before had the American Government so closely approached the British system of Ministerial leadership. In his first month Mr. Roosevelt used this unprecedented authority (1) to reopen banks; (2) to restore Federal credit by temporarily abolishing some of the worst forms of waste; (3) to relieve distress by Federal grants, creation of the Civilian Conservation Corps, and stoppage of foreclosures; (4) to reform the handling of investments and securities; and (5) to begin a system of public works. These emergency measures were at once followed by four steps of the most far-reaching character: (1) a farm relief law; (2) creation of the Tennessee Valley Authority to plan the development of a 640,000-sq. mi. region; (3) passage of the National Recovery Act; and (4) the decision to abandon the gold standard and move toward revaluation of the dollar. His programme had a scope never before approached in time of peace. When Congress adjourned June 16, after heeding all his principal recommendations, the nation had been placed squarely upon a new path.

Mr. Roosevelt's administration then entered upon a different phase. His primary task for the next three years was to administer the legislation already obtained. Since his genius was for originating rather than executing, his record was uneven. The Agricultural Adjustment Administration under Secretary Henry A. Wallace proved highly efficient. Its crop restriction plans, together with two great droughts, relieved the farmer of the incubus of crop surpluses and restored prices. When the Supreme Court struck down the A. A., Mr. Roosevelt and Mr. Wallace had a substitute scheme ready for immediate operation. Mr. Roosevelt was less fortunate when he placed the National Recov-

ery Administration under General Hugh Johnson, whose attempt to carry the code system into all industries and to resort to moral coercion brought the law into discredit. When the Supreme Court held the Recovery Act unconstitutional (May 27, 1935), Mr. Roosevelt expressed bitter disappointment and indicated a temporary disposition to seek an amendment to the Constitution conferring enlarged power in social and economic spheres upon Congress. But public opinion was chilly and he abandoned the idea. He made excellent appointments for administering the Tennessee Valley Authority (Dr. Arthur Morgan) and the Securities Commission (Mr. Joseph P. Kennedy); his choice of Mr. Harry Hopkins as principal agent in charge of relief was also sound, though he was not able to prevent costly bickering between Mr. Hopkins and Secretary Harold L. Ickes. His administration at first moved too rapidly for the civil service merit system, but the attacks on its alleged subservience to spoilsmen were grossly exaggerated.

While busy with administration Mr. Roosevelt continued to demand new measures of social and economic reconstruction. One of the most important was the Gold Reserve Act of January 1934, under which he devalued the dollar to 59.06 cents in terms of its former gold parity. A measure close to Mr. Roosevelt's heart, the Utilities Act, designed to end abuses in the organization of huge holding companies, became law Aug. 26, 1935. It was essentially an attack upon one of the most complicated and mischievous forms of quasi-monopoly in the postwar period. Still more important was the Social Security Act, passed in August 1935. Setting up two great Federal-State systems for unemployment compensation and contributory old-age insurance, it obviously required amendment in the light of future experience, but held great social possibilities. Meanwhile Mr. Roosevelt on June 19, 1935, urged legislation to effect a wider distribution of wealth, calling for two sets of measures: one (inheritance taxes, high income surtaxes, abolition of tax-exempt securities) to halt the accumulation and transmission of great fortunes; the other (graduated corporation income taxes, holding-company taxes, and taxes on unwieldy corporate surpluses) to limit the concentration of power in big business. A highly controversial tax law shortly embodied some of these proposals.

Mr. Roosevelt's views on national policy were never left in doubt. He was an earnest advocate of national planning; but by this he meant not the regimentation of society, but only a constant use of foresight in dealing with national problems. He was hostile to great accumulations of wealth; suspicious of efforts by large-scale business to manipulate the government; eager to give better treatment to the farmer as against urban industry, and to labour as against capital; a believer in constant experimentation in government; certain that a more co-operative, less individualistic society must come into existence. In a time when conflict of opinion was violent, his way of zigzagging between "right" and "left" perhaps gave him a maximum of public support. His method of pushing reform, as the Securities and Exchange Act and other laws showed, was to ask for maximum remedies, then accept modifications as experience showed them necessary.

The Democratic national convention renominated Mr. Roosevelt by acclamation June 27, 1936, and the balloting on Nov. 3 resulted in what was probably the most sweeping victory in all American elections, a popular plurality of 11,069,785 votes, and an electoral vote of 523 to 8 for Alfred M. Landon, governor of Kansas.

A political precedent as old as the republic was broken July 18, 1940, when Mr. Roosevelt was nominated by the Democrats for a third term. He was elected the following November 5 by 27,247,939 votes to 22,327,226 for Wendell L. Willkie. In 1944 he was elected to a fourth term, defeating Gov. Thomas E. Dewey of New York. Although Roosevelt's plurality was only slightly more than 3,000,000 votes, he won 432 electoral votes to Dewey's 99. Franklin D. Roosevelt died on April 12, 1945, at Warm Springs, Ga. (For events of the second and third Roosevelt administrations, see UNITED STATES.) (A. N.; X.)

ROOSEVELT, THEODORE (1858-1919), 26th president of the United States, was born in New York city on Oct. 27, 1858. His father, Theodore Roosevelt, was of a Dutch family

conspicuous for centuries in the affairs of the city of his birth; his mother, Martha Bulloch, came of Scotch-Irish and Huguenot stock, which had given men of distinguished quality to the service of Georgia and the South. Young Roosevelt's ill-health necessitated tutors and withheld him from the rough-and-tumble companionship of boys his own age; but deliberately and with great persistence, he built up his frail body. He was graduated from Harvard in 1880 and the same year married Alice Hathaway Lee, of Boston. At the Columbia Law school, and in the office of his uncle, Robert B. Roosevelt, he prepared himself for the bar. But the law did not attract him. His interest lay rather in literature, in natural history and in the prospect of useful and strenuous activity, which the world of politics presented. Against the counsel of his friends who urged that politics was a "dirty business" Roosevelt joined a local political club. His associates there were his first political mentors, they guided him (1881) through his initial campaign for the State legislature. Within six weeks of the opening of the session, Roosevelt made his mark at Albany when he offered a motion to impeach a certain highly respectable judge who had proved over-lenient to a group of notorious financiers. He was sharply and at last successfully opposed, but his characterization of the sinister forces behind a corrupt legislature as "the wealthy criminal class" stuck in the public mind. Roosevelt was in the New York assembly three years; and in 1884 his party's candidate for speaker. He became the acknowledged leader of a small but potent group of young men who felt keenly the need of a new spirit in political life and were willing to fight both in the legislature and within the Republican party to keep the corrupting influences in check. As chairman of the New York delegation to the Republican convention in Chicago in 1884, Roosevelt supported the candidacy of Sen. George F. Edmunds, and with vigour and courage opposed the nomination of James G. Blaine. But when Blaine was chosen Roosevelt refused to desert the party, contending that Blaine, having been fairly nominated, had a right to the support of all loyal Republicans. It became clear to him that, for the moment at least, his political career was ended. The death of his wife early in 1884, following the birth of a daughter, had been followed 12 hours later by the death of his mother. When the campaign was over, therefore, he betook himself to the ranch which he had established the previous autumn in Western Dakota. For three years he lived a ranchman's life, and at odd moments wrote biographies of Thomas H. Benton and Gouverneur Morris. Within six months of his coming, he virtually took the leadership of the forces of law and order in the region, organized a protective association to check the cattle-thieves and did active duty as deputy-sheriff. A call from the Republicans in New York city to be their candidate for mayor brought Roosevelt back into politics in 1886. The widespread fear on the part of the propertied classes that Henry George, the candidate of the United Labor party, might be elected caused many Republicans, however, to vote for Abram S. Hewitt, the Democratic nominee, who was chosen, Roosevelt running third.

Official Appointments.—Immediately after the election, Roosevelt married Edith Kermit Carow, a friend of his childhood, and thereafter made his home at Sagamore Hill, near Oyster Bay, L.I. It was his intention to devote himself to literature; but his interest in public affairs drew him again into political life. In 1889, President Harrison appointed him a member of the U. S. Civil Service commission in Washington, and for six years he directed the battle against the entrenched defenders of the "spoils system." He left the Civil Service commission in 1895 to become president of the police board of New York city. On the force money ruled, politics ruled; merit was only incidentally a consideration in appointments. Roosevelt built up the *morale* of the force by substituting a system of appointment and promotion by merit; by rewarding bravery and devotion, by swiftly punishing negligence and venality and by enforcing the laws regardless of "pressure." The politicians of both parties opposed him; all the sensational, and most of the "respectable" newspapers derided or scolded him.

The election of William McKinley to the presidency brought

Roosevelt back to Washington as assistant secretary of the navy. He had since his first entrance on the political scene been an ardent advocate of preparedness. He frankly favoured a strong foreign policy and looked forward, in fact, to the ultimate withdrawal of the European powers from the Western Hemisphere. The conditions in Cuba had long convinced him that war with Spain was inevitable. With vigour, he set to work to make the navy ready. He reorganized the system of rank and promotion among naval officers; he adjusted the differences between the "line" and the "engineers." When the United States battleship *Maine* was blown up in Havana harbour on Feb. 15, 1898, Roosevelt sharpened his efforts. During a temporary absence of his chief, John D. Long, he took it upon himself to instigate the preparations which he had in vain asked the secretary of the navy to make. He ordered great quantities of coal and ammunition, directed the assembling of the American fleet, stirred the arsenals and navy yards to activity and, finally, cabled Commodore George Dewey what would be expected of him in case war came.

The Spanish War.—On the outbreak of hostilities, in April, Roosevelt resigned from the Navy Department and joined with his friend, Leonard Wood, a young army surgeon, to organize the 1st U. S. Volunteer Cavalry. The history of the Santiago campaign on the Spanish side is a history of incredibly inept generalship, and, on the American side, of inefficiency and blundering. Roosevelt, who succeeded to the command of the regiment on the promotion of Wood after the first fight, established himself in the affection of his men by his solicitous care for their welfare, and his insistence on sharing their occasional privations on equal terms. In the battle of San Juan hill Roosevelt personally led the cavalry division in the assault of the Spanish outpost known as Kettle Hill and from that position, at the head of his brigade, charged across an intervening valley and up the slopes of the ridge which was the enemy's main line of defence. The advance of the Rough Riders, as they were popularly known, lacked military form and was called "the school-boy charge" by officers of the regular army who led the orderly advance of the regiments of regular infantry which captured the San Juan blockhouse. But the imperious rush of Roosevelt and his men—joined by the 1st and 10th (coloured) cavalry, all dismounted—had a reckless and exultant sweep which contributed notably to breaking the Spanish spirit.

Governor of New York.—The Rough Riders were mustered out of service on Sept. 15, 1898. Two weeks later, the Republican party of New York State nominated Roosevelt as its candidate for governor. The party owing to scandals connected with the administration of the Erie canal had come into bad odour; and Thomas C. Platt, the Republican "boss" who distrusted Roosevelt as a radical of "altruistic" views, reluctantly agreed to his nomination. Roosevelt was elected by a scant majority, and instantly a struggle began between himself and Platt, but to fight him meant to accomplish absolutely nothing; for the State legislature was in the main in the hands of the astute Platt. Roosevelt solved the dilemma by yielding on points not involving fundamental principles and insisting on going his own way on all issues of real importance. Roosevelt remained governor for two years. He reformed the administration of the canals, making the canal commission non-partisan; he introduced the merit system into many of the subordinate offices of the State; he secured extensive legislation to provide better protection for the workers of the State, and laws in behalf of forest preservation, the protection of wild life, and the purity of food products. When, in matters of economic legislation, Platt proved obdurate, Roosevelt went to the public for support.

By this means he was able to secure (1899) from Platt's own legislature, against his plaintive protests and the angry opposition of the conservative press, the important Ford Franchise Act, taxing corporation franchises. His administration as governor remains significant in American political history because it marks the beginning of an effort on his part to secure the subservience to government and law of great business combinations. It became clear to Platt that his first apprehensions regarding Roosevelt had been only too accurate. He decided, therefore, to resist Roosevelt's desire to succeed himself

as governor by lifting him into the honourable seclusion of the vice-presidency. Neither President McKinley nor Senator Hanna, his astute political guide, approved the idea; Roosevelt and his Eastern friends laboured hard to prevent his nomination, but his friends in the West, out of a real enthusiasm, played into the hands of the man who was plotting their hero's political demise. The combination proved irresistible. McKinley refused to intervene and Roosevelt was nominated. He spoke a little ruefully of having "taken the veil," and made plans to beguile the dreary boredom of the vice-presidency with the study of law.

ROOSEVELT AS PRESIDENT

President McKinley was shot in Buffalo on Sept. 6, 1901, and died Sept. 14. On the same day Theodore Roosevelt took the oath as president of the United States. His sudden accession to power caused a flutter of apprehension in the ranks of what was known as "Big Business." The new president was, as a matter of fact, by nature a conservative, but he wore his conservatism with a difference, standing as far removed from the reactionary position of men like Platt and Hanna, as he was from the radicalism of Bryan. He recognized what many of the spokesmen of capital refused to recognize, that true conservatism demanded a just re-appraisal of industrial and economic conditions and prompt, far-reaching remedial action. On Feb. 18, 1902, he threw what was in effect a bomb into the financial world, when he announced through his attorney general, Philander C. Knox, that he had brought suit in behalf of the United States for the dissolution of a holding corporation known as the Northern Securities Company. The announcement caused consternation among such financiers as J. P. Morgan, Edward H. Harriman and James J. Hill. The holding company was a device designed by shrewd legal minds to evade the restrictions of the Sherman anti-trust act of 1890, and was generally regarded as impregnable. In the Knight case (1895) involving the American Sugar Refining Company, the Supreme Court had, in fact, held that Congress was without constitutional power to forbid it.

Campaign Against Financial Interests.—When Roosevelt came to the presidency, the average American was moving rapidly toward the cynical conclusion that there was one law for the corporations and another for the individual; one law for the rich, another for the poor. The corporations carried on their existence in a kind of "twilight zone" between State and Federal authority, where neither seemed able to reach them; and when finally a body so revered and so obviously incorruptible as the Supreme Court admitted that Congress was powerless to check the growth and extension of the power of organized wealth, the common man began to wonder whether he would have to seek a corrective which other peoples had found effective. "The United States," said the *New York World* years later, "was never closer to a social revolution than at the time Roosevelt became president." Roosevelt, made aware of the danger first by the campaign of 1896, recognized that the fundamental principles of democratic government—equal justice and national solidarity—were being undermined and that on the outcome of the struggle between the financial powers and the government depended the future vitality of American Government. His vision and courage were vindicated by the courts which he had invoked. On April 9, 1903, the U.S. circuit court, sitting at St. Louis, ordered the dissolution of the Northern Securities Company; and on March 14, 1904, the Supreme Court affirmed the decree.

The anthracite coal strike in 1902 brought the menace of popular unrest to the surface. The miners, under the leadership of John Mitchell, were insistent in their demands; the operators led by J. P. Morgan and George F. Baer, president of the Philadelphia and Reading Railway, were obdurate. Roosevelt for the first time asserted the right of the President to act as representative of the public in an industrial dispute. The miners agreed to arbitrate, but the operators were indignant at the President's "interference" in what they regarded as their private concern. Roosevelt saw clearly what the operators failed to see, that the labour problem had entered upon a new phase; that the growth of industry necessitated a new approach to the questions affecting it; that

the public was in no mood to suffer for the inability of the operators to recognize the parity of human rights with the rights of property, and that in a winter of coal famine lay the possible beginnings of irreparable discontent. After a long-drawn struggle he succeeded in impressing these views upon the operators.

The initiation of the Government's suit against the Northern Securities Company marked the beginning of a conflict between Roosevelt and the large financial interests which continued unabated throughout his administration and for years thereafter, until the outbreak of the World War (1914) brought a shift of issues and a truce. The business leaders were convinced that the President was a destroyer, and was shaking the foundations of the social structure and undermining the institution of private property. His objection, in regard to corporations, as he frequently pointed out, was not to size but to wrongdoing. In swift succession, the President ordered suits brought against the United States Steel Corporation, the Standard Oil Company, the American Sugar Refining Company and other powerful combinations. Meanwhile, he inspired important legislation involving the regulation of railroads. The Elkins law (Feb. 19, 1903) forbade rebates; the Hepburn rate bill (June 29, 1906) granted the interstate commerce commission the right to fix railroad rates. A Pure Food bill, forbidding the manufacture, sale or transportation of adulterated foods, drugs, medicines and liquors, became law on June 30, 1906; the following day another act, providing for the inspection of stockyards and packing-houses, was signed by the President. An Employers' Liability act was adopted. A department of commerce and labour, including a bureau of corporations, was established by congressional action on Feb. 14, 1903. President Roosevelt strengthened his position in reference to the excesses and transgressions of corporations by settling himself with equal firmness against the violence of labour agitation. He noted that the hunger for special privilege was not limited to the ranks of capital. He was by nature sympathetic to the labouring man and scrupulously fair to his interests, but struck at him fearlessly when he thought he was wrong, linking two advocates of violence in the ranks of labour on one occasion with a law-dodging railroad magnate, as "undesirable citizens."

Conservation.—Early in his administration, with the purpose of breaking the strangle-hold of a small minority on the sources of wealth which should be open to the honest endeavours of all the people, the President—under the guidance of Gifford Pinchot—embraced the policy of conservation. The established theory in regard to the national resources was that the general prosperity of the country could best be advanced by the development of these resources by private capital, and upon this theory land was either given away or sold for a trifle. Under this policy, over wide areas, the timber-lands had been stripped bare with reckless waste; the control of the nation's water power had to a dangerous extent passed into private hands; and the public grazing lands and the wealth in minerals and oil in the public domain were bringing enormous dividends to a few, but no returns whatsoever to the people as a whole to whom these natural resources belonged.

Under Roosevelt's administration the area of the national forests was increased from 43 to 194 million acres, the water power resources of those areas were put under government control to prevent speculation and monopoly, and cattle-raisers grazing their herds on the reserves were forced to pay for what they got. In March 1907 Roosevelt created the Inland Waterways commission, and in May 1908 held a conference of State governors at the White House in behalf of conservation. As a result of this conference he appointed a national conservation commission to prepare an inventory, the first ever made for any nation, of all the natural resources within the territory of the United States. A Joint Conservation Congress held in Dec. 1908 was followed by a North American Conservation conference in Feb. 1909. The movement for the reclamation of land either excessively or insufficiently watered was essentially a part of the effort in behalf of conservation. It received congressional sanction in the Reclamation Act (June 17, 1902) and achieved its most noteworthy result in the building of the Roosevelt dam in

Arizona, which, by impounding the waters of the Salt river, turned a desert into one of the most fertile farming districts in the world. No policy of Roosevelt's administration excited deeper public interest or sharper opposition than his efforts in behalf of conservation. His official acts and the influence of his speeches and messages led to the adoption by both citizens and government of a new theory regarding natural resources. It is that the Government, acting for the people who are the real owners of public property, shall permanently retain the fee in public lands, leaving their products to be developed by private capital under leases which are limited in their duration and which give the Government complete power to regulate the industrial operations of the lessees.

Re-election.—The popularity which Roosevelt enjoyed at the end of his first term found emphatic expression in the election of 1904. By the largest majority which, up to that time, had been accorded any candidate, Roosevelt was chosen to succeed himself in the White House, receiving 7,623,486 popular votes and 336 electoral votes, against 5,177,971 popular votes and 140 electoral votes cast for Alton B. Parker, the Democratic nominee.

Foreign Policy.—Roosevelt's warfare with the forces popularly symbolized as "Wall Street" was punctuated at intervals during his administration by actions in the realm of international relations which greatly stimulated national pride. The President was brilliantly assisted in his conduct of foreign affairs, first by John Hay and then by Elihu Root, but he was in reality his own Secretary of State. His policy in regard to the army and navy was a highly important part of his foreign policy. He believed in the virtue of being ready as a preventive of war, pointing out the results of unpreparedness in the preface to his first book, *The History of the Naval War of 1812* (1882), and urging an effective army and navy in many of his later writings. He increased greatly the general efficiency of the army. His promotion of officers for merit in defiance of the rules of seniority and his order directing officers to demonstrate their ability to ride 90 m. in three successive days caused some criticism, especially in the more conservative element in the army. Roosevelt's services as Assistant Secretary of the Navy contributed vitally to the distinguished success of the American fleets during the Spanish War. As President he sought with great persistence to build up the navy's power and to make it as effective as possible, giving younger and more progressive officers the prestige of his support in their struggles within the service. When in 1907 he sent the battleship fleet around the world—against the advice of experts in naval construction—he did so partly to call the attention of the great powers, notably Japan, to the fighting strength of the United States, and partly to dramatize the navy and its needs to the American people. The voyage was brilliantly successful.

The attitude of Roosevelt in foreign affairs as in domestic was frank, clear-cut and firm. He knew the involutions of international politics in the Old World as no American president before him had known them, and he countered and checked his subtle opponents in diplomacy with skill and relish. He was bold—startlingly bold at times—but never reckless, calculating costs in advance, saying unambiguously what he had to say and taking account of the human equation. His handling of the German emperor in the matter of Venezuela in 1902 was so firm and so courteous that the emperor became his devoted admirer even though he recalled the ambassador who had failed to warn him that the President meant what he said. His action in regard to an old dispute with Great Britain over the boundary of Alaska was equally friendly and effective.

Swift and vigorous was his action (1903) in sending a cruiser to Panama immediately following its secession from Colombia. He was one of the first Americans to apprehend the part which the Pacific was destined to play, both commercially and politically, in world history. The long delay, moreover, during the Spanish War, in bringing one of the navy's greatest battleships, the *Oregon*, from the Pacific coast of the United States to the Atlantic, had convinced Roosevelt of the urgent need, if only for strategic reasons in the event of war, of a canal across the

Isthmus of Panama. When, therefore, after years of fruitless negotiations, the opportunity came to him to acquire for the United States the right to build the canal, he acted promptly, convinced that to do otherwise was to invite a new and dangerous succession of postponements.

The charge was made that President Roosevelt had encouraged or even fomented the revolution in Panama; but no evidence has been produced to give the accusation the slightest support. Roosevelt's boast (1912) "I took Panama," must, moreover, be considered in conjunction with a phrase he added at the semi-jocular request of a French engineer who himself claimed the credit and the responsibility for the insurrection—"when Bunau-Varilla handed it to me on a silver platter." Roosevelt's leadership in the actual construction of the canal was of vital significance. When private engineers failed in the task, he appointed an army engineer, Col. George W. Goethals, as head of the Canal commission with autocratic powers. He broke the precedent which was supposed to prevent an American president from leaving the territory of the United States during his term of office in order to inspect the work and encourage the workers.

Roosevelt approved and eloquently defended the policy of national expansion adopted by the Government under President McKinley. Aside from the acquisition of the Canal Zone, however, he made no move to acquire further territory for the United States. To the surprise of Europe, he carried out the provisions of the American pledge not to annex Cuba, and launched that long-oppressed people as an independent republic under the protection of the United States but not under its Government. By assuming supervision of the finances of San Domingo, he put an end to controversies in that unstable republic which threatened to disturb the peace of Europe.

Roosevelt's action in bringing about peace between Japan and Russia in 1905 added greatly to his prestige at home and abroad. Portions of Roosevelt's papers, published since his death, reveal the extent to which international politics on the Continent were involved in a struggle which appeared to be localized in the Orient and indicate that it was Roosevelt's intervention which prevented in 1904 and again in 1906, during the Algeiras Conference, the outbreak of the World War which actually came in 1914. The Nobel Prize committee recognized his services in ending the Russo-Japanese War by conferring upon him in 1906 its award for the promotion of international peace. In accepting the honour in an address at Christiansia in 1910, he suggested the possibility of a League of Nations for the prevention of war. He was the first to send an international controversy for settlement to the International Court of Arbitration at The Hague and was instrumental in having the Second Hague Conference called. He was opposed, however, to peace treaties which promised more than human nature could be counted upon to fulfil, and had no patience with any policy remotely resembling "peace at any price."

His administration had a profound effect on the national prestige of his country. He found the Government of the United States, when he took up the reins, in the position among world powers of a new boy in school; he left it firmly established in the first rank, admired and feared, its favour sought after, its citizenship respected in the remotest corners of the globe.

Home Affairs.—In domestic affairs his influence was even more far-reaching. His success in drawing the leaders on both sides of the social and economic struggle back from the danger zone where extremes meet in violent disturbance was possible only because he had to an unprecedented degree the support of the public, regardless of party. His vigour, his courage, his abounding vitality, his lack of presidential pomposity, his familiarity with all manner of men, even his loudness of action or utterance, and his undisciplined delight in driving the "band wagon," all endeared him to "plain folks." He entered into men's lives, kindled fires in them, impelled them to scorn ease and safety and rejoice to do the fine, the difficult thing. His power to inspire his followers to take a pride in their country and her welfare brought to his side hundreds of young men of ability, who asked no greater privilege than to serve under him in an enterprise which in its details was prosaic enough but which he had somehow invested

with the spirit of high adventure. The President gave them work to do in the Federal departments and in the island possessions. Their high quality impelled the British ambassador, James Bryce, an acute observer of governments, to remark to Roosevelt that he had "never in any country seen a more eager, high-minded and efficient set of public servants, men more useful and creditable to their country, than the men then doing the work of the American Government in Washington and in the field." Roosevelt had, indeed, the gift of stimulating men to raise themselves for the moment above the ordinary level of their abilities and their desires.

SCIENTIFIC EXPEDITIONS AND TRAVELS

In March, 1909, Roosevelt retired from the Presidency. He adhered to a pledge which he had made after his election in 1904 not to accept the nomination for the Presidency in 1908, and gave his support to the candidacy of William H. Taft, his Secretary of War. Taft was nominated and elected. On April 23, 1909, Roosevelt, accompanied by his son Kermit, sailed for Africa on a scientific expedition under the auspices of the Smithsonian Institution in Washington.

Africa.—Roosevelt entered Africa at Mombasa, and for ten months, moving slowly northward, he hunted big game and collected specimens. He was a keen naturalist, accepted by scientists in his field as a trustworthy observer who had added substantially to the study of American fauna. He had a memory which all who came in contact with him agreed was astonishing in its tenacity and accuracy; and for one who had given only the off-hours of a busy life to scientific study, his knowledge was wide and thorough; but he recognized its limitations and humbly yielded to instruction.

Roosevelt emerged from the wilderness at Gondokoro at the end of Feb. 1910. Nothing showed better the fascination which he exercised over the imaginations of men the world over than the interest which his reappearance created. An address at Khartoum on orderly government created a mild stir, but another address, delivered before the students of the University of Cairo, denouncing the assassination by nationalists of the pro-British premier, Boutros Pasha, brought him threats of assassination.

Europe.—Roosevelt's journey northward was in the nature of a triumphal procession. An official at the Vatican precipitated an unpleasant situation by stipulating certain conditions for an interview with the Pope, but Roosevelt's refusal to permit any limitation on his freedom of action was direct and emphatic. In Paris he made a public address at the Sorbonne on "Citizenship in a Republic," in Berlin he spoke at the University on "The World Movement," and, at the emperor's side, reviewed the Imperial Guard, the first civilian who had ever reviewed German troops.

Before he reached England, the king, Edward VII, died, and when Roosevelt arrived in London it was as President Taft's special ambassador to the funeral. His Romanes lecture at Oxford on "Biological Analogies in History" was widely praised, but a speech at the Guildhall in London in which he criticized what appeared to him as the timid ineptitude of the British Government in Egypt brought sharp rebukes from both sides of the Atlantic, but had the endorsement of the new king and of his Foreign Secretary. The address had certain momentous consequences in the appointment of Lord Kitchener as consul general to Egypt (in effect, governor) and the strengthening of a British position which, through its control of the Suez canal and the road to India, became of vital importance to the British Empire on the outbreak of the World War four years later. What remained to Englishmen, however, as the most striking memory of Roosevelt's stay in England, was the walk he took through the New Forest with Sir Edward Grey, when he proved that, though he had spent less than a month altogether in England since his boyhood, he could identify every bird which he saw or heard.

THE RETURN TO POLITICS

Roosevelt returned to the United States on June 18, 1910, disembarking at New York, and received a tumultuous welcome. He had already been put in touch with the political situation.

The struggle between the conservative and the progressive elements in the Republican party, which under Roosevelt had remained under the surface, had, under President Taft, developed into what threatened to become a definite schism. A new tariff law, the dismissal of certain commissions which Roosevelt had appointed, the President's position in a bitter controversy regarding western lands, and the general mood of the Administration led Roosevelt to believe that Taft, instead of carrying forward the policies of the former administration, was definitely aligned with their opponents.

Security for Roosevelt and his fame lay in his retirement to his home acres as a kind of national sage; but at the request of the governor of New York, Charles Evans Hughes, he plunged into a factional fight within the Republican Party in the State (1910) and was sharply defeated. In numerous addresses in many parts of the country, however, and in the columns of the *Outlook*, a weekly periodical of which he was "contributing editor," Roosevelt carried forward his fight for what he called the new nationalism; a struggle for "social justice and popular rule," the control by the people of their political instruments and their government for the purpose of providing a condition approximating equality of opportunity. "The new nationalism" was denounced as revolutionary; it was, in fact, essentially conservative, seeking, as it did, merely a reinvigoration of established American institutions. Certain mildly radical expedients which it proposed were: the recall of elective officers by popular vote, the referendum, intended to make the legislatures more directly responsive to the popular will, and the direct primary. The recall of judicial decisions, advocated by Roosevelt as a check on the reactionary tendency of the judiciary in its function as the interpreter of the constitution, frightened the conservatives. As the struggle between the two factions in the Republican Party became increasingly bitter, pressure was brought to bear upon Roosevelt to declare himself a candidate for the presidency; and on Feb. 25, 1912, to use his own phrase, he "threw his hat in the ring."

It was not in Roosevelt's nature, once he had entered a struggle of any sort, to strike with cushioned gloves. The quarrel between Roosevelt and Taft, brought into the open by the contest for delegates, proved distressing alike to the friends of the protagonists and to the general public. In the 13 States where presidential primaries were held, the result, however, gave evidence that the majority of the Republican voters wanted him as their candidate; for of 362 delegates thus selected, 278 favoured Roosevelt and 48 Taft. The President's strength, in fact, came largely from States which cast a very small Republican vote and in which the control of the political machinery was in the hands of the office-holders. In many cases, the progressive voters named protesting delegations who appeared before the Republican National Committee in Chicago before the convention met (June 22, 1912) to claim the seats which they declared had been fraudulently assigned to their rivals. By a margin of 13 votes—which were offered to Roosevelt, but on terms which he felt he could not accept—the convention was organized by his opponents.

In the stirring events of the convention—though not in the hall itself—Roosevelt played the dominant part. He was ready to agree on a compromise candidate, but only on condition that the rolls of the convention be purged of those delegates who, he insisted, had been fraudulently seated. The convention nominated Taft, and the defeated elements, under the leadership of Roosevelt, formed the Progressive Party. Its first convention, held in Chicago early in August, proved unique in American political history in the fact that women were admitted as delegates. Roosevelt announced the principles of his party, demanding what he had fought for throughout his presidency—the control of the government and the resources of the United States by the people rather than by the professional politicians and financiers; asking, in effect, for a return to fundamental principles. On Aug. 7, the convention nominated Roosevelt for president and Hiram Johnson of California, for vice-president. The Democrats, meanwhile, meeting in Baltimore, had nominated Woodrow Wilson for president. During the campaign, both Wilson and Taft concentrated their artillery on Roosevelt. At the height of the campaign,

on Oct. 14, Roosevelt was shot by a maniac in Milwaukee as he was getting into the automobile which was to take him to the hall where he was to speak; he insisted, however, on making his address and it was an hour and a half before he consented to be taken to a hospital. In the election, Wilson received 435 electoral votes, Roosevelt 88 and Taft 8. The popular vote was 6,293,097 for Wilson; 4,110,597 for Roosevelt; 3,484,956 for Taft, and 901,873 for the Socialist candidate, Eugene V. Debs.

RETIREMENT

Roosevelt had expected defeat and it brought no bitterness. He returned to his editorial work on the *Outlook*, wrote his *Autobiography* and only interrupted the life of a country gentleman to move upon a little town in Michigan with a score of "character witnesses" in May, 1913, to confound the editor of a magazine called *Iron Ore* who had rashly put in print a charge widely current, that the ex-president was occasionally or, in fact, frequently, drunk. The defendant admitted that he had combed the country in vain for witnesses to substantiate his charge, acknowledged his error and paid the six cents in damages which was all Roosevelt would accept.

In the autumn of 1913, Roosevelt went to South America to address numerous learned bodies and to secure specimens in the jungles of Brazil for the American Museum of Natural History. His journey from capital to capital—a repetition of his triumphal progress through Europe—belied the theory that his action as President regarding Panama had angered the South American peoples. At the suggestion of the Brazilian government and accompanied by a gallant Brazilian explorer, Col. Candido Rondon, he set out to determine the course of a hitherto unknown river, vaguely indicated on existing maps as the River of Doubt. The journey of 900 m. through primeval wilderness was arduous and full of peril, with death by starvation awaiting the expedition if it went too slow; and death in the rapids waiting if it went too fast. Canoes were crushed in the treacherous waters; supplies were lost; fever made sharp inroads. Finally Roosevelt himself was taken desperately ill, but he struggled forward, until at last, when disaster seemed inevitable, the party reached civilization at the confluence of the river they had charted with the Madeira, a tributary of the Amazon. In honour of the exploit the Brazilian government christened the stream the Rio Roosevelt.

The World War.—He returned to the United States in May 1914. Early August brought the catastrophe in Europe which, as President, he had foreseen and postponed. His sympathies were with France and England, for he distrusted the German emperor whose imperious and unstable mind had during his presidency caused him frequent irritation and anxiety; but he maintained for a few weeks a neutrality in utterance if not "in thought," which he later regretted. But before September was over, he was once more in the centre of public discussion and debate. He saw earlier than the leaders of the administration in power that America could not remain untouched by the gigantic struggle, since any disturbance of the existing balance of power would have a profound effect not only on the foreign relations of the United States but on the personal lives of the American people. America could afford to see England, France and their allies win, but she could not afford to see Germany win, for a German victory implied an aggressive neighbour in Canada and in the Caribbean and the adoption by the United States of the European condition of an "armed peace." He wanted America to enter the war on the side of the Allies because he was convinced that if she did not accept the gage of battle at that time, she would have to accept it later under less favourable conditions. He pleaded for preparedness, but he went beyond the immediate need to what he was convinced was the ultimate necessity—an international tribunal backed by force to execute its decrees. He attacked the divided allegiance—"fifty-fifty Americanism" was his phrase—which permitted certain Americans of German origin to praise all things German at the expense of the American institutions under which they lived; but at the same time he pleaded for justice for the German-American who kept his head and was loyal.

The destruction of the *Lusitania* by a German submarine brought from Roosevelt a scathing denunciation of German methods of warfare, and successive attacks on what seemed to him the timid and inept statesmanship of the Wilson administration. There was a kind of berserker fury in these attacks. Between himself and his opponents in power he knew no middle ground of compromise and party truce; the issues that divided him from them were to his mind not political but moral. It seemed to him that Wilson was deliberately lulling the public into a sense of false security, permitting it to dissipate its spiritual energies in an orgy of acquisition while their president set about with gestures and phrases to exorcise an opponent both aggressive and armed. Once more Roosevelt appealed to the public conscience, and stirred it as never before.

In this last struggle of a stormy life, he rose to what seemed to many of his countrymen new heights of devotion, as he pleaded for the defence of those institutions which he had as president himself revitalized. "Let us pay with our bodies for our souls' desire!" The shift of issues had brought to Roosevelt's support many of the men who had been his bitterest enemies, and early in 1916 he was put forward as a candidate for the Republican nomination for president. He warned the public that he must not be nominated unless the nation were in an "heroic mood." An effort was made by the Progressives to persuade the Republicans to join them in nominating Roosevelt, but the majority of the Republican delegates were not ready to forgive the schism of 1912, and his suggestion that Gen. Wood be named as a compromise candidate never reached the convention. Roosevelt refused the nomination of the Progressive Party, and gave the Republican nominee, Charles Evans Hughes, his support.

When the United States entered the war in April 1917, "the Colonel" as he was affectionately known, offered to raise a division of volunteers from among the ranks of the "outdoor men" of the country who would be almost immediately ready for service; 250,000 men recorded their desire to go under his leadership to France and Congress passed a bill authorizing the creation of two divisions of volunteers, but the President refused his consent. "This is a very exclusive war," Roosevelt remarked, "and I have been blackballed by the committee on admissions." His four sons all went to the front; two were wounded, one Quentin, the youngest, a lieutenant in the Air Service, was killed in combat over the German lines. Roosevelt, forbidden to fight in the field, grimly and in bitter disappointment flung himself into the work that lay at hand. Here and there over the country he spoke for the Liberty Loan campaign, for the Red Cross and other relief agencies, and in the pages of the *Kansas City Star* and the *Metropolitan Magazine* fought week after week for speed in military preparation, for an honest facing of facts and for whole-hearted and unreserved participation in the war by the side of the allies, greeting the Administration's satisfaction over the "happy confusion" of the war preparations with words of stinging realism.

The fever he had contracted in Brazil returned now and again. For weeks he travelled and made public addresses in spite of it. In Feb. 1918, however, he became dangerously ill; was operated upon, recovered, returned to his full activity and was again laid low. His illness scarcely abated his ceaseless activity and in nowise seemed to weaken the force of his fighting spirit. At no previous period in his career was his following so large or so devoted. It seemed as though, in the intensity and grief of the war-years, his countrymen turned to him with new understanding and affection. While scholars talked of this or that notable act of an administration which was already acquiring a kind of glamour in the perspective of a decade, the common man called him "the great American" and let others analyse why. He died in his sleep on Jan. 6, 1919.

Character and Influence.—It can be said of Washington that he founded the American nation, and of Lincoln that he preserved it; it can be said of Roosevelt that he revitalized it. Twice, at critical times, through his vision, his ardour, his effective anger, his faith in American institutions and his peculiar understanding of all sections of the American people, he cleansed the body of the nation of treacherous poisons, and set its soul to work on labours

higher than the acquisition of physical comforts. He dreamed nobly for his country and impelled millions of his countrymen to dream nobly. Roosevelt was one of the most versatile presidents of the United States. In addition to his talents as a politician, statesman and popular leader, he was eminent as naturalist, soldier, orator, historian; and was one of the most widely-read men of his time. *The Winning of the West* has faults of hasty composition inevitable in a book written in the off-hours of a crowded life, but it maintains its authority; his *Naval History of the War of 1812* has not been supplanted as the leading work on the subject. He was an assiduous and occasionally a brilliant writer. His narratives are lucid and swift, his descriptions full of colour and significant detail, his literary criticism straightforward and free from the jargon of the craft. His letters have taken a high place in epistolary literature; his volume of *Letters to his Children* is already a classic. His political writings, moreover, are direct and clear, open to the most untutored intelligence, and flashing at intervals with arresting epithets. Under the stress of emotion, in some of the prefaces of his hunting books, in a descriptive passage here and there—in his appeal, for instance for imagination in the writing of history—his prose became transmuted into the gold of poetry.

"A man who could do so much could not do everything perfectly, though few have ever done so many things so well," wrote his friend Albert Bushnell Hart (*Encyclopædia Britannica*, 12th edition). "It was more true of him than of most men that his defects were inherent in his virtues. There were few half-tones in Roosevelt's moral perceptions and fewer in his vocabulary; he saw things as either black or white, and he forgot sometimes that he had not previously seen them as he saw them at the moment. . . . The very intensity of his convictions sometimes blinded him to the sincerity and even to the justice of other points of view. Nevertheless, this intensity, this moral fervour, gave his ideas a momentum and a success which they could never have acquired had they proceeded from a more judicial mind. He scorned 'weasel words,' and on occasion he did not hesitate to describe his enemies as thieves and liars. His remarkable energy reminded observers of some great elemental force which, like any natural phenomenon, is controlled by its own necessary laws."

Writings.—Theodore Roosevelt's published works, including books, pamphlets, addresses, campaign speeches, contributions to the books of others, translations and periodical articles, number between two and three thousand titles and date from 1877 to his death. During his life Theodore Roosevelt wrote not less than 150,000 letters, most of which were included with the Roosevelt papers in the Library of Congress in Washington, and there are a great number of published works dealing with his colourful life. There have been many collections of Roosevelt's works, including the Memorial edition, 24 vol. (1923-26); and the National edition, 20 vol. (1926).

Roosevelt's principal works are: *Naval War of 1812* (1882); *Hunting Trips of a Rauchman* (1885); *Thomas Hart Benton* (1887); *Gouverneur Morris* (1888); *Ranch Life and the Hunting Trail* (1888); *Winning of the West*, 4 vol. (1889-96); *New York* (1891); *Wilderness Hunter* (1893); *Hero Tales from American History* (with Henry Cabot Lodge) (1895); *American Ideals* (1897); *Rough Riders* (1899); *Oliver Cromwell* (1900); *Outdoor Pastimes of an American Hunter* (1905); *African and European Addresses* (1910); *African Game Trails* (1910); *New Nationalism* (1910); *Realizable Ideals* (1912); *History as Literature* (1913); *Progressive Principles* (1913); *Autobiography* (1913); *Through the Brazilian Wilderness* (1914); *Life Histories of African Game Animals* (with Edmund Heller) 2 vol. (1914); *America and the World War* (1915); *Book-lover's Holidays in the Open* (1916); *Fear God and Take Your Own Part* (1916); *Poes of our Own Household* (1917); *Great Adventure* (1918); *Theodore Roosevelt's Letters to his Children* (1919); *Theodore Roosevelt and his Time Shown in his Own Letters*, Ed. by J. B. Bishop, 2 vol. (1920); *Roosevelt in the Kansas City Star* (1921); *Letters to Anna Roosevelt Cowles* (1924); *Selections from Correspondence of Theodore Roosevelt and Henry Cabot Lodge* (1925).

Davis, *Released for Publication* (1924); H. F. Pringle, *Theodore Roosevelt. A Biography* (1931). For fuller record of Roosevelt's writings see R. W. G. Vall, *Roosevelt Bibliography* (1929). (H. HAG.)

ROOT, ELIHU (1845-1937), American lawyer and political leader, was born at Clinton (N.Y.), on Feb. 15, 1845. He graduated at Hamilton college where his father was a professor in 1864, taught at the Rome (N.Y.) academy in 1865, and graduated at the University Law school, New York city, in 1867. As a corporation lawyer he soon attained high rank and was counsel in many famous cases. Politically, he became identified with the reform element of the Republican Party. He was U.S. attorney for the Southern District of New York (1883-85), and a delegate to the State Constitutional Convention of 1894, acting as chairman of its judiciary committee. From Aug. 1899 until Feb. 1904 he was secretary of war in the cabinets of Presidents McKinley and Roosevelt, and in this position reorganized the army and created a general staff, and in general administered his department with great ability during a period marked by the Boxer uprising in China, whither troops were sent under Gen. A. R. Chaffee, the insurrection of the Filipinos, the withdrawal of U.S. troops from Cuba and the establishment of a government for the Philippines under a Philippine Commission, for which he drew up the "instructions," in reality comprising a constitution, a judicial code and a system of laws. In 1903 he was a member of the Alaskan Boundary Tribunal. In July 1905 he re-entered President Roosevelt's cabinet as secretary of State, where he considerably improved the consular service. In the summer of 1906, while attending the Pan-American Conference at Rio de Janeiro, he was elected its honorary president, and during a tour through the Latin-American republics, brought about a better understanding between the United States and these republics. In general he did much to further the cause of international peace, and he concluded treaties of arbitration with Japan, Great Britain, France, Italy, Spain, Portugal, Austria-Hungary, Switzerland, Norway, Sweden, Denmark, Holland and other countries. Upon his resignation from the cabinet he was elected, in Jan. 1909, as U.S. senator from New York. In 1910 he was chief counsel for the United States before The Hague Tribunal for the arbitration of the long-standing dispute concerning fisheries between his country and Great Britain. Upon his return, he was appointed by President Taft a member of the Permanent Court of Arbitration. In the same year he was elected president of the Carnegie Endowment for International Peace. Root thus took up again the work which he had initiated when secretary of State, and became the recognized leader of the peace movement in the United States. In 1912 he was awarded the Nobel Peace Prize. He strongly supported in the Senate the treaty of obligatory arbitration concluded between the United States and Great Britain in 1912, but failed to prevent amendments to the treaty being inserted by the Senate which prevented an exchange of ratifications.

He took a leading part in the passage of the Federal Reserve bill of 1913, providing for a Federal Bank under Federal control, in order to stabilize the finance of the country. In matters of foreign policy also his opinion had great weight. In 1915 a treaty negotiated by Secretary of State Bryan with Colombia provided for payment by the United States of \$25,000,000 to Colombia in settlement of all outstanding claims between the two countries

arising out of the independence of Panama; Mr. Root opposed ratification, principally because a statement of regret on the part of the United States had been inserted in the preamble, though he also considered the sum too much. His opinion prevailed, and later on, in 1922, when the Senate finally ratified the treaty, the clause in question was omitted.

On March 4, 1915, his term as senator expired and he declined to be a candidate for re-election. That summer he was president of the New York State Constitutional Convention, and advocated, among other measures, the short ballot, means for remedying the law's delays, the reduction of costs involved in the administration of justice and measures which would facilitate the impeachment of unworthy public officials. After the declaration of war by the United States, on April 6, 1917, he gave his whole support to the Government. He was asked by President Wilson to head the mission which was sent to Russia shortly thereafter with a view to encouraging the Revolutionary Government under Kerensky to carry on the war with vigour. He accepted, but while in Russia the overthrow of the Moderates there by the Bolsheviks under Lenin frustrated the purposes of his mission.

At the conclusion of the war, though not a member of the U.S. Mission to Paris to conclude peace, his advice was requested in the matter of the Covenant of the League of Nations and his views prevailed to a certain extent. To the Covenant as actually drafted, however, he was opposed. He was, nevertheless, of the opinion that the Covenant and the Treaty of Versailles should be accepted with reservations, to secure the interests of the United States, inasmuch as the President's re-election in 1916 and his presence as negotiator at Paris had led the other plenipotentiaries, however erroneously, to believe that he represented the opinion of his fellow countrymen. In Mr. Root's opinion it would be better to accept the Covenant with reservations, and by subsequent amendments to remove the obstacles which had originally stood in the way of its acceptance.

He accepted an invitation from the League of Nations to become a member of the Advisory Committee of Jurists which met at The Hague in 1920 for the purpose of devising a plan for a permanent court of international justice, in accordance with Art. 14 of the Covenant. His presence enabled the committee to frame a plan acceptable to all by which the judges were to be elected by the separate and concurrent action of the Council (in which the Great Powers had a preponderance) and the Assembly (in which the Small Powers were in a majority), each interest, real or alleged, having thus a veto upon the abuse of power by the other. The plan was accepted with modifications by the Council and Assembly on Dec. 14, 1920, and became the statute of the court. It functioned perfectly when the judges were elected in 1921.

Root was appointed by President Harding one of the U.S. delegates to the International Conference on Armament Limitation, which met at Washington in Nov. 1921. There he secured the adoption of the convention subjecting submarines to the requirements of surface vessels and prohibiting the use of noxious gases in warfare. He devised the Pacific agreements which resulted in the cancellation of the Anglo-Japanese alliance, and drafted the Four Power Pacific Treaty, which took its place. In Jan., 1929, he accepted an invitation to be a member of a committee of jurists meeting at Geneva to test and revise the original statutes of the Permanent Court of International Justice in the light of eight years' experience. He participated in every session held for this purpose and offered valuable suggestions. His main work, however, was the working out of a formula upon which the United States might see its way clear to become a member of the court. This Root protocol, as redrafted by Sir Cecil Hurst, was unanimously accepted by the committee of jurists, and was intended to replace the protocol of Sept. 23, 1926 drawn up in answer to the American Senate reservations. The changes made were only in the article on advisory opinions and were held to be favourable to the United States. The hope was general that the United States Senate would act favourably after the report of the committee had been formally accepted by the League Council, but the Senate rejected it. Mr. Root died Feb. 7, 1937.

A collection of Root's public addresses has been edited by Robert Bacon and James Brown Scott in eight volumes. He also published *Experiments in Government and the Essentials of the Constitution* (Princeton Lectures, 1911) and *American Ideals During the Past Half Century* (International Conciliation, no. 210, 1925).

ROOT, in popular usage, the part of the plant which is normally below the surface of the earth. Botanically its application is more restricted, for many plants develop subterranean structures that are in reality specialized stems (rhizomes, tubers, corms).

FROM STRASSBURGER'S "FLEISCHUCH DER WURZEL" (GUSTAV FISCHER).
FIG. 1. — SEEDLING (ULTIMATE ROOT-BRANCHES)

Not all plants have true roots; they are lacking in Thallophytes (algae and fungi) and Bryophytes (mosses and liverworts), although some of these lower plants develop organs, *rhizoids*, which perform some of the functions of roots. In phylogeny the root is associated with the evolution of the sporophytic generation in the higher plants and with the development of the land habit. They occur in Pteridophytes (ferns and their allies) and Spermatophytes (seed plants). The primary function of the root is absorption of water and inorganic salts in solution and the conduction of these to the stem, but it also affords anchorage and support and frequently serves for storage of reserve foods. In some instances it may function in vegetative reproduction and in special cases (some aerial and aquatic roots) may carry on photosynthesis. The root usually develops *root-hairs*, slender unicellular outgrowths formed by the lateral extension of cells of the outer layer, *epidermis*. These serve to increase the absorbing surface of the root and bring it into intimate relationship with the soil particles. The older root hairs generally die; rarely some are persistent, so that the active zone of root-hairs usually lies just back of the apex of the root.

When the seed germinates, the *primary root* or *radicle* is the first organ to appear. It grows downward through the soil, anchoring the seedling and establishing contact with the soil. Secondary roots, which often repeat the form and structure of the main root, are developed in regular succession from above downwards (acrosteal), and owing to the fact that they originate in a definite position in the interior of the root (generally opposite the xylem masses) they develop in longitudinal rows and have to break through the overlying tissue of the parent root. True forking of the root (dichotomy) occurs in the Lycopodiaceae (the shoots of which also branch dichotomously), but not in the higher plants.

FROM STRASSBURGER'S "FLEISCHUCH DER WURZEL" (GUSTAV FISCHER).
FIG. 2. — FLESHY ROOTS OF DAHLIA VARIABILIS

Roots which originate elsewhere than as acropetal outgrowths of a main root are known as *adventitious*, and may arise on any part of a plant. They are especially numerous on underground stems, such as the under side of rhizomes, and also develop from stems under favourable conditions, such as moisture and absence of light; a young shoot or a cutting placed in moist soil may quickly form adventitious roots.

The potentiality of many plants to develop adventitious roots from stems is widely used in horticulture and floriculture as a means of vegetative propagation. This insures the production of

plants that resemble the parent stock and avoids the possibility of undesirable variation that may result from propagation by means of seed. It is also a rapid method of propagation in the case of slow-growing woody plants. Adventitious roots may also arise from leaves under similar conditions, as, for instance, from begonia leaves when planted in soil.

The forms of roots depend on their shape and mode of branching. When the central axis goes deep into the ground in a tapering manner without dividing, a *tubroot* is produced. This kind of root is sometimes short, and becomes swollen by storage of foodstuffs, as in the *conical* root of carrot, or the *fusiform* or spindle-shaped root of radish, or the *napiiform* root of turnip. In some forest trees the first root protruded continues to elongate and forms a long primary root-axis, whence secondary axes arise. In many plants, especially monocotyledons, the primary axis soon dies and the secondary axes take its place. When the descending axis is very short, and at once divides into thin, nearly equal fibrils, the root is called *fibrous*, as in many grasses; when the fibrils are thick and succulent, the root is *fasciculated*, as in the sweet potato, dahlia, *Ranunculus ficaria*, and *Oenanthe crocata*. Some so-called roots are formed of a stem and root combined as in *Orchis*, where the tuber consists of a fleshy swollen root bearing at the apex a stem bud. As in the stem, growth in length occurs only for a short distance behind the apex, but in long lived roots increase in diameter occurs continually in a similar manner to growth in thickness in the stem.

Roots are usually underground and may be white or variously coloured as in the beet or carrot. In some cases where they arise from the stem they pass for some distance through the air before reaching the soil. Such roots are called *aerial*. They are well seen in maize (*Zea*), the screw-pine (*Pandanus*), the Banyan (*Ficus indica*), and many other species of *Ficus*, where they eventually assist in supporting the stem and branches. In the mangrove they often form the entire support of the stem, which has decayed at its lower part. In tree-ferns they form a dense coating around, and completely conceal the stem; such is also the case in some *Dracaenas* and palms. In *epiphytes*, or plants growing in the air, attached to the trunks of trees, such as orchids of warm climates, the aerial roots produced do not reach the soil; they continue always aerial and greenish, and they possess stomata. Delicate hairs are often seen on these epiphytic roots, as well as a peculiar spongy investment formed by the cells of the epidermis which have lost their succulent contents and are filled with air. This layer is called the *velamen*, and serves to absorb the moisture contained in the air, on which the plant is partially dependent for its water supply. Some leafless epiphytic orchids, such as species of *Angreecum*, depend entirely upon their aerial roots for nourishment; these perform the functions both of leaves and roots. A respiratory or aerating function is performed by roots of certain mangroves (*g.u.*), growing in swampy soil or water and sending vertical roots up into the air which are provided with aerating passages.

Parasitic plants, as the mistletoe (*Viscum*), broomrape (*Orobancha*), dodder (*Cuscuta*) and *Rafflesia*, send rootlike processes into the substance of the plants whence they derive nourishment. Leaf-buds are sometimes formed on roots, as in plum, cherry and other fruit trees. In the coral-root orchid, *Corallorhiza*, a stem structure, the shortly branched underground rhizome, performs all the functions of a true root, which is absent. In some aquatic plants the root acts merely as a holdfast, or it may be flattened and contain chloroplasts for the manufacture of food; in others it is altogether absent as in *Salvinia* and *Utricularia*. The well-known epiphyte *Tillandsia usneoides* (Spanish moss) is rootless.

ROOT. Arab writers of the 9th century spoke of one of the equal factors of a number as a root, and their mediaeval translators used the Latin *radix* (root) for the same concept. The adjective is radical.

If a is a positive real number and n is a positive integer, there exists a unique positive real number x such that $x^n = a$. This number is called the (principal) n th root of a , and is written $\sqrt[n]{a}$. The integer n is called the index of the root. For $n=2$, the root is called the square root and is written \sqrt{a} . The root $\sqrt[n]{a}$ is called the cube root of a . If a is negative and n is odd, the unique negative n th root of a is termed principal.

The practical determination of square and higher roots of positive numbers is discussed in the article on ARITHMETIC.

FIG. 3.—FLESHY ROOT OF ORCHIS

If a rational integer (whole number) has a rational n th root, i.e., one which can be written as a common fraction, then this root must be an integer. Thus 5 has no rational square root since $2^2 < 5$ while $3^2 > 5$.

There are exactly n complex numbers which satisfy the equation $x^n = 1$, called the complex n th roots of unity. If a regular polygon of n sides is inscribed in a unit circle with centre at the origin so that one vertex lies on the positive half of the x -axis, the radii to the vertices are the vectors representing the n complex n th roots of unity. If the root whose vector makes the smallest positive angle with the positive direction of the x -axis is denoted by ω , then $\omega, \omega^2, \omega^3, \dots, \omega^{n-1}$ constitute all of the n th roots of unity. Thus $\omega = -\frac{1}{2} + \frac{1}{2}\sqrt{-3}$, $\omega^2 = -\frac{1}{2} - \frac{1}{2}\sqrt{-3}$, $\omega^3 = 1$ are the cube roots of unity.

Any root ϵ which has the property that $\epsilon, \epsilon^2, \dots, \epsilon^{n-1} = 1$ give all of the n th roots of unity is called primitive.

Evidently the problem of finding the n th roots of unity is equivalent to the problem of inscribing a regular polygon of n sides in a circle. For every integer n , the n th roots of unity can be determined in terms of the rational numbers by means of rational operations and radicals; but they can be constructed by ruler and compasses (i.e., determined in terms of the rational operations and square roots) only if n is a product of distinct prime numbers of the form $2^k + 1$, or 2^k times such a product, or is of the form 2^k .

If a is a complex number not 0, the equation $x^n = a$ has exactly n roots. (See COMPLEX NUMBERS.) All of the n th roots of a are the products of any one of these roots by the n th roots of unity.

The term root has been carried over from the equation $x^n = a$ to all polynomial equations. Thus a solution of the equation

$$f(x) = a_0x^n + a_1x^{n-1} + \dots + a_{n-1}x + a_n = 0, \quad a_0 \neq 0$$

is called a root of the equation. If the coefficients lie in the complex field, an equation of the n th degree has exactly n not necessarily distinct complex roots. If the coefficients are real and n is odd, there is a real root. But an equation does not always have a root in its coefficient field. Thus $x^2 - 5 = 0$ has no rational root.

If $f(x) = 0$ is an equation with coefficients in a field F , there exists a unique field F^* obtained by adjoining to F all of the roots of $f(x) = 0$. This field is called the root field of $f(x) = 0$. In F^* the polynomial $f(x)$ can be factored into linear factors. (See EQUATIONS, THEORY OF.)

A rigorous proof of the existence of the root field F^* can be made along the following lines. Let $f(x)$ be a factor of $f(x)$ which is irreducible in F . The set of all polynomials in x with coefficients in F , taken modulo $f(x)$, constitute a field F' containing F in which $f(x)$ has a linear factor. A continuation of this process leads to the root field F^* . (C. C. M.)

Dickson, *History of the Theory of Numbers* (1919–23); on the algebraic theory, G. Chrystal, *Algebra*, and ed. (Edinburgh, 1889); on the history of terms and methods, D. E. Smith, *History of Mathematics*, especially vol. 2 (1923–25).

ROOT CROPS. Many kinds of roots are cultivated for human use, some such as carrots, parsnips, etc., being grown extensively on a commercial scale. But what are commonly termed root crops are those which are grown on farms in rotation with other field crops (see ROTATION OF CROPS; also BEET; MANGEL; TURNIP). In a broad sense, however, all roots grown for human food are called root crops, as are many grown for other useful purposes. The root crops most commonly produced for human food include the beet, carrot, onion, parsnip, potato, radish, sugar beet, sweet potato and turnip. Representative minor root crops are the chufa (*Cyperus esculentus*), cultivated by the Negroes of the southern U.S., and the so-called tule-potato (tubers of *Sagittaria latifolia*), cultivated by the Chinese in central California.

Many roots grown for other economic purposes assume local importance as crops, as the liquorice, which is grown in southern Europe.

ROOT CUTTER; see PROCESSING MACHINERY.

ROOZEBOOM, HENDRIK WILLEM BAKHUIS (1854-1907), Dutch physical chemist, was born on Oct. 24, 1854; he was at first (1878) assistant in the Chemistry institute at Leyden, then lecturer (1890), and finally (1896) professor of inorganic and physical chemistry at Amsterdam. He died on Feb. 8, 1907. Roozeboom is best known for the introduction into chemistry of the "phase rule" (see CHEMISTRY: Physical), which had been deduced previously by J. Willard Gibbs on thermodynamical grounds. With his students he made a large number of investigations of melting points and solubilities in studying the equilibria between solid and liquid phases in various systems. He started in 1904 to publish a compilation under the title of *Die heterogene Gleichgewichte vom Standpunkt der Phasenlehre*, which was completed in 1918, after his death, by his pupils.

ROPE AND ROPEMAKING. Rope is made of animal or vegetable fibres and of metallic wires. Fibre rope alone will be considered here. (See WIRE ROPE.) "Cordage" is a term applied generally to yarns, twines, ropes and cables but refers specifically to "rope" in the industry.

Fibre rope is cordage of "stranded" construction, i.e., fibres or hairs laid parallel and twisted together making a yarn; two or more of these yarns twisted together "forming" the strand and three or more of these strands twisted together "laying" the rope. Three or more ropes laid together make a "cable-laid" rope, sometimes referred to colloquially as "hawser-laid." The smallest fibre ropes made are approximately $\frac{1}{8}$ in. in circumference or $\frac{1}{16}$ in. in diameter so that any similar products of less than these dimensions are not rope in the usual acceptance of the term.

Two or more yarns twisted together, either plain twisted or laid, are twine regardless of the form of put-up; laid twine is sometimes referred to as "corded." Single yarns are known as yarns except binder twine, which is a single yarn product. This group of products is known as "ply and yarn goods" in the hard fibre cordage industry and as yarns, twines or cords in the soft fibre industry. Braided construction of yarns, such as ass. cords, is sometimes referred to as "rope." (X.)

Early History of Rope-making.—Rope is already represented in use in southwest Asia (Elam) in the chalcolithic period (4th millennium B.C., v. Lasso), but this was probably made of plaited thongs, a type which has persisted down to modern times, especially in arrested cultures, e.g., among the Rodies of Ceylon, a retarded, outcast group. But probably almost, if not quite, as ancient is that of bark fibre, represented in more evolved forms by the coir types of southeast Asia, where one kind is still made in the very primitive technique of rolling the fibres together with the palm of the hand on the bare thigh, e.g., among the Nayadis of Malabar, the nucleus of whose culture remains epipalaeolithic in character. The thong-plaiting is the simplest and quite likely the first stage of plaiting out of which grew, before the end of the palaeolithic period, mat- and basketmaking, which in turn engendered, in the neolithic, true weaving. The primitive coir-rope-making method, on the other hand, is the most rudimentary, and almost certainly the initial way of spinning, still used, e.g., well down into historical times in Egypt. Thus rope-making is the technical ancestor of both the two fundamental textile processes.

Cord (the primary element of rope, and incorporating its essential principle) must have been used very early, probably in the upper palaeolithic period at least, to attach tools to handles; and the same need for rope implies its common currency in the 4th millennium, when numerous bone handles are sometimes found with the blade or point missing (E. Schmidt, *Tepe Hisar*, Phil., 1937, p. 59). In the middle of the 3rd millennium B.C., patterns impressed with spun cords are the definitive feature of a south-eastern European pottery; and by the middle of the 2nd millennium heavy rope must have been a commonplace in the east Mediterranean, given the development there of shipping and hence ships, which even when propelled by oars require rope equipment. Moreover, at about this same time a number of

terms for "rope" are found in Akkadian, e.g., though they are not yet more specifically translatable, while actual examples of papyrus rope of about this period have been found in Egyptian tombs. Late in the millennium heavy cables are reproduced in bronze as handles of vessels in China, whither the technique had probably been conveyed by the bronze casters, most likely from the eastern Asia Minor-Adharbayan region, and heavy cable mouldings appear about the same time on pottery from Luristan whose bronze art can be traced to the same source.

When Xerxes (480 B.C.) built the bridge of boats across the Hellespont "the Phoenicians constructed one line with cables of white flax, the Egyptians in the other used ropes made of papyrus (Herod., Hist., vii, 34). In India in the 4th century B.C., rope-making was so specialized that one class of experts made ropes just for horses, another for elephants (*Arthashastra*); and in China, in the Han period if not earlier, the emperor's carriage in time of mourning was equipped with silk ropes (*Li Ki*, Bk. iii, sect. iii). The craft was carried, along with various textile and other techniques such as pottery making and metallurgy, into the early American cultures. (P. AN.)

Rope-making had been going on for centuries with little change up to the time of the introduction of machinery about the middle of the 19th century. In the early days all the yarn was spun by hand. The hemp was first hackled by combing it straight over a board studded with sharp steel teeth. A bunch or "head" of this hackled hemp was placed around the spinner's waist, who attached a few fibres to a hook on the spinning wheel and, as the hook was revolved by means of a large wheel turned by hand, walked backwards away from the wheel feeding the fibre from the supply around his waist, preserving the uniformity and proper size of the yarn. Several yarns were twisted together by use of a hand wheel and several hooks, forming the "strand" and three or more strands twisted together "laying" the rope. Horsepower was used in old times for forming and laying rope which was too large to be made by hand. The term "ropewalk" came from the long low buildings used and the walking back and forth of the spinners and ropemakers. In the early days every community of any size had its ropewalk, there being 173 in the United States in the year 1810. These walks were often 900 ft. or more in length. Many were in the open air.

The crude methods of rope-making of centuries ago are still used in many parts of the world today. Improved ropewalk methods are used extensively today for making extra large ropes and all but the smaller sizes of tarred hemp ropes; it is also an economical and quick method of making ropes to special order for immediate delivery.

Raw Materials.—In the United States and European countries soft fibres, principally hemp (coming mostly from Russia, Italy and the United States) and flax were used for rope until the second quarter of the 19th century. Hemp is still used for tarred hemp rope and fittings for marine purposes. Abaca commonly referred to as Manila fibre, because it is grown almost exclusively in the Philippine Islands and exported principally from the port of Manila, has established itself as the best material for rope-making where strength and durability are the prime requirements. Henequen, sometimes misnamed sisal, is next in importance as a rope fibre, and comes from Yucatan, Mexico and Cuba. Sisals are important rope fibres and come principally from Java, Africa and the Bahamas. Other fibres used are New Zealand, Mauritius, Magway and Isle fibres. Jute and cotton are used to a limited extent in the manufacture of ropes of stranded construction. Cotton is used to a greater extent in the manufacture of braided cords.

Present Manufacturing Processes.—The primary object of twisting fibres together in a rope is that, by mutual friction, they may be held together when a strain is applied to the whole. Hard twisting has the further advantage of compacting the fibres and preventing, to some extent, the penetration of moisture when the ropes are exposed to water; but the yield of rope from a given length of yarn diminishes in proportion to the increase of twist.

The rope-making process is essentially the same, no matter what kind of fibre is used. The process divides itself into five

BY COURTESY OF THE COLUMBIAN ROPE CO.

PROCESSES THROUGH WHICH FIBRE PASSES IN THE MANUFACTURE OF ROPE: (A) FIBRE FROM BALES WITH TANGLES SHAKEN OUT; (B) THE BREAKER WHERE THE FIBRE IS COMBED; (C) SLIVER (FIBRE AFTER IT IS COMBED) COMPRESSED INTO COMPACT FORM; (D) FIBRE TWISTED INTO YARN; (E) YARN DRAWN THROUGH A GUIDE AND TWISTED INTO A READY OR STRAND; (F) STRANDS LAID UP INTO ROPE; (G) FINISHED ROPE COILED AND READY FOR SHIPPING

operations. First, selection of fibre, second, preparing the sliver; third, spinning the yarn; fourth, forming the strands; fifth, laying the strands into rope. With cable-laid ropes there is another operation, laying the strands of the cable, which are in fact completed ropes, into the finished cable.

At the start of the manufacturing process the bales of fibre are opened and heads of fibre shaken out. The fibre is put through several processes of combing and straightening. These operations are, in general, all of the same kind. The fibre is slowly carried along on a series of bars connected by endless chains, the bars being studded with sharp steel pins, like combs, that stand upright as the fibre passes along with them. A similar set of combs, moving very much faster, pulls the fibre rapidly away from the first set, combing it out at the same time. Fine jets of lubricant are sprayed on the fibre as it enters the first machine.

The fibre is delivered from the machine in a heavy, continuous stream or sliver which is coiled by hand or machine into a receptacle, or on the floor. Several of these slivers are then fed into a similar machine, and the kinks and unevenness further removed by a repetition of the same process. This preparation or combing is repeated from 8 to 12 times on five different machines, each operation combing the fibre and producing a smaller and more even sliver, until finally it comes out of the finisher in a continuous stream as water flows from a hose. The thoroughness with which these operations are carried out—the care taken in preparing the fibre—is largely responsible for the uniformity and excellence of the finished product.

In the preparation of the sliver, the object has been merely to eliminate all sorts of dirt and foreign matter and to lay these fine, threadlike strands parallel with one another so that they can be more easily spun together. As the sliver enters the spinning machine it is taken from the rollers by another series of fine combs. From the combs it passes through a funnel-shaped tube and is then wound about a little capstan. It is between the tube and the capstan that the yarn comes into being. The friction on the revolving capstans draws the yarn through the machine. From the capstans it is automatically wound on a large spool about 12 in. long, named a bobbin. The capstans and the bobbin whirl very fast, and the combination of this whirling motion and the drawing forward of the revolving capstans, spins the heretofore parallel fibres into what is known as a yarn. For different sizes of yarn and for yarns designed for various purposes, a varying number of twists per foot are imparted to the yarn. This yarn is the first merchantable product of the cordage mill and may be sold in this original form or used as the basis of other cordage products.

A rope is usually formed of three or four strands, each strand composed of a number of yarns laid parallel and slightly twisted together. Making these strands is "forming." As the strand is twisted it is wound on a large reel and appears as a smooth, round strand composed of a number of individual yarns. This is known as the "ready." The yarn has a tendency to untwist; to overcome this the twist of the ready or strand is made in the opposite direction. The result is that the tendency of the yarn to untwist in one direction, and the tendency of the ready to untwist in the other direction balance

each other

The ropemaking operation is "laying." In laying the rope, three or four of the reels containing the readies or strands are put on the laying machine, and the strands are led through a "block," wound around the capstan, and reeled on the finishing end of the laying machine. In laying there is a different twisting problem, for the ready is neutral—that is, it has no tendency to untwist—and if the readies were twisted together without altering this neutral condition the rope would continually untwist. So an extra twist is added to the ready as it is passed into the machine, this twist being computed so that it will be just sufficient to counteract the tendency of the three strands to untwist when they are formed into a rope. All good rope is absolutely neutral; if cut in 5-ft. to 10-ft. lengths and laid on the ground, it will not untwist of its own accord.

Cable-laid rope consists of three completed ropes, nine of the simple strands which form an ordinary rope. The same method of balancing the twisting strands is used, an additional twist or fortwist being given to the three strands before they are laid up, so that their

Uses and Care of Rope.

Rope is made of many different materials, but the most common is of cotton. It is made of high-grade raw material, selected with a thorough knowledge of what the rope is to do. It must be so made that every strand will be of even tension. It must be properly treated with a lubricant which will at once preserve and lubricate. There are three general sources of damage which will shorten the life of rope: first, mechanical injury, such as bending over too sharp a pulley; second, damage from chemicals, such as acids; and third, damage from climatic or other conditions of storage, such as moisture or dry rot. It should be stored in a cool dry place with air circulation. (J. S. McD.)

In addition to the heavy rope there are many varieties of cord and twine made by means of the preparing, spinning and doubling machines. The fishing industry takes many different types for lines and nets, while the variety of cord and twine for other industrial and for household purposes is almost unlimited. All yarn from long vegetable fibre is more or less rough as it leaves the spinning frame, even after two or more threads have been twisted together. It is therefore necessary, for many uses, to impart a polish to the cord or twine. Special machines are used for this purpose. Bobbins of yarn, equal to the number required, and depending upon the capacity of the machine, are placed in a bank or creel, and the ends are collected and passed under a roller which is immersed in hot starch. The yarns become saturated with this starch, but, as they emerge from the starch-box, the superfluous starch is removed by passing the yarns between two rollers. The yarns now pass over a series of drying cylinders and polishing rollers, and are finally rewound by the same machine on to other bobbins. This machine is termed a bobbin-to-bobbin polishing machine. In some cases the hot drying cylinders are replaced by a system of hot-air drying. The finished yarns are now made up by machinery into hanks, balls or cheeses, according to which happens to be the best state for future use and for transport.

Driving Ropes.—It has already been stated that cotton driving ropes are extensively applied in the transmission of motive power. Although the mechanical efficiency of transmission by ropes is less than that obtained by wheel gearing, rope driving has several compensating advantages:—

1. It is practically noiseless.
2. It occupies less space than belt driving, and the slip is not so great.

3. The turning movement is better; machines therefore run more steadily and production is increased.

4. Shafts may be run at higher speeds.

5. Greater range of drives; anything from 10 ft. to over 80 ft., and much greater distances when carrier pulleys are used.

6. The drive is usually obtained by a number of ropes; if one should break, the rope may be removed and the machinery run in most cases, until stopping time.

The number of ropes to be used depends upon the power to be transmitted; upon the sectional area of the ropes, and upon the surface speed of the driving pulley. The speed of the rope may vary from 2,000 ft. to 6,000 ft. or over per minute. In some few exceptional cases 60 ropes have been used on one pulley; the number usually varies between 15 and 40. (See *Powys Transmissions: Mechanical*.)

The foregoing refers exclusively to ropes made from fibrous yarns; metallic ropes appear under the heading *Wire Ropes*.

See T. Woodhouse and P. Kilgour, *Cordage and Cordage Hemp and Fibres* (1919); Robert Chapman, *A Treatise on Rope-making* (1868); H. R. Carter, *Modern Flax, Hemp and Jute Spinning and Twisting* (1925); P. J. Stopford, *Cordage and Cables* (1925); "U.S. Government Master Specifications for Rope Cotton," *Bureau of Standards Cir. 326*, (1927).

ROPE MOULDING, in architecture and the decorative arts, a convex half or quarter round moulding, spirally channelled, so that it resembles a rope; also called cable moulding (*q.v.*).

ROPE, JOHN CODMAN (1836-1899), American military historian and lawyer, was born at St. Petersburg on April 28, 1836. He graduated at Harvard in 1857, was admitted to the bar in 1861 and became a successful lawyer. He founded in 1876 the Military Historical Society of Massachusetts for the collection and discussion of evidence relating to the Civil War. To it he presented his military library and his collection of prints and medals. He died at Boston on Oct. 28, 1899. His principal work is an unfinished *Story of the Civil War*, to which he devoted most of his later years; this covers the years 1861-62 (1894-98). It was completed in five volumes in 1913 by W. R. Livermore. *The Army under Pope* (in "Campaigns of the Civil War," vol. iv., 1881) is a detailed narration of the Virginia campaign of Aug.-Sept., 1862, which played a great part in reversing contemporary judgment on the events of those operations, notably the condemnation of Gen. Fitz John Porter's conduct. His *Campaign of Waterloo* (1892) is a standard work.

ROPE-WALKING, the art of walking, dancing and performing tricks on a rope or wire stretched between two supports.

ROPEWAYS AND CABLEWAYS. The aerial ropeway is essentially an intermittent handling device and may be defined as that method of handling materials which consist of drawing receptacles—such as buckets or skips—suspended from ropes and by means of ropes, from place to place, such receptacles being manually or automatically filled and discharged. There is no limit to the length of a ropeway installation, since it may consist of any number of units, while the length of a single unit may be as much as 4½ miles.

Historical.—At what period of history ropeways were first used it is impossible to say, but the fact that ropes and pulley blocks—which are the essential parts of a ropeway—were known to the ancients, seems to render a pedigree of at least 2,000 years possible. An old engraving shows a ropeway in use in the City of Danzig in 1644. This was the work of Adam Wybe, a Dutch engineer, and is a single ropeway in its simplest form, consisting of an endless rope passing over pulleys suspended on posts; to the rope were attached a number of small buckets which carried earth from a hill outside the city to the rampart inside the moat. The rope was probably of hemp.

In modern ropeways wire ropes are exclusively used, which date back from about 1860, when a ropeway was erected in the Harz mountains. Since then several systems have been evolved, but space does not permit of entering into details of all the possible applications of a ropeway; it must suffice, therefore, to mention the two principal types, which are known as single and double ropeways. In the former, one endless travelling rope both supports and conveys the load, while in the latter the load carriers are supported by a stationary rail rope on which they are hauled along by an independent endless hauling rope. The systems are also termed, respectively, mono-cableway and bi-cableway, but since a cableway is generally understood to be a different type

of aerial transport altogether the names single and double ropeway are preferable.

Such aerial transport resembles in substance vehicular rail transport; in this case, however, the rolling stock is suspended from a rope which serves as a rail, instead of running on the permanent way of a light railway. It is obvious that a single overhead rope as a track, has enormous advantages over a pair of rails laid on the ground, as in the orthodox rail-track with its sleepers, the cost of preparation of the ground has to be considered, which may involve the construction of embankments, bridges, etc. When building a ropeway the overhead rope should run in a bee-line from place to place—say from an undeveloped area to the nearest available point where main transport is available, whereas in the case of a light railway, owing to limitations of grade, usually about 3%, the permanent way has to traverse a tortuous route, three or four times as long possibly, as the bee-line of the rope-track, which, moreover, may be negotiated with safety on a grade of 40%. For example, a ropeway may be cited, which has a total length of 5,400 ft. with a total difference in altitude of 2,000 ft., the ground which it covers could not have been negotiated by a rail track of less than 15 m. in length, graded at 1 in 42. It is essential to take as straight a line as possible when laying out a ropeway because curves generally necessitate angle-stations, which entail expenditure of more capital and increase in working cost. On the other hand, ground that would be difficult for the railway engineer, such as steep hills, deep valleys and turbulent streams, has no terrors for the ropeway erector.

The Single Ropeway.—The single ropeway consists essentially of an endless running rope from which the carriers are suspended and with which they move in the following way:—The receptacles are fitted with simple curved hangers pivoted from a Λ -shaped saddle, which holds sufficiently tight by frictional contact to the rope and therefore travels with the same. The suspended frame of the load carrier is also fitted by the side of the Λ -shaped saddle with the small grooved pulley which engages at the terminals with shunt rails and thus disengages itself from the running rope; the frame of the load carrier becomes stationary on these shunt rails for filling or emptying, after which it is pushed on to the returning rope again. Or the carriers may be permanently fixed to this rope and move with it. The ropeway itself consists of an endless rope running between two terminal drums, one of 6 to 10 ft. diameter, known as the driving drum, being provided with power receiving and transmitting gear, while the drum at the opposite terminal is fitted with tightening gear. The endless rope is supported on suitable pulleys which are, in turn, supported on standards or trestles spaced at intervals, varying with the nature of the ground. The rope runs at an average speed of 4 m. per hour, at which speed the bucket or skip can be arranged to load and unload itself automatically. Generally speaking, the single ropeway is not so suitable for heavy loads and long distances as the double. The work of Ropeways Ltd. favours the single-rope system. The founder of that firm, J. Pearce Roe, introduced multiple sheaves for supporting the rope at each standard. The maximum load carried on such a ropeway is 150 tons per hour. Another installation on the same system serves an iron mine in Spain and spans 6,000 yd. of very rough country so steep that in many places even the sure-footed mule cannot keep on the track. This ropeway can deal with 85 tons per hour. The greatest distance covered on any one section of the single ropeway is 7,100 yd., or about 4 miles. The Dorada ropeway which is the longest in the world—47 m. in length—is built on the single-rope system. It has 15 units and a capacity of 20 tons per hour. In addition to the conveyance of merchandise, principally coffee, it is also occasionally used for passenger traffic.

The Double Ropeway.—This consists, as already stated, of an independent rail rope and a separate continuous hauling rope disposed parallel to one another. The carrier runs on the stationary rope which is fitted with running heads having grooved steel wheels. The load is borne by a hanger pivoted from the carrier and conveyed along the rail rope by the endless hauling rope at an average speed of 4 to 6 m. per hour. A great variety of clips have been introduced for the purpose of coupling the

carriers to the hauling rope, but these are automatically connected and disconnected at the shunt rails of the terminals. The hauling is operated by driving gear at one end and controlled at the other by tightening gear, just as in the single rope system. The rail ropes of a double ropeway are sectionalized every 2 or 3 m., whilst the longest section for a hauling rope is about 9 miles. Such ropeways will support single loads of 6 cwt. to a ton or more.

Motive Power.—The power required for a ropeway will vary according to conditions but is relatively moderate. If the aggregate down gradients exceed the up gradients the power consumption may be nil or the ropeway may even produce power which may be harnessed to drive other machines; or it may have to be absorbed by some form of brake device. In a Japanese ropeway 1,800 yd. in length, which runs mostly at an incline of 1 in 12, the force generated is absorbed by a hydraulic brake, the revolving fan of which drives the water against fixed vanes which repel and heat it. In this way 50 h.p. is absorbed and the speed brought under the control of a hand brake.

The initial outlay for a ropeway is usually moderate, though of course it varies according to topographical conditions.

Ropeways are largely independent of weather conditions and their working need not be interrupted even by heavy snowfalls. Their construction is very simple and there is little to get out of order. Sound workmanship and good material will ensure a relatively long life. The ground space occupied by ropeway installations, beyond that occupied by the terminals is exceedingly small and is confined to the emplacements of the standards which, in modern ropeways are few and far between.

Aerial Cableways.—The aerial cableway is a development of the ropeway and is a conveyor capable of hoisting and dumping at any desired point. The load is carried along a track consisting of a single span of suspended cable which covers a comparatively short distance as rope haulage goes. The trackway may either run in a more or less horizontal direction, i.e., the terminals may be on the same level, or it may be inclined at such an angle that the load will descend by gravity. The trackway or rail rope rests upon saddles of hard wood or iron on the tops of terminal supports usually known as towers, which may likewise be constructed of wood or iron, and if the exigencies of the work render it desirable they can be mounted on trolleys and rails, in which case the cableway is rendered portable and can be moved about, which is sometimes a great advantage in connection with dock and harbour work. The motive power may be either steam, gas, or electricity. The motor is situated in what is termed the head tower, which is occasionally a little higher than the tail tower. The span between the two towers sometimes extends to 2,000 ft., but this is exceptional. Objects weighing as much as 8 tons are handled by such devices. The load, which may be carried in a skip or tray, is borne by an apparatus called the carrier, which is a modification of a running head, consisting of pulleys and blocks and running along the main cable or trackway. This carrier is also fitted with pulleys or guides for the dump line, and is drawn along the main cable by an endless hauling rope which passes from the carrier over the head tower and is wound several times around the drum of the winding engine to secure frictional hold, then back over the head tower to the tail tower, returning to the rear end of the carrier. The hoisting rope passes from the engine to the fall-block for raising the load. The dump line comes from the other side of the winding engine drum and passes to a smaller block attached to the rear end of the skip or tray. The whole weight of the skip is borne by the hoisting rope, while the dump line comes in slack but at the same rate of speed. Whenever it is desired to dump the load the dump line is shifted to a section of the drum having a slightly larger diameter, and being thus drawn in at a higher rate of speed the load is discharged. The engine is then reversed and the carriage brought back for the next load.

This is, in outline, the mode of operating all cableways. These appliances have rendered great service as labour-savers in navvying, mining and quarrying work; for instance in placer-mining cableways have been found very useful when fitted with a self-filling drag-bucket which will take the place of a great number of

hands. Cableways can be worked at a great speed; a good mean speed, however, would be 500 to 750 ft. per min. for conveying, and 200 to 300 ft. per min. for hoisting. See also TELPHERAGE. **Bibliography.**—G. F. Zimmer, *Mechanical Handling and Storing of Material* (1916); H. Blyth, *Modern Telpherage and Ropeways* (1926) (G. F. Z.).

ROPS, FÉLICIEN (1833–1898), Belgian painter, designer and engraver, was born at Namur, in Belgium, on July 7, 1833; he spent his childhood in that town, and afterwards in Brussels, where he composed in 1856, for his friends at the university, the *Almanach Crocodilien*, his first piece of work. He also brought out two *Salons Illustrés*, and collaborated on the *Crocodile*, a magazine produced by the students. The humour shown in his contributions attracted the attention of publishers. He designed, among other things, frontispieces for Poulet-Lafassie, and afterwards for Gay and Doucé. In 1859–60 he contributed some of his finest lithographs to a satirical journal in Brussels called *Uylen-spiegel*. About 1862 he went to Paris and worked at Jacquemart's. He subsequently returned to Brussels, where he founded the short-lived International Society of Etchers. In 1865 he brought out his famous "Buveuse d'Absinthe," which placed him in the foremost rank of Belgian engravers; and in 1871 the "Dame au Pantin." After 1874 Rops resided in Paris. His talent was stimulated by travels in Hungary, Holland and Norway. He executed 600 original engravings enumerated in Ramiro's *Catalogue of Rops' Engraved Work* (Paris, Conquet, 1887), and 180 from lithographs (Ramiro's *Catalogue of Rops' Lithographs*, Paris, Conquet, 1891), besides a large number of oil-paintings in the manner of Courbet, and of pencil or pen-and-ink drawings, several very remarkable water-colour pictures, among which are "Le Scandale," 1876; "Une Attraction," 1877 (now in the Brussels Museum); a "Tentation de St. Antoine," 1878; and "Pornocrates," 1878. From 1880 to 1890 Rops devoted himself principally to illustrating books: *Les Rimes de joie*, by Théophile Gautier; *Le Vice suprême et Curieuse*, by J. Peladan; and *Les Diaboliques*, by Barbey d'Aurevilly; *L'Amante du Christ*, by R. Darzens; and *Zadig*, by Voltaire; and the poems of Stéphane Mallarmé have frontispieces due to his fertile and powerful imagination. Before this he had illustrated the *Légendes Flamandes*, by Ch. de Coster; *Jeanne France*, by Th. Gautier; and brought out a volume of *Cent Croquis pour réjouir les Hommes Gens*. His last piece of work, an advertisement of an exhibition, was done in November 1896. Rops died on Aug. 23, 1898, at Essonne, Seine-et-Oise, on his estate, where he lived in complete retirement with his family. Rops joined the Art Society of the "XX," formed at Brussels in 1884, as their revolutionary views were in harmony with the independence of his spirit. After his death, in 1899, the *Libre Esthétique*, which in 1894 had succeeded the "XX," arranged a retrospective exhibition, which included about fifty paintings and drawings by Rops. His engraved work is the most important, both as to mastery of technique and originality of ideas. Hardly any artist of the 19th century equalled him in the use of the dry-point and soft varnish.

In 1896 *La Plume* (Paris) devoted a special number to this artist, fully illustrated. E. Deman, Brussels, brought out a volume in 1897 entitled *Félicien Rops et son œuvre*—papers by various writers. We may also mention a study of *Félicien Rops*, by Eugène Demolder (Paris, 1894), and another by the same writer in *Trois Contemporains* (1901); *Les Ropsiques*, by Pierre Gaurme (London, 1898), and the notice by T. K. Huysmans in this volume called *Certaines*. See also E. Romero, *Félicien Rops* (1905).

RORIDULA, a genus of the Drosereaceae, of which there are two species peculiar to the mountains of South Africa. In both species the leaves are armed with numerous stalked glands, resembling closely but superficially the tentacles of *Drosera* (see *SUNDEW*) and secreting a sticky material which catches insects. These characters led to the belief that the plants are carnivorous. It was, however, shown that the secretion is not mucilaginous but resinous, which at once excludes the possibility of carnivory, since enzymes work in a watery medium. Moreover, the tentacular glands in *Roridula* are of entirely different structure from that in *Drosera*, having resin glands opening by ducts at the apex of the gland. R. Marloth, having in earlier years regarded *Rori-*

dula as carnivorous, later took the opposite view. He pointed out that the secretion contains a caoutchouc, and this was later confirmed to the extent that the substance is at least caoutchouc-like. Marloth pointed out also that branches of the plants, which are both shrubby, can be used as fly-paper, as *Drosophyllum* is said to have been used in Portugal. See R. Marloth, "Some Recent Observations on the Biology of Roridula," *Annals of Botany*, vol. 17, p. 151 (1903); F. E. Lloyd, "Is Roridula a Carnivorous Plant?" *Canadian Journal of Research*, vol. 10, p. 557 (1934). (F. E. L.)

RORQUAL, a name for a species of *Balaenoptera*, large whales of elongated shape, with a small back fin and longitudinal folds on the throat (see CETACEA). The flippers are small, the head small and flat, the whalebone coarse and short, the tail much compressed. There are probably four species. Sibbald's rorqual or blue whale (*Sibbaldus musculus*) is the largest of all animals, reaching lengths of over 100 ft. The common rorqual (*Balaenoptera physalus*) is some 20 ft. shorter, slate colour above and white beneath. (For illustration see CETACEA.)

RORSCHACH, a busy commercial town in the Swiss canton of St. Gall, situated on the south-west shore of the Lake of Constance, and by rail 62 mi. N.E. of Zurich. In 1941 its population was 10,536, mostly German-speaking. From 1408 to 1798 it belonged to the abbey of St. Gall, and then to the canton Sântis (named canton of St. Gall in 1803) of the Helvetic republic.

ROS, SIR RICHARD (b. 1429), English poet, son of Sir Thomas Ros, lord of Hamlake (Helmsey) in Yorkshire and of Belvoir in Leicestershire, was born on March 8, 1429. In Harl. ms. 372 the poem of "La Belle Dame sanz Mercy," first printed in W. Thynne's *Chaucer* (1532), has the ascription "Translatid out of Frenche by Sir Richard Ros." "La Belle Dame sanz Mercy" is a long and rather dull poem from the French of Alain Chartier, and dates from about the middle of the 15th century. It is written in the Midland dialect and is surprisingly modern in diction. The opening lines—

Half in a dreame, not fully wel awaked,
The golden sleep me wrapped under his wing,

have often been quoted, but the dialogue between the long-suffering lover and his lady does not maintain this level.

See W. W. Skeat, *Chaucerian and Other Pieces* (1897); and Dr H. Gröhler, *Ueber Richard Ros' mittelhochdeutsche Uebersetzung* . . . (Breslau, 1886).

ROSA, CARL AUGUST NICHOLAS (1842-1889), English musical impresario, was born at Hamburg on March 22, 1842, his family name (which he subsequently changed) being Rose. He started as a solo violinist, studying at Leipzig and Paris. In 1867 he met and married the famous operatic soprano Madame Parepa (1836-74). In 1875 he started the Carl Rosa Opera company. He died in Paris on April 30, 1889.

ROSA, SALVATOR (1615-1673), Italian painter of the Neapolitan school, was born in Arenella, in the outskirts of Naples, on July 21, 1615, according to Passeri. His father, Vito Antonio de Rosa, an architect, sent him to study in the convent of the Somaschi fathers. Salvator went to his uncle Paolo Greco to learn painting, then to his brother-in-law Francesco Fracanzano, a pupil of Ribera, and afterward to Ribera himself. He obtained some instruction under the battle-painter Aniello Falcone. Encouraged by Lanfranco, he went to Rome in 1635 to study, but catching fever, he returned to Naples and Falcone, and for a while painted nothing but battle-pieces. He went on to the landscape art peculiarly characteristic of him—wild scenes peopled with shepherds, seamen or, especially, soldiers. He then revisited Rome and was housed by Cardinal Brancaccio. In 1646 he took part in the insurrection of Masaniello against the Spaniards but on the approach of Don John of Austria he escaped to Rome. He was an actor, poet and musician as well as a painter. It was about this time that Rosa wrote his satire named *Babylon*, under which name Rome was indicated.

Cardinal Giancarlo de' Medici now invited the painter to Florence. Salvator remained in the Tuscan capital for the better part of nine years, introducing there the new style of landscape; he had no pupils, but various imitators. Lorenzo Lippi the painter poet, and other *beaux esprits* shared with Rosa the hospitalities

of the cardinal, and they formed an academy named *I Perceosi* (the Stricken). He was well acquainted also with Ugo and Giulio Maffei and housed with them more than once in Volterra, where he wrote four other satires—*Music*, *Poetry*, *Painting* and *War*. Finally he returned once more to Rome. To confute his detractors he wrote the last of the series, entitled *Envy*. Among the pictures of his closing years were the "Battlepiece" now in the Louvre; "Pythagoras and the Fishermen"; the "Oath of Catiline" (Pitti Gallery); and "Saul and the Witch of Endor" (Louvre), almost his latest work. He died on March 15, 1673.

His etchings reflect his sympathy with the rough and ready life of the soldier and peasant. He also produced a number of large mythological and historical plates.

See G. B. Passeri, *Vite dei Pittori, Scultori ed Architetti* (Rome, 1772); F. Baldinucci, *La Vita di S. Rosa* (Venice, 1830); Lady Morgan, *Life and Times of S. R.* (1824); G. A. Cesario, *Poesie e lettere di S. R.* (Naples, 1892); Leandro Ozzola, *Vita e Opere di Salvatore Rosa* (Siracusa, 1908); E. W. Manwaring, *Italian Landscape in 18th Century England* (New York, 1925).

ROSA, MONTE, the name of a great glacier-clad mountain mass (Aostan patois word *roëse*, a glacier) which rises southeast of Zermatt and on the frontier between Switzerland and Italy. Ten summits in this huge mass are distinguished by name, of which four (Nordend, 15,132 ft., Zumsteinspitze, 15,004 ft., Signalpuppe or Punta Gnifetti, 14,965 ft., and Parrotspitze, 14,643 ft.) rise on the frontier. The five lower summits are on the Italian slope, but the highest of all, the Dufourspitze, 15,217 ft. (named by the Swiss government in honour of General Dufour, the head of the survey which first accurately fixed the position of these points), rises west of the frontier ridge, on a buttress, and being entirely in Switzerland, is its highest peak (not, as often stated, the Dom, 14,942 ft., in the Mischabel group). The summit of the Dufourspitze was first attained in 1855 by a large English party, including G. and C. Smyth and C. Hudson. The Zumsteinspitze was first climbed in 1820, the Signalpuppe (on top of which there is now a club hut) in 1842, the Nordend in 1861 and the Parrotspitze in 1863.

ROSACEAE, a large cosmopolitan family of seed-bearing plants which belong to the series Rosales of dicotyledons and contain about 100 genera with about 2,000 species. The plants vary widely in manner of growth. Many are herbaceous, growing erect, as *Gesum*, or with slender creeping stem, as in species of *Potentilla*, sometimes sending out long runners, as in straw-

berry; others are shrubby, as raspberry, often associated with a scrambling habit, as in the brambles and roses, while apple, cherry, pear, plum and other British fruit trees represent the arborescent habit. Vegetative propagation takes place by means of runners, which root at the apex and form a new plant, as in strawberry; by suckers springing from the base of the shoot and rising to form new leafy shoots after running for some distance beneath the soil, as in raspberry; or by shoots produced from the roots, as in cherry or plum. The scrambling of the brambles and roses is effected by means of prickles on the branches and leaf-stalks.

The leaves, which are arranged alternately, are simple, as in apple, cherry, etc., but more often compound, with leaflets palmately arranged, as in strawberry and species of *Potentilla*, or pinnately arranged, as in the brambles, roses, mountain ash, etc. In warm climates the leaves are often leathery and evergreen. The leaves are stipulate, the stipules being sometimes small and short-lived, as in *Pyrus*, *Malus* and *Prunus* (cherry, plum, etc.), or more important structures adnate to the base of the leaf-stalk, as in roses, brambles, etc. The flowers, which are regular,

CHERRY (PRUNUS CERASUS)
A, Vertical section of the drupe of Cherry, cut vertically through the ventral and dorsal sutures; B, fruit cut vertically in a plane at right angle to preceding one

generally bisexual and often showy, are sometimes borne singly, as in some species of rose, or of the cloudberry (*Rubus chamaemorus*), or few or more together in a corymbose manner, as in some roses, hawthorn and others. The inflorescence in agrimony is a raceme, in *Poterium* a dense-flowered spike, in *Spiraea*, a number of cymes arranged in a corymb. The parts of the flowers are arranged on a pentamerous plan, with generally considerable increase in the number of stamens and carpels. The shape of the thalamus or floral receptacle, and the relative position and number of the stamens and carpels and the character of the fruit, vary widely and form distinguishing features of the different suborders, six of which may be recognized.

Suborder I. Spiraeoideae is characterized by a flat or slightly concave receptacle on which the carpels, frequently two to five in number, form a central whorl; each ovary contains several ovules, and the fruit is a follicle except in *Holodiscus*. The plants are generally shrubs with simple or compound leaves and racemes or panicles of numerous small white, rose or purple flowers. This suborder is nearly allied to the family Saxifragaceae, chiefly north temperate in distribution. The largest is *Spiraea*, numerous species of which are cultivated in gardens; *S. salicifolia* occurs in Britain apparently wild in plantations, but is not indigenous. The native British meadow-sweet is *S. ulmaria*; dropwort is *S. filipendula*, but some botanists now place the last two in a separate genus, *Filipendula*.

Suborder II. Pomoideae is characterized by a deep cup-shaped receptacle with the inner wall of which the two to five carpels are united; the carpels are also united with each other, and each contains generally two ovules. The fruit is made up of the large fleshy receptacle surrounding the ripe ovaries, the endocarp of which is leathery or stony and contains one seed. The plants are shrubs or trees with simple or pinnately compound leaves and white or rose-coloured often showy flowers. The genera are distributed through the north temperate zone, extending southward in the new world to the Andes of Peru and Chile.

While some botanists still continue to include the pears and the apples and even the mountain ash in *Pyrus* as a collective genus, most now recognize three genera; *Malus* to take the apples, a genus of about 25 species, the common apple being *Malus pumila*, formerly known as *Pyrus malus*; *Pyrus* to take the pears, a genus of about 20 species, the common pear being *Pyrus communis*; and *Sorbus*, a genus of about 80 species to take the rowan or mountain ash (*S. aucuparia*), wild service (*S. torminalis*), American mountain ash (*S. americana*), and white beam (*S. aria*). *Mespilus* (medlar), with a single species, and *Cotoneaster*, with about 50 species, are also included. All of these genera are confined to the north temperate zone.

Suborder III. Rosoideae is characterized by the receptacle being convex and swollen, as in strawberry, or cup-shaped, as in rose, and bearing numerous carpels, each of which contains one or two ovules, while the fruit is one-seeded and indehiscent. The genera are grouped in tribes according to the form of the receptacle and of the fruit. The Potentilleae bear the carpels on a large, rounded or convex outgrowth of the receptacle. In the large genus *Rubus* the ripe ovaries form drupelets upon the dry receptacles; the genus is almost cosmopolitan, but the majority of species occur in the forest region of the north temperate zone and in the mountains of tropical America. *R. fruticosus* is blackberry, *R. idaeus*,

raspberry and *R. chamaemorus*, cloudberry. In the flower of *Potentilla*, *Fragaria* (strawberry) and a few allied genera an epicalyx is formed by stipular structures arising at the base of the sepals. The fruits consist of numerous dry achenes borne in *Fragaria* on the much-enlarged succulent torus, which in the other genera is dry. In *Geum* (avens) and *Dryas* (an arctic and alpine genus) the style is persistent in the fruit, forming a feathery appendage (*Dryas*) or a barbed awn (avens), either of which is of service in distributing the fruit. The Potentilleae are chiefly north temperate, arctic and alpine plants.

The Rosaceae comprise the large genus *Rosa* (150 species), characterized by a more or less urn-shaped torus enclosing the numerous carpels which form dry one-seeded fruits enveloped in the bright-coloured fleshy torus. The plants are shrubs bearing prickles on the stems and leaves; many species have a scrambling habit resembling the brambles. The species of *Rosa*, like those of

Rubus, are extremely variable, and a great number of subspecies, varieties and forms have been described. Petals are often wanting, as in *Alchemilla* (lady's mantle) and *Poterium*, and the flowers are often unisexual and frequently wind-pollinated, as in salad burnet (*Sanguisorba minor*), where the small flowers are crowded in heads, the upper pistillate, with protruding feathery stigmas, and the lower staminate (or bisexual), with exserted stamens. *Agrimonia* (agrimony) has a long spike of small honeyless flowers with yellow petals; in the fruit the torus becomes hard and crowned by hooked bristles, which ensure the distribution of the enclosed achenes.

Suborder IV. Neurodoideae contains only two genera of desert-inhabiting herbs with yellow flowers; and the five to ten carpels are united together and with the base of the cup-shaped torus, which enlarges to form a dry covering round the one-seeded fruits.

Suborder V. Prunoideae is characterized by a free solitary carpel with a terminal style and two pendulous ovules, and the fruit a one-seeded drupe. The torus forms a cup from the edge of which spring the other parts of the flower. The plants are deciduous or evergreen trees or shrubs with simple leaves, often with small caducous stipules, and racemes or umbels of generally showy, white or pink flowers. There are five genera, the chief of which is *Prunus*, to which belong the plum (*Prunus communis*), with several well-marked subspecies—*P. spinosa* (sloe or blackthorn), *P. insititia* (bullace), *P. domestica* (wild plum), the almond (*P. amygdalus*) with the nearly allied peach (*P. persica*), cherry (*P. cerasus*), birdcherry (*P. padus*) and cherry laurel (*P. laurocerasus*). The tribe is distributed through the north temperate zone, passing into the tropics.

Suborder VI. Chrysobalanioideae resembles the last in having a single free carpel and the fruit a drupe, but differs in having the style basal, not terminal, and the ovules ascending, not pendulous;

FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)

FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)
VERTICAL SECTION OF FLOWER OF CHERRY

the flowers are also frequently zygomorphic. The genera are tropical evergreen trees or shrubs, the great majority being South American.

In North America the family is represented by about 40 genera, the largest being *Crataegus* (hawthorn) with about 70

FROM BROWN, "ELEMENTARY BOTANY" (G. BELL & SONS)
APPLE (*MALUS PUMILA*): SHOWING (A) VERTICAL SECTION THROUGH FRUIT, (B) ONE OF THE PARCHMENT-LIKE CHAMBERS, REMOVED FROM THE FRUIT CONTAINING A SEED

species, *Rubus* (bramble) with 40 species, *Potentilla* (cinquefoil, five-finger) with about 40 species, *Prunus* (plum, cherry, etc.) with 20 species, and *Rosa* with 15 species. *Potentilla* is the most generally distributed genus in the United States.

The family is characteristically typical of temperate and subtropical regions, but some genera, such as *Rubus*, are of world-wide distribution. The strictly tropical groups are mostly trees and shrubs in such genera as *Chrysobalanus*, *Hirtella*, *Coupeia*, *Parinarum*, etc.

ROSAMOND, known as "The Fair" (d. c. 1176), mistress of Henry II, king of England, is believed to have been the daughter of Walter de Clifford of the family of Fitz-Ponce. Rosamond is said to have been Henry's mistress secretly for several years, but was openly acknowledged by him only when he imprisoned his wife Eleanor of Aquitaine as a punishment for her encouragement of her sons in the rebellion of 1173-74. Rosamond died in 1176, and was buried in the nunnery church of Godstow before the high altar. The body was removed by order of St. Hugh, bishop of Lincoln, in 1191, and was, seemingly, reinterred in the chapter house. The story that she was poisoned by Queen Eleanor first appears in the French Chronicle of London in the 14th century. The romantic details of the labyrinth at Woodstock, and the clue which guided King Henry II to her bower, were the inventions of story-writers of later times. There is no evidence for the belief that she was the mother of Henry's natural son William Longsword, earl of Salisbury.

ROSARIO, a city and river port of Argentina, in the province of Santa Fé, on the west bank of the Paraná, 186 mi. by rail N.W. of Buenos Aires. Pop. (1943 estimate) 521,210. It ranks next to Buenos Aires in size and in trade. It is accessible to ocean-going steamers of 26 ft. draught. The city stands on the eastern margin of the great pampean plain, 65 to 75 ft. above the wide river-bed washed out by the Paraná. It extends back a considerable distance from the river. The city is laid out with chessboard regularity, with wide streets and spacious parks. The Boulevard El Santafesino is an attractive residence street with double drive-ways separated by a strip of garden and bordered by fine shade trees. The chief edifices of an official character are the custom-house, post office, municipal hall and law courts. Industries include sugar refining, flour milling, brewing, printing and the manufacture of bricks, leather, furniture and various kinds of food. The city is chiefly commercial, being the shipping port for a large part of northern Argentina. Among its exports are wheat, flour, baled hay, linseed, Indian corn, sugar, rum, cattle, hides, meats, wool, quebracho extract, etc. The railway connections are good in all directions except to the east across the Paraná river. A ferry service, however, connects the city with Victoria in the province of Entre Ríos to the east. The port of Rosario is well equipped with modern appliances for handling freight.

Rosario was founded in 1725 by Francisco Godoy, but it grew so slowly that it was still a small village up to the middle of the 19th century.

In 1854 Gen. Justo José de Urquiza, then at the head of the Argentine confederation, made it the port of the ten upper provinces then at war with Buenos Aires, and in 1857 imposed differential duties on the cargoes of vessels first breaking bulk at the southern port.

ROSARY, a popular devotion of the Roman Catholic Church, consisting of 15 Pater Nosters and Glorias and 150 Aves. The word also denotes the chaplet of beads for counting the prayers. It is divided into three parts, each containing five decades, a decade comprising one Pater, ten Aves and a Gloria, in addition to a subject for meditation selected from the "mysteries" of the life of Christ and of the Blessed Virgin. The Christian practice of repeating prayers is traceable to early times; Sozomen mentions (*H.E.*, v, 29) the hermit Paul of the 4th century who threw away a pebble as he recited each of his 300 daily prayers. It is not known precisely when the mechanical device of the rosary was first used. William of Malmesbury (*De gest. pont. Angl.*, iv, 4) says that Godiva, who founded a religious house at Coventry in 1043, left a string of jewels, on which she had told her prayers, that it might be hung on the statue of the Blessed Virgin. Thomas of Cantimpré, who wrote about the middle of the 13th century, first mentions the word "rosary" (*De apibus*, ii, 13), using it in a mystical sense as Mary's rose garden. Jacob Sprenger, a Dominican, founded the first confraternity of the Rosary at Cologne in 1474. The feast of the Rosary of the Blessed Virgin Mary was ordered to be observed on the first Sunday in October in such churches as maintained an altar in honour of the Rosary. Clement XI, by bull of Oct. 3, 1716, directed the observance of the feast by all Christians.

ROSAS, JUAN MANUEL DE (1793-1877), tyrant of Buenos Aires and outstanding figure in the history of Argentina, was born on March 30, 1793, in the city of Buenos Aires.

His father, Leon Ortiz de Rosas, was an owner of cattle runs (*estancias*) and a trader in hides who took an active part in defeating the English attack on Buenos Aires in 1807. Juan Rosas received so little education that he had to learn to read and write when he was already a married man and a successful cattle breeder. From an early age he was left in charge of one of his father's establishments. When he was 28 years of age he was married to Maria de la Encarnación Escurra. He left his parents and for some time subsisted by working as a *vagabundo*, or cowboy, and then as overseer on the estates of other owners; but he accumulated money, and by the help of a loan from a friend he became the owner of a cattle run of his own, Los Cerrillos.

The anarchical state of the country since winning its independence enabled him to obtain leave to arm his cowboys, who became the most efficient fighting force in the country. By adroit use of this weapon, and by strict attention to his own interest, he rapidly became the dominant figure in the province of Buenos Aires. As governor of the province from 1829 to 1832, he gave it the first peace it had known in 20 years, so that in 1835, after a brilliant Indian campaign, he was unanimously elected dictator of Buenos Aires, and held that position until 1852. Throughout his regime, he waged a war of extermination against the leaders of the interior provinces who sought to combine against him or to set up for

themselves as independent rulers. In spite of the continual combinations, domestic and foreign, in which this policy embroiled him, and of wars with Paraguay, Chile, Peru, Brazil, Uruguay, France and England, from which he had scarcely a moment's freedom, he broke the powers of the *caudillos* and upheld the supremacy of Buenos Aires in the country. In 1835 he was finally overthrown by a coalition of his neighbours and disaffected generals. He took refuge in England, at Swaythling, near Southampton, where he lived in poverty until his death on March 17, 1877.

(W. B. P.; X.)

ROSCELLINUS (RUCELINUS or ROUSSELLIN) (c. 1050–c. 1122), often called the founder of Nominalism (see SCHOLASTICISM), was born at Compiègne (Compendium). He studied at Soissons and Reims, was afterwards attached to the cathedral of Chartres, and became canon of Compiègne. It seems most probable that Roscellinus was not strictly the first to promulgate nominalistic doctrines; but in his exposition they received more definite expression, and, being applied to the dogma of the Trinity, attracted universal attention. Roscellinus maintained that it is merely a habit of speech which prevents our speaking of the three persons as three substances or three Gods. If it were otherwise, and the three persons were really one substance or thing (*una res*), we should be forced to admit that the Father and the Holy Spirit became incarnate along with the Son. Roscellinus seems to have put forward this doctrine in perfect good faith, and to have claimed for it at first the authority of Lanfranc and Anselm. In 1092, however, a council convoked by the archbishop of Reims condemned his interpretation, and Roscellinus, who was in danger of being stoned to death by the orthodox populace, recanted his error. He fled to England, but having made himself unpopular by an attack on the doctrines of Anselm, he left the country and repaired to Rome, where he was well received and became reconciled to the Church. He then returned to France, taught at Tours and Loc-menach (Loches) in Brittany (where he had Abelard as a pupil), and finally became canon of Besançon. He is heard of as late as 1122, when he came forward to oppose Abelard's views on the Trinity.

Of the writings of Roscellinus, nothing is preserved except a letter to Abelard, mainly concerned with the doctrine of the Trinity (ed. J. A. Schmeller, Munich, 1850). See F. Picaret, *Roscellin, philosophe et théologien* (1896), and authorities quoted under SCHOLASTICISM.

ROSCIUS GALLUS, QUINTUS (c. 126–62 B.C.), Roman actor, was born, a slave, at Solonium, near Lanuvium. He studied the delivery and gestures of the most distinguished advocates in the Forum, especially Q. Hortensius, and won universal praise for his grace and elegance on the stage. He especially excelled in comedy. Cicero took lessons from him. The two often engaged in friendly rivalry to try whether the orator or the actor could express a thought or emotion with the greater effect, and Roscius wrote a treatise in which he compared acting and oratory. Q. Lutatius Catulus composed a quatrain in his honour, and the dictator Sulla presented him with a gold ring, the badge of the equestrian order, a remarkable distinction for an actor in Rome, where the profession was held in contempt. Like his contemporary Aesop, Roscius amassed a large fortune, and he appears to have retired from the stage some time before his death. In 76 B.C. he was sued by C. Fannius Staeura for 50,000 sesterces (about £400), and was defended by Cicero in a famous speech.

See H. H. Pfäfer, *Cicero's Rede pro Q. Roscio Comedo* (1904).

ROSCOE, SIR HENRY ENFIELD (1833–1915), English chemist, was born in London on Jan. 7, 1833. After studying at University College, London, where he came under the influence of Graham and Williamson, he went to Heidelberg to work under R. W. Bunsen. In 1857 he succeeded Sir E. Frankland in the chair of chemistry at Owens College, Manchester, where he remained for 30 years, and from 1885 to 1895 he was M.P. for the south division of Manchester. He served on several royal commissions on educational questions, in which he was keenly interested, and from 1896 to 1902 was vice-chancellor of London University. He was elected a fellow of the Royal Society in 1863 and awarded a Royal Medal in 1873. He was knighted in 1884, and died at Leatherhead, Surrey, on Dec. 18, 1915.

Roscoe's first published paper (1854) deals with the analysis of certain varieties of gneiss, but this problem was set him in order to acquire analytical skill. His scientific work includes a memorable series of researches carried out with Bunsen between 1855 and 1862, in which they laid the foundations of comparative photochemistry; this work was subsequently continued by Roscoe alone. In 1867 he began an elaborate investigation of vanadium and its compounds, which probably constitutes his chief contribution to inorganic chemistry; he devised a process for preparing the metal in a pure state. He was the author of researches on niobium, tungsten, uranium, perchloric acid, the solubility of ammonia, etc. Roscoe also investigated the "constant boiling mixtures" of the common volatile acids with water; he proved that the compositions of the mixtures depended on the external pressure and so they could not be definite compounds. He was very interested in spectrum analysis, but although he lectured and wrote on the subject he did little research in this direction. His publications include: *Lectures on Spectrum Analysis* (1869); *A Treatise on Chemistry* (the first edition of which appeared in 1877–92); *A New View of Dalton's Atomic Theory*, with Dr. A. Harden (1896); and an *Autobiography* (1906). *The Treatise on Chemistry*, written in collaboration with Carl Schorlemmer (1834–92), is a standard work.

See Obituary notice, *Proc. Roy. Soc.*, vol. 93 (1916–17).

ROSCOE, WILLIAM (1753–1831), English historian and miscellaneous writer, was born on March 8, 1753 at Liverpool, the son of a market-gardener and publican. In 1769 he was articled to a solicitor, and in 1774 he commenced business as an attorney. Roscoe was also a political pamphleteer, and like many other Liberals of the day hailed the promise of liberty in the French Revolution. The commercial crisis of 1816 brought to Roscoe great difficulties, and forced him to sell his great collection of books and pictures. Some of these were secured by friends and found in the library of the Liverpool Athenaeum. Roscoe now placed a pleasant task in arranging the library of his friend Coke of Holkham. He died on June 10, 1831.

The first edition of his *Poetical Works* was published in 1837, and is sadly incomplete, omitting, with other verses known to be from his pen, the *Butterfly's Ball*, a fantasy, which has charmed thousands of children since it appeared in 1807. Other verses are in *Poems for Youth*, by a *Family Circle* (1820).

The *Life* by his son Henry Roscoe (2 vols., 1833) contains full details of Roscoe's career, and there are references to him in the *Autobiographical Sketches of De Quincy*, and in Washington Irving's *Sketch Book*.

ROSCOMMON, WENTWORTH DILLON, 4TH EARL OF (c. 1630–1685), English poet, was born in Ireland about 1630. He was a nephew of Thomas Wentworth, earl of Strafford, and was educated partly under a tutor at his uncle's seat in Yorkshire, partly at Caen in Normandy and partly at Rome. After the Restoration he returned to England, and was well received at court. In 1649 he had succeeded to the earldom of Roscommon, and he was now put in possession by act of parliament of all the lands possessed by his family before the Civil War.

His reputation as a didactic writer and critic rests on his blank verse translation of the *Ars Poetica* (1680) and his *Essay on Translated Verse* (1684). The essay contained the first definite enunciation of the principles of "poetic diction," which were to be fully developed in the reign of Queen Anne. Roscommon, who was fastidious in his notions of "dignified writing," was himself a very correct writer, and quite free from the indecencies of his contemporaries. He saw clearly that a low code of morals was necessarily followed by a corresponding degradation in literature, and he insists that sincerity and sympathy with the subject in hand are essential qualities in the poet. He has the distinctness of having been the first critic to avow his admiration for *Paradise Lost*. He was buried in Westminster Abbey on Jan. 21, 1685.

Roscommon's poems were collected in 1701, and are included in Anderson's and other collections of the British poets. He also translated into French from the English of Dr. W. Sherlock, *Traité touchant l'indolence passive* (1686).

ROSCOMMON, a county of Eire in the province of Connaught, bounded north-east by Leitrim, north-west by Sligo, west

by Mayo, west and south by Galway, east by Longford and east and south by Westmeath and Offaly county. The area is 608,540 ac., or about 951 sq. mi. Pop. (1936) 77,566. The greater part of the county belongs to the great limestone plain of central Ireland. In the north-east, on the Leitrim border, the Brailieue mountains, consisting of flat-topped ridges, attain an elevation in Cashel mountain of 1,377 ft.; and in the north-west the Curlew mountains, of similar formation, between Roscommon and Sligo, rise abruptly to a height over 800 feet. In the east the Slievebawn range, formed of sandstone, have a similar elevation. The Shannon forms nearly the whole eastern boundary of the county, and on the west the Suck from Mayo forms for over 50 m. the boundary with Galway till it unites with the Shannon at Shannon Bridge. The other tributaries of the Shannon within the county are the Arigna, the Feorish and the Boyle. The lakes formed by expansions of the Shannon on the borders of Co. Roscommon are Loughs Allen, Bodery, Boffin, Forbes and Ree. Other lakes within the county are Lough Key in the north and Lough Gara (mostly in Co. Sligo) in the north-west. The county town, Roscommon, has a population of (1936) 2,042.

The district was granted by Henry III. to Richard de Burgo, but remained almost wholly in the possession of the native septs. Until the time of Elizabeth, Connaught was included in the two districts of Roscommon and Clare, but in 1570 it was further subdivided by Sir Sydney, and was assigned its present limits. All the old proprietors were dispossessed at the Cromwellian settlement, except the O'Connor family headed by the O'Connor Don. Within the county are the ruins of Croghan, the palace of the kings of Connaught. The principal ancient castles are the stronghold of the M'Dermotts on Castle Island, Lough Key, the dismantled castle of the M'Donoughs at Ballinacra, and the extensive fortress at Roscommon rebuilt by John d'Ufford, justiciary of Ireland in 1268. There are fragments of a round tower at Oran. The abbey of Boyle is in good preservation, and has good Norman arches. The Irish bard Carolan, who died in 1738, is buried by the ruined church of Killoonan, in the extreme north of the county. The bishopric of Elphin was united with Kilmore and Ardagh in 1835, and the former cathedral and episcopal buildings are largely modernized.

The administrative county of Roscommon returns three members to Dáil Éireann.

ROSE, the name of a distinguished family of German chemists. VALENTINE ROSE the elder was born on Aug. 16, 1736 at Neu-Ruppin, and died on April 28, 1771 at Berlin, where he was an apothecary and, for a short time, assessor of the Ober Collegium Medicum. He was the discoverer of "Rose's fusible metal." His son, VALENTINE ROSE the younger, born on Oct. 31, 1762, at Berlin, was also an apothecary in that city and assessor of the Ober Collegium Medicum from 1797. It was he who in 1800 proved that sulphuric ether contains no sulphur. He died in Berlin on Aug. 10, 1807, leaving four sons, one of whom, Heinrich, was a distinguished chemist, and another, Gustav, a crystallographer and mineralogist. HEINRICH ROSE, born at Berlin on Aug. 6, 1795, began to learn pharmacy in Danzig. During the summer of 1816 he studied at Berlin under M. H. Klaproth, and in the autumn entered a pharmacy at Mitau. In 1819 he went to Stockholm, where he spent a year and a half with J. J. Berzelius, and in 1821 he graduated at Kiel. Returning to Berlin he became a *Privatdozent* in the university in 1822, extraordinary professor of chemistry in 1823 and ordinary professor in 1835, and there he died on Jan. 27, 1864. He devoted himself especially to inorganic chemistry and the development of analytical methods, and the results of his work are summed up in the successive issues of his classical work, *Ausführliches Handbuch der analytischen Chemie* (Berlin, 1829; 6th revised ed. in French, Paris, 1861). He was the discoverer of antimony pentachloride and Columbian compounds.

His brother, GUSTAV ROSE (1798-1873), born at Berlin where he became successively *Privatdozent* (1823), extraordinary professor of mineralogy (1826) and ordinary professor (1839). He explored Southern Asia under the direction of Humboldt, and also made detailed studies of Vesuvius and Etna and of the extinct volcanoes of Auvergne. The science of petrography,

according to G. vom Rath, originated with him. He was the first in his own country to use the reflecting goniometer for the measurement of the angles of crystals, and to teach the method of studying rocks by means of microscopic sections.

In addition to many scientific memoirs he published *Elemente der Kristallographie* (1830); *Mineralogisch-geognostische Reise nach dem Ural, dem Altai und dem Kaspischen Meere* (1837-42); *Das Kristallochemische Mineral-system* (1852); and *Beschreibung und Einteilung der Metacorten* (1863).

ROSE, JOHN HOLLAND (1855-1942), English historian, was born at Bedford, and educated at Owens college, Manchester. He was reader in modern history 1917-19, and Vere-Hamsworth professor of naval history 1919-33 at Cambridge university. His researches were directed to the French revolutionary and Napoleonic era on which he became a recognized authority.

His numerous historical works include *The Life of Napoleon I.* (1902); *The Development of the European Nations, 1870-1900* (1905); *William Pitt and the Great War* (1911); *The Personality of Napoleon* (1912); *The Origin of the War* (1914); *Nationality as a Factor in Modern History* (1916); *Man and the Sea* (1935), and many articles and papers.

ROSE (*Rosa*). The rose has for all ages been the favourite flower, and has a place in general literature that no other plant can rival. In most cases the rose of the poets and the rose of the botanist are one and the same in kind, but popular usage has attached the name rose to a variety of plants whose kinship to the true plant no botanist would for a moment admit. The rose gives its name to the family Rosaceae, of which it may be considered the type. The genus consists of species varying in number, according to the diverse opinions of botanists, from 30 to 180, or even 250, exclusive of the many hundreds of mere garden varieties. The wide discrepancy above alluded to illustrates very forcibly the extreme variability of the plants, their adaptability to various conditions, and consequently their wide dispersion over the globe, the facility with which they are cultivated, and the readiness with which new varieties are continually being produced in gardens by the art of the hybridizer or by careful selection. The species are natives of all parts of the Northern Hemisphere but, except at considerable elevations, are scantily represented in the Tropics.

They are erect or climbing shrubs, never herbs or trees, generally more or less copiously provided with straight or hooked prickles of various shapes and with glandular hairs, as in the sweet-brier or in the moss-rose of gardens. The leaves are invariably alternate, provided with stipules, and unequally pinnate, the leaflets varying in number from 1 to 11 and even 15, the odd leaflet always being at the apex, the others in pairs. The flowers are solitary or in loose cymes (cluster-roses) produced on the ends of the shoots. The flower-stalk expands into a vase- or urn-shaped dilatation, called the receptacle or receptacular tube, which ultimately becomes fleshy and encloses in its cavity the numerous carpels or fruits. From the edge of the urn or "hip" proceed five sepals, often more or less compound like the leaves and overlapping in the bud. Within the sepals are five petals, generally broad or roundish in outline, with a very short stalk or none at all, and of various shades of white, yellow or red. The very numerous stamens originate slightly above the sepals and petals; each has a slender filament and a small two-lobed anther. The carpels are very numerous, ultimately hard in texture, covered with hairs, and each provided with a long style and button-like stigma. The carpels are concealed within the receptacular tube and only the stigmas as a rule protrude from its mouth. Each carpel contains one ovule.

The so-called fruit is merely the receptacular tube, which, as previously mentioned, becomes fleshy and brightly coloured as an attraction to birds, which devour the hips and thus secure the dispersion of the seed. The stamens are in whorls, and, according to Payer, they originate in pairs one on each side of the base of each petal so that there are ten in each row; a second row of ten alternates with the first, a third with the second, and so on. By repeated radial and tangential branching a vast number of stamens are ultimately produced, and when these stamens assume a petaloid aspect we have as a consequence the double

flowers which are so much admired. Under natural circumstances rose flowers do not secrete honey, the attraction for insects being provided by the colour and perfume and the abundance of pollen for food. The stamens and anthers come to maturity at the same time, and thus, while cross-fertilization by insect agency is doubtless most common, self-fertilization is not prevented.

The large number of species, subspecies, varieties and forms described as British may be included under about 12 species. Among them may be mentioned *R. spinosissima*, the Scotch rose, much less variable than the others; *R. eglanteria*, the sweet-brier, represented by several varieties; *R. canina*, the dog rose, including numerous subspecies and varieties; the large-fruited apple rose, *R. pomifera*; and *R. arvensis*, the parent of the Ayrshire roses. Cultivated roses are frequently "budded" or worked upon the stems of the brier or *R. canina*, or upon young seedling plants of the same species; and, in tea roses, upon stems of the Manetti (*R. noisettiana*). Other species, notably *R. polyantha* and *R. rugosa*, also are used for stocks and do well.

The numerous forms native to North America may be referred to about 35 species. These are widely distributed and include several well-known wild roses. The smooth rose (*R. blanda*), usually lacking prickles, with flowers about 3 in. broad, occurs abundantly from Newfoundland to Saskatchewan and southward to New Jersey and Missouri. The prickly rose (*R. acicularis*), with spiny stems, leaves composed of from 5 to 9 leaflets, and solitary flowers, 2½ in. broad, ranges from Quebec to Alaska and south to Colorado. The pasture rose (*R. virginiana*), from ½ to 6 ft. high, with few or solitary flowers, 2 to 3 in. across, sometimes double, occurs from Newfoundland to Wisconsin and south to Georgia. This is the most common wild rose of the eastern states and Canada. The prairie rose (*R. setigera*), with climbing

DOG ROSE (*ROSA CANINA*), SHOWING SPRAY WITH FLOWERS, LEAVES AND THORNS

(A) Rose hips. (B) One hip cut vertically to show achenes or true fruits inside the ripened receptacle.

stems, leaves usually with three leaflets, bears rose-pink flowers which turn white with age. This handsome rose, which grows wild from Ontario to Wisconsin and south to Florida and Texas, has become naturalized eastward to New England. The California rose (*R. californica*), a sparsely prickly shrub, 3 to 9 ft. high, flowering nearly the year round, sometimes forms thickets along streams. The Cherokee rose (*R. laevigata*), a vigorous evergreen climber native to China and Japan, widely planted in the southern states and running wild as if indigenous, was first described botanically from American plants and is the state flower of Georgia.

Roses have been grown for so many centuries and have been crossed and recrossed so often that it is difficult to refer the cultivated forms to their wild prototypes. The older roses doubtless originated from *R. gallica*, the Provence rose, a native of central and southern Europe. *R. centifolia* (the cabbage rose), a native of the Caucasus, contributed its share. A cross between *R. gallica* and probably *R. chinensis* or *R. odorata* seems to have been the source of the important Bourbon roses. The yellow-flowered Austrian and Persian brier originated from *R. foetida*, a native of Austria and the east. The monthly or China roses sprang from *R. chinensis*, crossed with others of the *R. centifolia* or *gallica* type, and are the source of the "hybrid perpetuals." Tea roses and noisettes also acknowledge *R. chinensis* as one of their progenitors. A magnificent race called "hybrid teas" has been evolved by crossing the tea roses and hybrid perpetuals. They are much more vigorous in constitution than the true tea roses, while quite as beautiful in blossom and more perpetual in bloom than the hybrid perpetuals. By crossing the Japanese *R. wichuriana* with hybrid perpetuals a beautiful and vigorous race of climbers has been produced.

Lady Banks rose (*R. banksiae*) is a Chinese climbing species, with small white or fawn-coloured flowers of great beauty, but rarely seen; the Macartney rose (*R. bracteata*) is also of Chinese origin. Its nearly evergreen deep green leaves and large white flowers are very striking. The Japanese *R. rugosa* is also a remarkable species, notable for its bold rugose foliage, its large white or pink flowers and its conspicuous globular fruit. *R. damascena*, the damask rose, is cultivated in some parts of the Balkans for the purpose of making attar of roses. In Germany the same variety of rose is used, while at Grasse a strain of the Provence rose is cultivated for the same purpose. In India *R. damascena* is grown largely near Ghazipur for the purpose of procuring attar of roses and rose water. Rose water is chiefly produced in Europe from the Provence or cabbage rose, *R. centifolia*, grown for the purpose at Mitcham, England, and abundantly in the south of France.

Cultivation.—The rose is so universal a favourite that some portion of the garden must necessarily be devoted to it, if the situation be at all favourable. Many choice roses will not, however, thrive in the vicinity of large towns, since they require a pure air and do not endure a smoky atmosphere. The best soil for them is a deep rich strong loam free from stagnant moisture. Very light sandy or gravelly soils, or soils which are clayey and badly drained, are not suitable. Light soils would be improved by a dressing of strong loam in conjunction with cow-dung or stable manure. Heavy soils are improved by adding burned earth or gritty refuse, with stable manure and leaf-mould, peat moss litter, etc.; and damp soils must necessarily be drained by trenching. Tea roses may, however, be grown to perfection in a gravel soil, provided it be well manured. Roses generally require a constant annual supply of manure, and, if this is given as a mulching in autumn, it serves to protect their roots through the winter. They also require liberal supplies of water during the growing season, unless the surface is mulched or top-dressed from time to time with well-rotted manure or coco-nut fibre. Mulching with manure, however, during the growing season has the disadvantage that it enriches the top layer of soil and encourages the formation of surface roots, which often perish from lack of moisture during hot weather; and many growers prefer to rely on keeping a top mulch of fine soil by frequent and vigorous hoeing.

In England an open situation, not shaded but sheltered from strong winds, is what the rose prefers. October and November are the best months for planting roses, but if the weather be wet or frosty and the soil sticky, the plants should be placed in a sheltered place and protected by green boughs or matting until suitable conditions prevail. The planting should never be deep, the upper-most layer of roots being about 2 or 3 in. below the general level of the surface, and the soil should always be kept stirred with the hoe during the summer months. In regard to pruning, roses vary considerably, some requiring close cutting and others only thinning out; some again, such as strong growing climbers, may be safely pruned in autumn, and others are better left till

spring. Instructions on this point as to the several groups of varieties will be found in most rose catalogues. It may be laid down as a general rule that the more strongly growing varieties should be less severely cut back than the weakly varieties; and, again, the more tender the variety, the later in the spring should the pruning be done, April being the best month for pruning teas and noisettes.

In America these directions should be modified to the extent of providing partial shade in regions of intense summer heat. Also fall planting, while still preferred by some, can be replaced by early spring planting. In regions of intense cold the plants should be well cut back and the crowns be protected by a loose mulch of straw or by bagging.

Where dwarf beds of roses are required, a good plan is to peg down to within about 6 in. from the ground the strong one-year-old shoots from the root. In due time blooming shoots break out from nearly every eye, and masses of flowers are secured, while strong young shoots are thrown up from the centre, the plant being on its own roots. Before winter sets in, the old shoots which have thus flowered and exhausted themselves are cut away, and three or four or more of the strongest and best ripened young shoots are reserved for pegging down the following season, which should be done about March. In the meantime, after the pruning has been effected, plenty of good manure should have been dug in lightly about the roots. Thus treated, the plants never fail to produce plenty of strong wood for pegging down each succeeding season.

One of the most troublesome fungoid pests of the rose is mildew. The young shoots, leaves and flower-buds frequently become covered with a delicate white mycelium, which by means of the suckers it sends into the underlying cells robs its host of considerable amounts of food and causes the leaves to curl and fall early. The spores are produced in great abundance and carried by animals and the wind to other plants, and so the disease is rapidly spread. Later the mycelium increases and forms a thick velvety coating on the young shoots, and in this the winter stage of the fungus is produced. Spraying with potassium sulphide (1 oz. to 2 to 3 gal. of water) is a good means of checking the spread of the disease.

The rose rust appears on both cultivated and wild roses in the spring, bursting through the bark in the form of copious masses of orange powder consisting of the spores of the fungus. These spores infect the leaves and produce on them in the summer small dots of an orange colour and, later, groups of spores that are able to live through the winter. It is therefore important that all the affected leaves should be destroyed in the autumn, and the bushes should be sprayed with a copper mixture in the spring to prevent the infection of the leaves by spores brought from a distance. Many other fungi attack the rose, but perhaps the only other one that merits mention here is Black Spot. This attacks the leaves, forming large dark blotches upon them and frequently causing them to fall prematurely. It can be controlled by dusting with sulphur.

A very large number of insect pests are found upon the rose, but the best known and most formidable on account of their great powers of reproduction are the aphides. Their attack should be checked by the use of a nicotine spray or powder. The larvae of some of the *Tortrix* moths fold the leaves almost as soon as they are developed from the bud, and do considerable damage in this way and by devouring the leaves, while several "looper" caterpillars are also found feeding on the foliage. Many species of saw-fly larvae are also known to attack the rose, feeding either upon the leaves or devouring the young shoot. These larvae should be carefully searched for and destroyed whenever found.

19-X

ROSEBERY, ARCHIBALD PHILIP PRIMROSE, 5TH EARL OF (1847-1929), British statesman, born in London on May 7, 1847, was the son of Archibald, Lord Dalmeny (1809-1851) and Catherine, daughter of the 4th earl Stanhope. Lady Dalmeny married, after her husband's death, the duke of Cleveland. Young Dalmeny was educated at Brighton and at Eton, where he had as slightly junior contemporaries A. J. Balfour and Randolph Churchill. In 1866 he matriculated at Christ Church, Oxford, but went down in 1868, by the request of the dean, rather than abandon the possession of a small racing stud. In the same year he succeeded his grandfather, the 4th earl, in the earldom and the family estates. After some time spent in travel he acquired an English country house called The Durdans, Epsom, which he largely rebuilt and adorned with some of the finest turf portraits of George Stubbs. He had a famous stable, and, later, won the Derby three times, in 1894, 1895 and 1905. In 1878 he married Hannah, only child of Baron Meyer Amschel de Rothschild.

Though impeded in his political career by his exclusion from the House of Commons, Lord Rosebery's reputation as a social reformer and orator was steadily growing. In 1878 he was elected Lord Rector of Aberdeen and in 1880 of Edinburgh University, where he gave an eloquent address upon Patriotism. In 1880 he entertained Gladstone at Dalmeny, and during the "Mid Lothian campaign" he arranged the demonstrations. In August 1881 he became under-secretary at the home office, his immediate chief being William Harcourt. His work was practically confined to the direction of the Scottish department of the office, and he resigned in 1883. He resumed office (1884) as first commissioner of works with a seat in the cabinet.

In the brief Gladstonian government of 1886 Lord Rosebery threw in his lot with the old leader, and was foreign secretary. His views on foreign policy differed materially from those of Granville and Gladstone. His mind was dwelling constantly upon the political legacy of the two Pitts; he was a reader of John Seeley; he had himself visited the colonies; had predicted that a war would not, as was commonly said, disintegrate the empire, but rather the reverse; had magnified the importance of taking colonial opinion, and had always been a convinced advocate of some form of Imperial Federation. He was already taunted with being an Imperialist, but his independent attitude won public approval. In January 1889 he was elected a member of the first county council of London, and on Feb. 12, chairman of that body by 104 votes to 17. With a view to the impending political campaign he found it necessary to resign the chairmanship of the county council in June. In November of this year, however, Lady Rosebery died, and he withdrew for a period from public business. In January 1892 he again for a few months became chairman of the county council. In October he received the Garter.

In August 1892, upon the return of Gladstone to power, he was induced with some difficulty (for he was suffering at the time from insomnia) to resume his position as foreign minister. He strongly opposed the evacuation of Egypt; he insisted upon the exclusive control by Great Britain of the Upper Nile Valley, and also upon the retention of Uganda. In 1893 the question of Siam came near to causing serious trouble with France, but the crisis was averted, and the lines were laid down for preserving Siam, if possible, as a buffer state between the English and French frontiers in Indo-China. In the spring of 1895 he was clear-sighted enough to refuse to join the anti-Japanese league of Russia, France and Germany at the end of the China-Japan War.

Lord Rosebery's personal popularity had been increased at home by his successful intervention in the coal strike of December 1893, and when in March 1894 the resignation of Gladstone was announced, his selection by Queen Victoria for the premiership was generally welcomed, but the malcontents in his own party, who considered that William Harcourt should have been the prime minister, or who were perpetually intriguing against a leader who did not satisfy their idea of radicalism, made Lord Rosebery's personal position no easy one. The support of the Irish Nationalists was endangered by his insistence that the goodwill of England, the "predominant partner," was essential to the success of Home Rule. On June 24, 1895, the government fell.

For the state of disorganization and discontent in the Liberal Party during the next ten years of opposition see **LIBERAL PARTY**. The breach between William Harcourt and Rosebery had never been healed, and Rosebery found himself also, to his great grief, at variance with Gladstone. He declined to support Gladstone's demand for intervention on behalf of the Armenians at the risk of a European war, and on Oct. 8, 1896, he announced to the Liberal whip, Thomas Ellis, his resignation of the Liberal leadership. For some time he held aloof from party politics, "ploughing his furrow alone," as he afterwards phrased it.

In 1898, on the death of Gladstone, he paid a noble and eloquent tribute in the House of Lords to the life and public services of his old leader. He gave a general support to the policy of the Salisbury government on the South African War. But the war had brought to the front a section antagonistic to the war and known in the jargon of the day as pro-Boers. These had won the qualified support of Campbell-Bannerman, the leader in the House of Commons. Lord Rosebery maintained for the most part a sphinx-like seclusion, but in July 1901 he at last came forward strongly as the champion of the Liberal Imperialist section of the party, which included Asquith, Grey and Haldane. At a meeting at Chesterfield (Dec. 1901), he spoke of "cleaning the slate" of the old party crises, and eventually spoke of his separation from the "tabernacle" of Campbell-Bannerman. But the main body of the party stood by Campbell-Bannerman, and a partial reconciliation was effected. Chamberlain's tariff reform campaign helped to bring the Liberal Imperialists nearer to the rest of the party. Rosebery's own pronouncements on the tariff issue were hesitating, and to some extent contradictory. But though he eventually came into line with his colleagues on tariff reform, he finally broke with Campbell-Bannerman on the question of Home Rule for Ireland. On the fall of the Conservative government in Dec. 1905, Campbell-Bannerman was invited to form a cabinet, and Rosebery retired from party politics, though he encouraged his immediate associates to join the new government.

Rosebery continued eloquent and witty addresses on miscellaneous subjects. No public man of his time was more fitted to act as unofficial national orator; none more happy in the touches with which he could adorn a social or literary topic and charm a non-political audience; and on occasion he wrote as well as he spoke. His *Pitt* (1891) was already a classic; his *Appreciations and Addresses* and his *Peel* (containing a remarkable comment on the position of an English prime minister) were published in 1899; his *Napoleon: the Last Phase*—an ingenious, if paradoxical attempt to justify Napoleon's conduct in exile at St. Helena—in 1900; his *Cromwell* in the same year.

Lord Rosebery took an active part in the constitutional crisis in 1910 and 1911. He treated the Parliament Bill as a revolutionary measure, which in effect constituted single-chamber government, and did his utmost to arouse the nation to its danger. In 1914, as lord-lieutenant of Midlothian and Linlithgowshire he promoted recruiting and other war-like activities among his own people. He was chancellor of Glasgow university in 1908, as he had long been chancellor of London university, and he was chosen lord rector of St. Andrew's university for the year of its quinquennial celebration in 1911.

Lord Rosebery had two sons and two daughters. His eldest son, Lord Dalmeny (b. Jan. 1882), entered parliament in 1906 as Liberal member for Midlothian, but retired in 1910. The younger son, Neil Primrose (1882-1917) was undersecretary for the Foreign Office in 1915 and parliamentary secretary for munitions in 1916. He died of wounds received in action in Palestine on Nov. 28, 1917. The elder daughter, Lady Sybil, in 1903 married Captain Charles Grant; the younger, Lady Margaret, in 1899 married the 1st earl of Creve. Lord Rosebery died at Epsom, Surrey, May 21, 1929.

ROSEBURG, a city of western Oregon, U.S., 196 mi. S. of Portland; county seat of Douglas county; it is located on federal highway 99 and the Southern Pacific railroad. Pop. (1950) 8,390. Timber resources of the area have been estimated as 70,000,000-cu. bd.ft. The city was founded in 1852 and incorporated in 1872.

ROSECRANS, WILLIAM STARKE (1819-1898), American soldier, was born in Kingston (O.), on Sept. 6, 1819, and graduated in 1842 from the U.S. Military Academy. After serving (1843-47) as assistant professor at West Point, he resigned (April 1854) and went into business in Cincinnati. On the outbreak of the Civil War he volunteered for service under McClellan and helped raise the Ohio "Home Guards," with which he served in the West Virginian operations of 1861 as brigadier general. He was second in command to McClellan during this campaign, and succeeded to the command when that officer was called to Washington. In the latter part of 1861 he conducted further successful operations in the same region, and early in 1862 was transferred to the West as a major general of volunteers. He took part in the operations against Corinth, and when Gen. John Pope was ordered to Virginia, Rosecrans took over command of the army of the Mississippi, with which he fought the successful battles of Iuka and Corinth. Soon afterwards he replaced D. C. Buell in command of the forces. In December he advanced against Gen. Braxton Bragg, and on Dec. 31 to Jan. 3 fought the bloody, indecisive battle of Stone River (Murfreesboro), after which Bragg withdrew his army to the southward. In 1863 Rosecrans, refusing to advance until the isolation of Vicksburg was assured, did not take the offensive until late in June. The operations thus begun were most skillfully conducted and Bragg was forced back to Chattanooga, whence he had to retire. But Rosecrans sustained a great defeat at the battle of Chickamauga (9.v.), and was soon besieged in Chattanooga. He was then relieved from his command. Later he did good service in Missouri, and in March 1865 was made brevet-major general U.S.A. He resigned in 1867, and in 1868 became minister to Mexico. He was a representative in Congress from California, 1881-85, and register of the treasury, 1885-93. Under an act of Congress he was, on March 2, 1889, restored to the rank of brigadier general and retired. He died near Redondo (Calif.), March 11, 1898. On May 17, 1903 his body was reinterred with military honours in the National Cemetery at Arlington.

See Edward Channing, *History*, vol. vi, J. B. McMaster, *History of the People During Abraham Lincoln's Administration* (1927).

ROSEGGGER, PETER (1843-1918), Austrian poet and novelist, known down to 1894 under the pseudonym *Petri Kettenfeier*, was born at Alpi near Krieglach in Upper Styria, on July 31, 1843, the son of a peasant. His work includes novels, poems, religious writings and autobiographical volumes, notably *Waldheimat* (1873) and *Mein Weltleben* (1898).

ROSELLE AND ROSELLE PARK, two contiguous boroughs of Union county, New Jersey, U.S.A., adjoining Elizabeth on the west; served by the Central of New Jersey, the Lehigh Valley and (for freight) the Rahway Valley railways. The population of the borough of Roselle in the year 1950 was 17,646 and of Roselle Park in the same year 11,521.

ROSELLINI, IPPOLITO (1800-1843), Italian Egyptologist, was born at Pisa. He studied under Mezzofanti at Bologna, and in 1824 became professor of oriental languages at Pisa. He was the associate of J. F. Champollion (9.v.) in his Egyptian explorations (1828), the account of which he published as *Monumenti dell'Egitto e della Nubia* (Florence, 1832-40, 10 vols. fol.).

ROSEMARY, botanically *Rosmarinus officinalis*, a plant of the mint family (Labiatae), the only representative of the genus and a native of the Mediterranean region. It is a low shrub with linear leaves, dark green above, white beneath, and with margins rolled back on to the under face. The flowers are in small axillary clusters. Each has a two-lipped calyx, from which projects a bluish two-lipped corolla enclosing two stamens. The fruit consists of four smooth nutlets. Rosemary was highly esteemed by the ancients for its aromatic quality and medicinal uses. In modern times it is valued mainly for its perfume; the oil is obtained by distillation. Rosemary plays an important part in literature and folk-lore, being an emblem of remembrance.

ROSENHEIM, German town and watering-place in Upper Bavaria, at the confluence of the Mangfall and the Inn, 40 m. by rail S.E. of Munich. Pop. (1939) 21,340. Rosenheim is frequented for its saline and sulphur baths, and there are saltworks.

a coffered vault or ceiling. The rosette almost went out of use in the mediaeval period save as it sometimes occurred as an individual flower in Gothic naturalistic ornament. In the perpendicular period in England, the popularity of the heraldic Tudor rose gave a new importance to the rosette idea, and rosettes were frequently employed, repeated at regular intervals, to decorate hollow mouldings. Renaissance rosettes in design are based upon those of Rome, but were used even more lavishly, owing to the immense development of wooden coffered and panelled ceilings.

In metalwork the idea of the rosette was probably developed independently, owing to the ease with which little drops of metal could be soldered or fastened in a circle, to a basic utensil. Such rosettes, formed either of a simple circle of nearly hemispherical shape, or of one large hemisphere surrounded by several smaller ones, are favourite late Bronze and early Iron age decorations in the metalwork of the Celts, Scandinavians and the people of northern Europe generally.

ROSEVILLE, a city of Placer county, Calif., U.S., 13 mi. N.E. of Sacramento. Pop. (1950) 8,733; (1940) 6,425. It is at the junction of federal highways 40 and 99 and on the main lines of the Southern Pacific railroad. The railroad maintains an immense railroad construction and repair shop and there is a large diesel terminal. The freight classification yards are the largest west of Chicago, Ill. The Pacific Fruit Express company maintains a large ice-manufacturing and storage plant for the refrigeration of fruit and vegetable cars.

ROSE WINDOW or **WHEEL WINDOW**, in architecture, a term applied to any decorated circular window. Undecorated circular windows are found in certain imperial Roman structures, used especially in the upper portions of rooms or pierced through vaults, as in the tomb of the time of Hadrian known as the *Casale dei Pazzi*, near Rome, but structural decoration of such forms was apparently not attempted until the Byzantine and Romanesque periods.

One of the earliest decorated circular windows extant is that of the Italian Romanesque church of S. Maria in Pomposa, possibly as early as the 10th century, in which the decoration consists of a pierced marble slab of great richness, with a design of interlaces and birds purely Byzantine. In French Romanesque work circular windows also appear, but in the earlier work, such as the late 11th century rose of S. Germain at Tournai, they are undecorated, like those of the Roman empire. Meanwhile, in Mohammedan work, the cusped circle had been a common form, usually, however, not as a window, but as the outer boundary of a sunk hemisphere, as in the mosque of Ibn Tuloun at Cairo, Egypt. (876-78).

The crusaders probably saw many examples of such forms in any case: it is only after the earlier crusades and especially towards the middle of the 12th century that the idea of making a rich decorative motive out of a round window appeared. From then on the simple rose window became more and more common, and was, in fact, a distinguishing characteristic of many transitional and early Gothic cathedrals. It was particularly used at the west end of the nave and the ends of the transepts. An exceptional early use is the round window which lighted the triforium roof space from the nave in the original form of Notre Dame at Paris (before 1177). In the west front of Leam cathedral (completed prior to 1200) there is an enormous rose window with 12 semicircles around the edge and the central folled and cusped circle separated from the apexes of these semicircles by a considerable distance, the connection between being made by little radiating colonnettes like spokes. This window is remarkably advanced for its date, as the filling, like that of the Paris triforium, is essentially tracery. The rose window of the west front of Chartres cathedral (1190-1212) consists, on the other hand, of plate tracery, the circle being filled with a thin plate of stone, through which are pierced many small folled or cusped holes. A similar form of plate tracery within a circle is used to cap the twin windows of the clerestory bays.

The introduction of developed bar tracery gave a compelling impetus to rose window design. The general scheme consisted of a series of radiating forms, each of which was tipped by a pointed arch at the outside of the circle. The bars between these forms were joined at the centre by a pierced circle of stone and the forms themselves frequently treated like little traceried windows with subsidiary, subdividing bars, arches and folled circles. The most beautiful examples of this type are those of the west front of Rheims cathedral (end of the 13th century) and the transepts of Rheims, Amiens and Notre Dame at Paris (all of the last half of the 13th century). The introduction of the wavy lines of flamboyant tracery completely changed the character of French rose windows, but they continued basically radiating in design. The radiating elements consisted of an intricate network of wavy, double curved bars, creating all sorts of interesting circles and flame shapes and, incidentally, furnishing a diagonal brace to the whole composition which added materially to its structural strength. The rose at the end of the transept at Beauvais (early 16th

century) is characteristic.

The influence of the French rose windows was widespread from an early period. Variations of the form appear in a multitude of late Italian Romanesque churches, as in the widely varying type in the late 12th century west front of S. Pietro in Toscanella, and the more normal example in S. Zeno at Verona (late 12th century). In England the rose window has never been so popular as in France. Those in the transepts of Westminster abbey are more characteristically French than English. The most typically English examples are in the transepts of Lincoln cathedral, that on the north from the Early English period is a remarkably delicate example of plate tracery; that on the south from the Curvilinear period of the early 14th century is striking because it is not radiating in design, and therefore completely at odds with the French prototypes. (See *TRACEARY*.) (T. F. H.)

ROSEWOOD, the name given to several distinct kinds of ornamental timber. That, however, so called in the United Kingdom is Brazilian rosewood, the *palissandre* of the French, the finest qualities of which, coming from the provinces of Rio de Janeiro and Bahia, are believed to be the produce principally of *Dalbergia nigra*, a leguminous tree of large dimensions, called *cabiana* and *Jacaranda* by the Brazilians. The same name, *Jacaranda*, is applied to several species of *Machaerium*, also trees belonging to the family Leguminosae; and there can be no doubt that a certain proportion of the rosewood of commerce is drawn from these sources.

Rosewood is exported in large quantities from Rio de Janeiro, Bahia, Jamaica and Honduras. The heartwood attains large dimensions, but as it begins to decay before the tree arrives at maturity it is always faulty and hollow in the centre. On this account squared logs or planks of rosewood are never seen, the wood being imported in half-round billets 20 to 20 ft. in length and from 5 to 12 in. in their thickest part. Rosewood has a deep ruddy brown colour, richly streaked and grained with black resinous layers. It takes a fine polish, but, on account of its resinous nature, it is somewhat difficult to work. The wood is very much in demand by cabinetmakers and piano makers.

ROSICRUCIANISM. There are Rosicrucian societies, fraternities, orders, fellowships or lodges in most countries of the modern world. Some of them are very active; others are obscure and highly secret; some seem to be primarily religious in their emphasis, and some categorically deny that Rosicrucianism is a religion, holding rather that it is a philosophy, making use of the most modern scientific methods and techniques, as well as methods of the occultist, the mystic and the seer, in the quest for truth.

But, while Rosicrucianism is sectarian in character and the various branches are sometimes bitterly critical of each other, they do have common features, the central one being the purported possession of certain secret wisdom handed down from ancient times, through a secret brotherhood, an esoteric wisdom that can only be imparted to the initiated. Their teachings so far as known seem to combine something of Egyptian Hermeticism, Christian Gnosticism, Jewish Kabbalism, alchemy and a variety of other occult beliefs and practices. While alchemy seems to have been prominent in the movement, modern Rosicrucians affirm that their language must be taken symbolically rather than literally and that they have no interest in such things as the transmutation of metals.

Whether all Rosicrucian organisations can trace their origins back to the main historic stream of Rosicrucianism is a matter of grave doubt. But after all, what is the true Rosicrucianism?

The earliest extant writing which unequivocally mentions a Rosicrucian order appeared in the early 17th century. But even here the actual existence of such an order cannot be affirmed absolutely. Indeed, not a few scholars believe rather that the order had its rise from the publication of this document and that it was written with this definite purpose in mind.

The document was the famous *Pama Fraternitatis*, first published in 1614 but probably circulated in manuscript form somewhat earlier than this. Seven editions appeared during the years 1614-17. It recounts the journey of the reputed founder of the movement, Christian Rosenkreuz, to Damascus, Damcar in Arabia, Egypt and Fez, where he was well received and came into possession of much secret wisdom. He returned finally to Germany, where he chose three others to whom he imparted this wisdom and thus founded the order. Later the number was increased to eight who separated, each going to a separate country.

One of the six articles of agreement they adopted was that the fraternity should remain secret for 100 years. At the end of 120 years

the secret burial place and the perfectly preserved body of the founder were discovered by one of the then members of the order, along with certain documents and symbols held in very high esteem by the Rosicrucians. The sacred vault was re-covered, the members of the order dispersed, and no one knows its location. The *Fama* ends with an invitation to "some few" to join the fraternity.

According to the *Confessio*, which is bound up with the *Fama* in some of the editions, Christian Rosenkreuz was born in 1378 and lived 106 years, or until 1484. His tomb was then hidden in a cave for 500 years, making its discovery fall in 1604. If this is a true account of the founding of the order, it must have come into being sometime in the 15th century.

Some regard the story as a statement of fact, and hold Christian Rosenkreuz to have been the founder of the order. More generally it is held to be a mythical explanation of the order, and Christian Rosenkreuz is a real person at all, but rather a symbolic character. R. Swinburne Clymer saw in the travels of Christian Rosenkreuz in the *Fama* an obvious parallel to the travels of Paracelsus, whom he regarded as the real founder of the movement. H. Spencer Lewis held that it marks only a revival of the order which began in remote antiquity in Egypt, where the great Akhnaton made significant contributions to it. He listed numerous persons of antiquity, including Solomon, Jesus, Plato, Philo, Plotinus and others, as well as movements such as the Essenes of Jesus' day, the young Christian movement itself, and later movements such as Jewish Kabbalism, as related to the ancient order. These he identified as truly Rosicrucian because he was able to find among their reported teachings ideas which he regarded as Rosicrucian. His conclusions do not seem convincing to objective students. There can be no doubt that there were in ancient times persons whose outlook and thought were similar to that of the Rosicrucians. That there was a continuing order in existence previous to the 15th century, or even the 17th, is impossible to prove beyond question, on the basis of any sources available to non-Rosicrucian research.

With the publication of the *Fama*, international interest in the order was aroused and it was not long before there were Rosicrucian orders in several European countries. Michael Maier, a learned alchemist, became its chief exponent in Germany. Robert Fludd is thought to have introduced it into England. Thomas Vaughan translated the *Fama* into English in 1654, and though he knew of no existing order in England at that time, he remarked that he was not unacquainted with Rosicrucian doctrine and had no doubt concerning the existence of the order.

That it is not always possible to prove the existence of the order in a given country at any particular moment does not disturb the Rosicrucians, for it seems to be recognized that there occur periods when the order is deliberately "in sleep." H. Spencer Lewis reduced these periods to a definite rhythm of 108 years of activity followed by 108 years of silence, a given country always according with this cyclic theory, he said, and he was led at the proper time to seek out the leaders of the order in France in the early years of the 20th century and under their authority to inaugurate a new cycle of activity in the United States in 1915, under the name Ancient Mystical Order Rosae Crucis, usually abbreviated to A.M.O.R.C. It became affiliated with the Fédération Universelle des Ordres et Sociétés Initiatives, established in Europe in 1934.

R. Swinburne Clymer, head of a rival U.S. order with headquarters at Quakertown, Pa., who as early as 1902 published *The Rosicrucians: Their Teachings*, spoke of the periods of silence, but these were determined by specific conditions rather than by the passage of time. His organization, traced through a definite line of Rosicrucian adepts in the U.S. from revolutionary times, with Paschal Beverly Randolph and Freeman B. Dowd as his more immediate predecessors, is known as the Fraternitas Rosae Crucis. Its foreign affiliation was with La Fédération Universelle des Ordres, Sociétés et Fraternités des Initiés. Rosicrucianism and Freemasonry have no common link in common. Indeed, there is a degree of masonry known as the Rose Croix degree. Likewise, the *Societas Rosicruciana in Anglia* and its affiliates are held to be more masonic than Rosicrucian.

The symbol of Rosicrucianism is a combination of the cross and the rose, from which the order takes its name. The origin of the symbol is variously given, but there seems to be no one explanation which is completely satisfactory.

ROSIN or **COLOPHONY**, the resinous constituent of the oleoresin exuded by various species of pine, known in commerce as crude turpentine. The separation of the oleoresin into the essential oil spirit of turpentine and common rosin is effected by distillation in large stills. Rosin (a later variant of "resin," *q.v.*), varies

in colour, according to the age of the tree from which the turpentine is drawn and the amount of heat applied in distillation, from an opaque almost pitchy black substance through grades of brown and yellow to an almost perfectly transparent colourless glassy mass. The commercial grades are numerous, ranging by letters from A, the darkest, to N, extra pale, and X, most pale, W (window glass) and WW (very white) varieties, the latter having about three times the value of the common qualities.

Rosin is a brittle and friable resin, with a faint pine-like odour; the melting point varies with different specimens, some being semifluid at the temperature of boiling water, while others do not melt till 220° F. or 250° F. It is soluble in alcohol, ether, benzene and chloroform. In addition to its extensive use in soapmaking, rosin is largely employed as a sizing agent in the manufacture of paper. It is also used for preparing shoemakers' wax, as a flux for soldering metals, for pitching lager beer casks, for rosining the bows of musical instruments, etc.

In pharmacy it forms an ingredient in several plasters and ointments. The chief region of rosin production is the south Atlantic and eastern gulf states of the United States. American rosin is obtained from the turpentine of the swamp pine, *Pinus palustris*, and of the loblolly pine, *P. taeda*. The main source of supply in Europe is the "landes" of the departments of Gironde and Landes in France, where the cluster pine, *P. pinaster*, is extensively cultivated. In the north of Europe rosin is obtained from the Scotch fir, *P. sylvestris*, and throughout European countries local supplies are obtained from other species of pine.

ROSKILDE, or **ROESKILDE**, a town of Denmark in the amt (county) of Kjøbenhavn (Copenhagen), 20 mi. by rail W. of Copenhagen, on the great lagoon-like inlet named Roskilde fjord. Pop. (1950) 26,355. Its chief interest is historical. It was the capital of the kingdom until 1443, and the residence of the bishops of Zealand until the Reformation. The cathedral was consecrated in 1084, but of this early building only foundation walls remain; the present structure of brick was begun in 1215, and enlarged and restored at various later dates. It contains the tombs of most of the Danish kings from Harold I (987).

ROSMEAD, HERCULES GEORGE ROBERT ROBINSON, 1st Baron (1824-1897), British colonial administrator, was born on Dec. 19, 1824. He was of Irish descent on both sides; his father was Admiral Hercules Robinson, his mother a Miss Wood of Rosmead, County Westmeath, from which he afterward took his title. Passing from Sandhurst into the 87th Foot, he attained the rank of captain; but in 1846, through the influence of Lord Naas, he obtained a post in the board of public works in Ireland, and subsequently became chief commissioner of fairs and markets. His energy in these positions, notably during the famine of 1848, and the clearness and vigour of his reports, secured for him at the age of 30 the office of president of the island of Montserrat. He was governor of St. Christopher from 1855 to 1859, when he was knighted in recognition of his services in introducing coolie labour into the island. Subsequently he was governor of Hong Kong, of Ceylon (C.M.C.G. in 1869), and, in 1872, of New South Wales. It fell to his lot to annex the Fiji Islands to the British empire, and his services were rewarded in 1875 by promotion to G.C.M.G. In 1879 he was transferred to New Zealand, and in 1880 he succeeded Sir Bartle Frere as high commissioner of South Africa. He arrived in South Africa shortly before the disaster of Majuba, and was one of the commissioners for negotiating a peace which was personally distasteful to him. It left him with the task of conciliating on the one hand a Dutch party elated with victory, and on the other hand a British party almost ready to despair of the British connection. He was called home in 1883 to advise the government on the terms of the new convention concluded with the Transvaal Boers in Feb. 1884. On his return to South Africa he found that a critical situation had arisen in Bechuanaland, where Boer commandos had seized large tracts of territory and proclaimed the "republics" of Stella and Goshen (see KRUGER, STEPHANUS JOHANNES PAULUS). They refused to retire within the limits of the Transvaal as defined by the new convention, and Robinson, alive to the necessity of preserving this country—the main road to the north—for Great Britain, took action which led to the expedition of Sir Charles Warren and the annexation of Bechuanaland early in 1885. Robinson won Kruger's confidence by his fair-mindedness, while he seconded Rhodes's efforts to unite the British and Dutch parties in Cape Colony. His mind, however, was that of the admin-

istrator as distinguished from the statesman, and he was content to settle difficulties as they arose. In 1887 Robinson was induced by Rhodes to give his consent to the conclusion of a treaty with Lobengula which secured British rights in Matabele and Mashona lands. In May 1889 Robinson retired. In his farewell speech he declared that there was no permanent place in South Africa for direct imperial rule. This was interpreted to mean that South Africa must ultimately become independent—an idea repugnant to him. He explained in a letter to *The Times* in 1895 that he had referred to the "direct rule of Downing Street over the Crown colonies, as contrasted with responsible colonial Government." He was made a baronet in 1891.

Early in 1895, when he had entered his 71st year and was not in robust health, he yielded to Lord Rosebery's entreaties, and went out again to South Africa, in succession to Sir H. Loch. The Jameson raid produced a permanent estrangement between him and Cecil Rhodes, and he was out of sympathy with the new colonial secretary, Joseph Chamberlain, who had criticized his appointment, and now desired Robinson to take this opportunity of settling the whole question of the position of the Uitlanders in the Transvaal. Robinson answered that the moment was inopportune, and that he must be left to choose his own time. Alarmed at the imminent danger of war, he confined his efforts to inducing the Johannesburgers to lay down their arms on condition that the raiders' lives were spared, not knowing that these terms had already been granted to Jameson. He came home to confer with the Government, and was raised to the peerage as Baron Rosmead. He returned to South Africa later in the year, but was compelled by ill-health, in April 1897, to quit his post, and died in London on Oct. 28, 1897.

ROSMINI-SERBATI, ANTONIO (1797-1855), Italian philosopher, was born at Rovereto, Italian Tirol, on March 25, 1797. In 1828 he founded a new religious order, the Institute of the Brethren of Charity, known in Italy generally as the Rosminians. The members might be priests or laymen, who devoted themselves to preaching, the education of youth, and works of charity—material, moral and intellectual. They have branches in Italy, England, Ireland, France and America. In London they are attached to the church of St. Etheldreda, Ely Place, Holborn. Rosmini's *The Five Wounds of the Holy Church and The Constitution of Social Justice* were placed (1849) upon the Index. Rosmini at once declared his submission and retired to Stresa on Lago Maggiore, where he died on July 1, 1855. Before his death he had the satisfaction of learning that the works in question were dismissed, that is, proclaimed free from censure by the Congregation of the Index. Twenty years later, the word "dismissed" (*dimittantur*) became the subject of controversy, some maintaining that it amounted to a direct approval, others that it was purely negative and did not imply that the books were free from error. The controversy continued till 1887, when Leo XIII. finally condemned 40 of his propositions and forbade their being taught.

The most comprehensive view of Rosmini's philosophical standpoint is to be found in his *Sistema filosofico*, in which he set forth the conception of a complete encyclopaedia of the human knowable, synthetically conjoined, according to the order of ideas, in a perfectly harmonious whole. Rosmini laid down ideal being as the fundamental principle of all philosophy and the supreme criterion of truth and certainty.

Of his numerous works—collected ed. (17 vols., Milan, 1841-44) supplemented by *Opere postume* (5 vols., Turin, 1859-74)—the most important are the *New Essay on the Origin of Ideas* (Eng. trans., 1833); *The Principles of Moral Science* (1831); *The Restoration of Philosophy in Italy* (1836); *The Philosophy of Right* (1841-45). The following have also been translated into English: *A Catholic Catechism*, by W. S. Agar (1845); *The Five Wounds of the Holy Church* (abridged trans. with introd. by H. P. Liddon, 1883); *Maxims of Christian Perfection*, by W. A. Johnson (1883); *Psychology* (Anonymous) (1884-88); *Sketch of Modern Philosophy*, by Lockhart (1882); *The Ruling Principle of Method Applied to Education*, by Mrs. W. Grey (Boston, Mass., 1887); *Select Letters*, by D. Gazzola. Rosmini's *Sistema filosofico* was translated by Thos. Davidson (*Rosmini's Philosophical System*, 1882, with a biographical sketch and complete bibliography; see also *Lives* by G. S. Macwalter (1883) and G. B. Paganini (1907); C. Werner, *Die italienische Philosophie des 19. Jahrhunderts* (1884); F. K. Kraus, "Antonio Rosmini: sein Leben, seine Schriften," in *Deutsche Rundschau*, liv. iv. (1888);

"Church Reformation in Italy" in the *Edinburgh Review*, cxiv. (July 1861); and numerous recent Italian works, for which Baldwin's *Dictionary of Philosophy* or Pagnani's *Catálogo Generale* (Milan, 1905) should be consulted.

ROSNY, JOSEPH HENRY, a pseudonym covering the collaboration of the French novelists, Joseph Henri Honoré Boëx (1856-1940), and his brother Séraphin Justin François Boëx (1859-1948). The novels of J. H. Rosny are full of scientific knowledge, of astronomy, anthropology, zoology and, above all, sociology. The stories are approached from the point of view of society rather than of the individual, but the characters, strongly individualized and intensely real, are only incidentally typical. The elder Rosny was the sole author of the earlier novels, and began novel-writing as an avowed disciple of Zola. Among these earlier works may be mentioned *Le Bilatéral* (1886), and the "prehistoric" novel, *Vamirek* (1891), a masterpiece of its kind. MM. Rosny were among the writers who in 1887 entered a formal protest in the *Figaro* against Zola's *La Terre*, and they were designated by Edmond de Goncourt as original members of his academy. Among their other novels the more famous are: *Daniel Valgraine* (1891); *L'Indompté* (1895), the history of a girl medical student in Paris; *Le Serment* (1896, dramatized 1897); *Les Ames perdues* (1899), an anarchist novel; *La Charpente* (1900); *Thérèse Degaudy* (1902); *Le Crime du docteur* (1903); *Le Docteur Harambur* (1904); *Le Millionnaire* (1905); *Sous le jardaun* (1906); *La Guerre de feu* (1911) and *La Carapace* (1914).

ROSS, BETSY (1752-1836), heroine of one of the most picturesque legends which has grown up around the origin of the American flag, was born in Philadelphia, Pa., on Jan. 1, 1752. She married John Ross, whose uncle, George Ross, was one of the signers of the Declaration of Independence.

The versions of the flag story as told by her descendants, agree in the following main points: Washington, accompanied by Robert Morris and Gen. George Ross, called at the little upholstery shop in Arch street, where she was carrying on the business in which she and her husband had been engaged, and asked if she could make a flag. She said she never had made one, but that she could try. They thereupon produced a design, rather roughly drawn. She examined it and, noticing that the stars were six-pointed, suggested that they should be made with five points. The gentlemen agreed with her that five points would look better, but that the six-pointed stars would be easier to make. She then showed them how a five-pointed star could be made with a single clip of the scissors. Washington then and there changed the sketch and the three gentlemen left. Soon after a new design was sent to her, coloured by William Barrett, a painter of some note. She thereupon set to work to make the famous flag, which was soon completed and approved.

This story was first presented by William J. Canby, grandson of Betsy Ross, in a paper read in 1870 before the Historical Society of Pennsylvania, and it was verified by other descendants of the family who remembered the story as frequently told to them. No contemporary documentary evidence has ever been found to support the story, nor has any, on the other hand, been found which gives the honour to anyone else. All that has been verified is that there was a Mrs. Ross living in Philadelphia at the time of the flag's adoption, and that she was an upholsterer and flagmaker by trade. She died at Philadelphia on Jan. 30, 1836.

Canby's claims are ably supported by L. Balderston in *The Evolution of the American Flag* (1907). See also P. D. Harrison, *The Stars and Stripes* (1914); G. H. Preble, *Origin and History of the American Flag* (new ed., 1917); S. Abbott, *Dramatic Story of Old Glory* (1919).

ROSS, SIR JAMES CLARK (1800-1862), British rear-admiral and Polar explorer, was born in London on April 15, 1800. He entered the navy in 1812 accompanying his uncle, Captain (afterwards Sir) John Ross, on his first Arctic voyage in search of a North-West passage (1818). Between 1819 and 1827 he made four Arctic expeditions under Parry, and in 1829-33 again under his uncle, and determined (1831) the position of the North Magnetic Pole. In 1834 he was promoted captain, and in 1835-38 worked on the magnetic survey of Great Britain. In 1839-43 he

commanded the Antarctic expedition of the "Erebus" and "Terror." (See ANTARCTIC REGIONS.) He wrote *A Voyage of Discovery and Research to Southern and Antarctic Regions* (1847). He was elected to the Royal Society in 1848, and was captain of the "Enterprise," in the first Franklin search expedition. He died at Aylesbury on April 3, 1862.

ROSS, JANET ANNE (1842-1927), English writer, daughter of Sir Alexander Cornwell Duff Gordon, was born in London on Feb. 24, 1842. She is the original of Rose Jocelyn in Meredith's *Evan Harrington*. She married in 1860 Henry Ross, a banker in Egypt and a great traveller, and her life in Egypt, where she spent six years, is described very vividly in her *Fourth Generation: Reminiscences* (1912). From 1863 to 1867 she was a correspondent of *The Times*. In 1867 she and her husband settled in Italy, where her house was a centre for the lovers of Italian culture. She died in Florence on Aug. 23, 1927. Her publications include: *Three Generations of English Women* (2 vols., 1888); *The Land of Manfred* (1889); *Old Florence and Modern Tuscany* (1904); *Lives of the Early Medici* (1910); *Letters of Principal J. M. Lindsay to Janet Ross* (1922).

ROSS, SIR JOHN (1777-1856), British rear-admiral and Arctic explorer, son of the Rev. Andrew Ross, entered the Royal Navy in 1786. In 1808 he captained the Swedish Fleet, and in 1812 was promoted commander. In 1818 he commanded an Arctic expedition fitted out by the Admiralty, but failed to discover much that was new; but in 1829-33 he made a second Arctic expedition, which achieved important geographical and scientific results. In 1850 he undertook a third voyage in search of Sir John Franklin, and in the following year he attained flag-rank.

His publications include—*Voyage of Discovery for the Purpose of Exploring Baffin's Bay* (1819); *Narrative of a Second Voyage in Search of a North-West Passage, including the Discovery of the North Magnetic Pole* (1835); *Memoirs and Correspondence of Lord De Soumeas* (1838).

ROSS, JOHN, or KOOSKOOWE (1790-1866), chief of the Cherokee Indian nation, was of Scottish-Indian descent, born among the Cherokees in Georgia in 1790. He was principal chief from 1828 until his death. In 1830-31 he applied to the Supreme Court of the U.S. for an injunction restraining the State of Georgia from executing its laws within the Cherokee territory, but the court dismissed his suit on the ground that it had no jurisdiction. A small party among the Cherokees under the leadership of John Ridge, a subchief, were disposed to treat with the U.S. for the removal of their nation west of the Mississippi, and in Feb. 1835, while Ridge was negotiating at Washington, Ross proposed to cede the Cherokee lands to the U.S. for \$20,000,000. The U.S. Senate resolved that \$5,000,000 was sufficient. Both the Ridge treaty and the \$5,000,000 proposal were rejected in a full council of the Cherokees Oct. 1835. The council authorized Ross to renew negotiations, but before leaving for Washington he was arrested by the Georgia authorities on the ground that he was a white man residing in the Indian country contrary to law. He was soon released, but in December of this year a few hundred Cherokees concluded a treaty of removal with the U.S. Indian commissioner at New Echota. When Ross learned this he called a council in Feb. 1836, and at this meeting the treaty was declared null and void and a protest against the proceedings at New Echota was signed by more than 12,000 Cherokees. Notwithstanding Ross's opposition, the Senate in the following May ratified the treaty and in Dec. 1838, Ross, with the last party of Cherokees, left for the West (See GEORGIA). During the Civil War, Ross signed a treaty with the Confederate States in Oct. 1861, but in the summer of 1862 was forced by Union sympathizers in the nation) to proclaim neutrality and soon afterwards went over to the Union lines. He was in Washington treating with the Federal Government in Feb. 1863 when the treaty with the Confederate States was abrogated by the Cherokees. He died at Washington on Aug. 1, 1866.

See C. C. Royce, "The Cherokee Nation of Indians" in the *Fifth Annual Report of the Bureau of Ethnology* (1887), and T. V. Parker, *The Cherokee Indians* (New York, 1907).

ROSS, SIR RONALD (1857-1932), British physician and bacteriologist, was born at Almora, India, on May 13, 1857. He

studied medicine at St. Bartholomew's hospital, London, and in 1881 entered the Indian medical service. In 1892 he commenced a series of special investigations on the subject of malaria, in 1895 undertook the experimental verification of the theory that the micro-organisms of this disease are spread by mosquitoes, and in 1897-98 investigated the life history of the parasites. In 1899 he retired from the Indian medical service, and, after a journey to west Africa in 1899 for the study of malaria-bearing mosquitoes, devoted himself to research and teaching, joining the Liverpool school of tropical medicine as lecturer and subsequently becoming professor of tropical medicine at Liverpool university. In 1913 he became physician for tropical disease at King's college, London, and later, director-in-chief of the Ross Institute and Hospital for Tropical Diseases. During World War I, Ross was appointed to the R.A.M.C. and became War Office consultant in malaria. After the War he was consultant in malaria for the Ministry of Pensions. In 1902 he received the Nobel Prize for medicine, in 1911 a K.C.B. and in 1918 a K.C.M.G. He received the Royal Medal of the Royal Society, of which he was a fellow, in 1901. He was editor of *Science Progress*, and his other publications include *The Prevention of Malaria* (1910), *Philosophies* (1910), *Psychologies* (1919), *The Revels of Orsera*, a romance (1920), and *Memoirs* (1923), as well as mathematical and medical works. (See MALARIA.) Ross died Sept. 16, 1932.

ROSS (ROSS-ON-WYE), a market town and urban district in Herefordshire, England; 133 mi. W. from London and 12 mi. S.E. from Hereford by the G.W.R. Pop. (1938) 4,607. Area, 1.6 sq. mi. There are manufactures of machinery and agricultural implements, and cider and malt are produced. The church of St. Mary the Virgin, surmounted by a lofty spire, shows good Decorated and Perpendicular work. The market house (1670) is a picturesque building supported on columns, the upper portion serving as a town hall. The town owes much to John Kyrie (d. 1744), eulogized by Pope (*Moral Epistle*, 1732). Wilton castle, near the town, was burned by the Royalists during the Civil War. The inhabited portion is modern. Ross was granted to the see of Hereford by Edmund Ironside, but became crown property in 1559.

ROSS AND CROMARTY, northern county, Scotland. The mainland portion is bounded north by Sutherland and Dornoch firth, east by the North sea and Moray firth, south by Beaulieu firth and Inverness-shire and west by the strait of the Minch. The island portion (for details see HEBRIDES) consists of the northern part of Lewis-with-Harris, and many smaller islands, all but eleven uninhabited, are scattered principally off the west coasts of Lewis and the mainland. The land area of the mainland is 1,572,294 ac., of the islands 404,413 ac., a total of 1,977,248 ac. or 3,089.5 sq. mi. The inhabited islands belonging to the mainland are all situated off the west coast. They are Bernera, Gilleean (lighthouse), Horrisdale, Dry, Ewe, Martin and Flannan (lighthouse). On the North sea front the chief indentations are Beaulieu firth and Inner Moray firth, marking off the Black Isle from Inverness-shire; Cromarty firth, bounding the districts of Easter Ross and the Black Isle; Moray firth, separating Easter Ross from Nairnshire; and Dornoch firth, dividing northeast Ross from Sutherlandshire. On the Atlantic face, the principal sea lochs and bays, from S. to N., are Loch Duich, Loch Alsh, Loch Carron, Loch Kishorn, Loch Torridon, Loch Shieldaig, Upper Loch Torridon, Gairloch, Loch Ewe, Gruinard bay, Little Loch Broom and Enard bay. Almost all the southern boundary with Inverness-shire is guarded by a rampart of peaks, ranging from 3,400 to nearly 3,900 ft. To the north of Glen Torridon rise the masses of the Liatach, with summits of 3,456 and 3,358 ft. On the northeastern shore of Loch Maree rises Ben Slioch (3,217), while the Fannich group contains at least six peaks of more than 3,000 ft. The isolated mass of Ben Wyvis (3,440) is the most noteworthy feature in the northeast, and the Chalach hills in the northwest with peaks of 3,483 and 3,474 ft. are equally conspicuous, though less solitary. Only a small fraction of western and southern Ross is under 1,000 ft. in height. Easter Ross and the peninsula of the Black Isle are comparatively level. The longest stream is the Orrin, which rises in An Sithian and flows mainly east by north to its confluence with the Canon after a run of about 26 mi. during

a small part of which it forms the boundary with Inverness-shire. At Aultgowrie the stream forms the falls of Orrin in a narrow gorge. From its source in the mountains in Strathvaich the Black-water flows southeast for 19 mi. until it joins the Conon, forming soon after it leaves Loch Garve the picturesque falls of Rogie. Within a short distance of its exit from Loch Luichart the Conon pours over a series of graceful cascades and rapids and then pursues a winding course of 12 mi., mainly E. to the head of Cromarty firth. The falls of Glomach, in the southwest, are the deepest in Britain (370 ft. sheer). Twelve miles south by east of Ullapool are the three falls of Measach, close to the gorge of Corrieallach. The Oykel, throughout its course, forms the boundary with Sutherlandshire, to which it properly belongs. The largest and most beautiful of the many fresh-water lakes is Loch Maree (q.v.). Of the straths or valleys the more important run from the centre eastward, such as Strathconon (12 mi.), Strathbran (10 mi.), Strathgarve (8 mi.), Strathpeffer (6 mi.) and Strathcarron (14 mi.). Excepting Glen Orrin (13 mi.), in the east central district, the longer glens lie in the south and toward the west. In the extreme south Glen Shiel (9 mi.) runs between fine mountains to its mouth on Loch Duich. General Wade's road passes down the glen. Farther north are Glen Elchaig (9 mi.), Glen Carron (12 mi.), in the latter of which the track of the Dingwall and Skye railway is laid, and Glen Torridon (6 mi.).

Geology.—The central portion of the county is occupied by the younger highland schists or Dalriadan series. On the eastern side of the county the Dalriadan schists are covered unconformably by the Old Red Sandstone. The western boundary of the younger schist is formed by the great pre-Cambrian dislocation line which traverses the county from Elphin on the north by Ullapool to Glen Carron. Most of the area west of the line of disturbance is covered by Torridonian Sandstone, mainly dark reddish sandstones, grits and shales, resting unconformably on the ancient Lewisian gneiss. Within the Torridonian tract the gneiss occupies large areas north of Colgach, on the east of Enard bay, between Gruinard bay and Loch Maree. The Lewisian gneiss is everywhere penetrated by basic dikes, generally with a N.W.-S.E. direction; some of these are of great breadth. The Torridonian rocks are succeeded unconformably by a series of Cambrian strata which is confined to a narrow belt west of the line of main thrusting. Glacial striae are found upon the mountains up to heights of 3,000 ft., and much boulder clay is found in the valleys and spread over large areas in the eastern districts. Raised beaches occur at 100, 50 and 25 ft. above the present sea level; they are well seen in Loch Carron. (See, further, *HEBRIDES*.)

Agriculture and Industries.—The most fertile tracts lie on the eastern coast, especially in Easter Ross and the Black Isle, where the soil varies from a light sandy gravel to a rich deep loam. Among grain crops, oats is that most generally cultivated, and occupied 28,946 ac. in 1938, but barley and wheat are also raised, though together they occupied only 6,214 ac. Turnips and swedes, and potatoes are the chief green crops, the former, at 11,334 ac., having more than twice the acreage of the latter. On the higher grounds there is a large extent of good pasture which carries heavy flocks of sheep (355,979 animals in 1938), Black-faced being the principal breed. Most of the horses are maintained for the purposes of agriculture. The herds of cattle, mainly native Highland or crosses, are large. Owing partly to the unkindly nature of the bulk of the surface—which offers no opportunity for other than patchwork tillage—the number of small holdings is enormous, 56% of the 7,295 in 1938 being of 5 ac. and less, and the average size 1½ ac. More than 800,000 ac. is devoted to deer forests, a greater area than in any other county in Scotland. The natural woodland has largely disappeared, but afforestation has been undertaken. Apart from agriculture, the salmon fisheries in the bays and river mouths, and the herring, cod and ling fisheries are the only considerable industry. There are distilleries near Dingwall, Tain and Invergordon.

The L.M.S. railway entering the county to the north of Beaulieu runs northward to Dingwall, and then strikes off to the northeast by Invergordon and Tain, where it bends to the west by north, leaving the shire at Culrain, having largely followed the coast

throughout. At Muir of Ord it sends off the Black Isle branch and at Dingwall a branch to Strathpeffer, as well as a line to Stromie Ferry and Kyle of Loch Alsh on the southwestern shore.

Population and Administration.—Pop. (est. 1938) 62,846. In 1931 there were 37,534 on the mainland and 25,265 on the islands. Ross and Cromarty, though the third largest in size, is the fourteenth county in population. In 1931 there were 3,333 who spoke Gaelic only and 31,058 speaking Gaelic and English. Of the six small burghs, the chief are Stornoway (est. 1938 pop., 4,557), Dingwall (2,828), Invergordon (1,490) and Tain (1,421). Ullapool is a fishing port near the mouth of Loch Broom. There are 12 county districts and the county returns one of the Inverness members to parliament. Dingwall, Tain and Fortrose are royal burghs, and Dingwall is the county town. Ross and Cromarty forms a sheriffdom, and there are resident sheriffs-substitute at Dingwall and Stornoway, the former also sitting at Tain and Cromarty.

The shire is under school board control and there are academies at Dingwall and Fortrose.

History and Antiquities.—It may be doubted whether the Romans ever effected even a temporary settlement in the area of the modern county. At that period, and for long afterward, the land was occupied by Gaelic Picts, who, in the 6th and 7th centuries, were converted to Christianity by followers of St. Columba. Throughout the next three centuries the natives were continually harassed by Norse pirates, of whose presence tokens have survived in several place names (Dingwall, Tain, etc.). At this time the county formed part of the great province of Moray. When the rule of the Celtic *normans* or earls ceased in the 12th century, consequent on the plantation of the district with settlers from other parts (including a body of Flemings), by order of David I, who was anxious to break the power of the Celts, the bounds of Moravia were contracted and the earldom of Ross arose. At first Ross proper only included the territory adjoining Moray and Dornoch firths. The first earl was Malcolm MacHeth, who received the title from Malcolm IV. After his rebellion in 1179 chronic insurrection ensued, which was quelled by Alexander II, who bestowed the earldom on Farquhar Macintaggart, then abbot of Applecross, and in that capacity lord of the western district. William, 4th earl, was present with his clan at the battle of Bannockburn (1314), and almost a century later (1412) the castle of Dingwall, the chief seat on the mainland of Donald, lord of the Isles, was captured after the disastrous fight at Harlaw in Aberdeenshire, which Donald had provoked when his claim to the earldom was rejected. The earldom reverted to the crown in 1424, but James I soon afterward restored it to the heiress of the line, the mother of Alexander MacDonald, 3rd lord of the Isles, who thus became 11th earl. In consequence, however, of the treason of John MacDonald, 4th and last lord of the Isles and 12th earl of Ross, the earldom was again vested in the crown (1476). Five years later James III bestowed it on his second son, James Stewart, whom he also created duke of Ross in 1488. By the 16th century the whole area of the county was occupied by different clans, the Rosses, Munroes, Macleods, Macdonalds and Mackenzies. The county of Ross was constituted in 1661, and Cromarty in 1685 and 1693, both being consolidated into the present county in 1880. (See *CROMARTY*.) Apart from occasional conflicts between rival clans, the only battles in the shire were those of Invercarron (1650), when Montrose was crushed by Colonel Strachan, and Glenshiel (1719), when the Jacobites, under the earl of Seaforth, aided by Spaniards, were defeated, near Bridge of Shiel, by General Wightman.

Stone circles, cairns and forts are found in the eastern district. A vitrified fort crowns the hill of Knockfarrel in the parish of Fodderty, and there is a circular dun near the village of Lochcarron. Some fine examples of sculptured stones occur, the finest being at Sandwick. Among old castles are those of Lochsail, in the parish of Fearn, said to date from the 13th century, which, though ruinous, possesses two square towers in good preservation; Balone, in the parish of Tarbat, once a stronghold of the earls of Ross; the remains of Dingwall castle, their original seat; and Eilean Donain in Loch Alsh, which was blown up by English war-

ships during the abortive Jacobite rising in 1719.

ROSSANO, a city of Calabria, Italy, in the province of Cosenza, 24 mi. N.N.E. from that town direct, with a station 4 mi. distant on the line from Metaponto to Reggio. Pop. (1936) 8,763 (town), 15,393 (commune). It is on a spur of Sila mountain, overlooking the Gulf of Taranto, the highest part of the town being 975 ft. above sea-level. Rossano is the seat of an archbishop, and in the cathedral is preserved the *Codex Rossanensis*, an uncial ms. of the Gospels of Matthew and Mark in silver characters on purple vellum, with twelve miniatures, of great interest in the history of Byzantine art, belonging to the 6th century A.D.

Rossano (*Rosiclanum*) was one of the important fortresses of Calabria. Totila took it in 548. In the 14th century Rossano was made a principality for the great family of De Baux. Passing to the Sforza, and thus to Sigismund of Poland, it was united in 1558 to the crown of Naples by Philip II. of Spain. During World War II it was bombed by the Allies.

ROSSBACH, a village in the Land of Saxony, Germany, in the district of Merseburg, 8 mi. S.W. of that place and N.W. of Weissenfels, famous as the scene of Frederick the Great's victory over the allied French and the army of the Empire on Nov. 5, 1757. For the preceding events see SEVEN YEARS' WAR. The Prussian camp on the morning of the 5th lay between Rossbach (left) and Bedra (right), facing the Allies, who, commanded by the French general, Charles de Roban, prince de Soubise, and Joseph Frederick William, duke of Saxe-Hildburghausen, General Feldzeugmeister of the Empire, had manoeuvred in the preceding days without giving Frederick an opportunity to bring them to action, and now lay to the westward, with their right near Branderoth and their left at Mücheln (see sketch). The advanced posts of the Prussians were in the villages immediately west of their camp, those of the Allies on the Schortau hill and the Galgenberg.

The Allies possessed a numerical superiority of two to one in the battle itself, irrespective of detachments, and their advanced post overlooked all parts of Frederick's camp. They had had the best of it in the manoeuvres of the previous days, and Hildburghausen determined to take the offensive. He had some difficulty, however, in inducing Soubise to risk a battle, and the Allies did not begin to move off their camping-ground until after eleven on the 5th, Soubise's intention being probably to engage as late in the day as possible, with the idea of gaining what advantages he could in a partial action. The plan was to march the Allied army by Zeuchfeld, round Frederick's left (which was covered by no serious natural obstacle), and to deploy in battle array, facing north, between Reichardtswerben (right) and Pettstädt (left). The duke's proposed battle and the more limited aim of Soubise were equally likely to be attained by taking this position, which threatened to cut off Frederick from the towns on the Saale. This position, equally, could only be gained by marching round the Prussian flank, i.e., by a flank march before the enemy. The obvious risk of interference on the exposed flank was provided against by a considerable flank guard, and in fact it was not in the execution of their original design but in hastily modifying it to suit unfounded assumptions that the Allies met with disaster.

Frederick spent the morning watching them from a house-top in Rossbach. The initial stages of their movement convinced him that the Allies were retreating southward towards their magazines, and about noon he went to dinner, leaving Captain von Gaudi on the watch. This officer formed a different impression of the Allies' intentions, for the columns which from time to time became visible in the undulations of the ground were seen to turn eastwards from Zeuchfeld. Gaudi's excited report at first served only to confirm Frederick in his error. But when the king saw for himself that hostile cavalry and infantry were already near Pettstädt, he realized the enemy's intentions. The battle for which he had manoeuvred in vain was offered to him, and he took it without

hesitation. Leaving a handful of light troops to oppose the French advanced post (or flank guard) on the Schortau hill, the Prussian army broke camp and moved—half an hour after the king gave the order—to attack the enemy. The latter were marching in the normal order in two main columns, the first line on the left, the second line on the right; farther to the right was a column consisting of the reserve of foot, and between the first and second lines

was the reserve artillery on the road. The right-wing cavalry was of course at the head, the left-wing cavalry at the tail of the two main columns. At first the regulation distances were preserved, but when wheeling eastward at Zeuchfeld there was much confusion, part of the reserve infantry getting in between the two main columns and hampering the movements of the reserve artillery, and the rest, on the outer flank of the wheel, being unable to keep up with the over-rapid movement of the wheeling pivot. A weak flank guard was thrown out towards Rossbach. When it was seen that the Prussians were moving, as far as could be judged, eastward, it was presumed that they were about to retreat in order to avoid being taken in flank and rear; and the Allied generals thereupon hurried the march, sending the cavalry on ahead.

Frederick had no intention either of forming up parallel to the enemy or of retreating. As his army could move as a unit twice as fast as the enemy's, he intended to make a détour, screened by the Janus Hügel and the Pölzen Hügel, and to fall upon them suddenly from the east. If at the moment of contact the Allies had already formed their line of battle facing north, the attack would strike their right flank; if they were still on the move in column eastwards or north-eastwards, the heads of their columns would be crushed before the rest could deploy in the new direction—deployment in those days being a lengthy affair. To this end General von Seydlitz, with every available squadron, hurried eastward from Rossbach, behind the Janus Hügel, to the Pölzen Hügel; Colonel von Moller, with eighteen heavy guns, came into action on the Janus Hügel at 3.15 against the advancing columns of the Allied cavalry; and the infantry followed as fast as possible. When they came under the fire of Moller's guns, the Allied squadrons, which were now north of Reichardtswerben and well ahead of their own infantry, suffered somewhat heavily; but it was usual to employ heavy guns to protect a retreat, and they contented themselves with bringing some field-guns into action. They were, however, amazed when Seydlitz's thirty-eight squadrons suddenly rode down upon the head and right flank of their columns from the Pölzen Hügel "avec une incroyable vitesse." Gallantly as the leading German regiments deployed to meet him,

¹V. der Goltz (*Rosbach bis Jena*, 1906 edition) gives 41,000 Allies and 21,600 Prussians as the combatant strengths. Berndt's statistical work, *Zach im Kriege*, gives the respective forces engaged as Allies 43,000, Prussians 21,000. Other accounts give the Allies' total strength as 64,000 and the Prussians' as 24,000.

the result was scarcely in doubt for a moment. Seydlitz threw in his last squadron, and then himself fought like a trooper, receiving a severe wound. The mêlée drifted rapidly southward, past the Allied infantry, and Seydlitz finally rallied his horsemen in a hollow near Tagewerben, ready for fresh service. This first episode was over in half an hour, and by that time the Prussian infantry, in échelon from the left, was descending the Janus Hügel to meet the already confused and disheartened infantry of the Allies. The latter, as their cavalry had done, managed to deploy some regiments on the head of the column, and the French in particular formed one or two columns of attack—then peculiar to the French army—and rushed forward with the bayonet. But Moller's guns, which had advanced with the infantry, tore gaps in the close masses, and, when it arrived within effective musketry range, the attack died out before the rapid and methodical volleys of the Prussian line. Meanwhile the Allies were trying in vain to form a line of battle. The two main columns had got too close together in the advance from Pettstätt, part of the reserve which had become entangled between the main columns was extricating itself by degrees and endeavouring to catch up with the rest of the reserve column away to the right, and the reserve artillery was useless in the middle of the infantry. The Prussian infantry was still in échelon from the left, and the leftmost battalions that had repulsed the French columns were quickly within musket-shot of this helpless mass. A few volleys directed against the head and left flank of the column sufficed to create disorder, and then from the Tagewerben hollow Seydlitz's rallied squadrons charged, wholly unexpectedly, upon its right flank. The Allied infantry thereupon broke and fled. Soubsie and the duke, who was wounded, succeeded in keeping one or two regiments together, but the rest scattered over the countryside. The battle had lasted less than an hour and a half, and the last episode of the infantry fight no more than fifteen minutes. Seven Prussian battalions only were engaged, and these expended five to fifteen rounds per man. Seydlitz and Prince Henry of Prussia, the cavalry and the infantry leaders engaged, were both wounded, but the total loss of the king's army was under 550 officers and men as compared with 7,000 on the part of the Allies. (C. F. A.)

ROSSE, WILLIAM PARSONS, 3RD EARL OF (1800-1867), Irish astronomer and telescope constructor, was born at York on June 17, 1800, a son of the 2nd earl, Lawrence. Until his father's death he was known as Lord Osmantown. Entered at Trinity college, Dublin, in 1818, he proceeded to Magdalen college, Oxford, in 1821, and in the same year he was returned as M.P. for King's County, a seat which he resigned in 1834. He was Irish representative peer from 1845, president of the British Association in 1843, president of the Royal Society from 1849 to 1854, being awarded the Royal Medal in 1851, and chancellor of the University of Dublin from 1862. He died at Monkstown on Oct. 31, 1867.

The first constructor of reflecting telescopes on a large scale, William Herschel, never published anything about his methods of casting and polishing specula, and Lord Rosse had no help towards his brilliant results. His speculum metal is composed of four atoms of copper (1264 parts) and one of tin (58.9 parts), a brilliant alloy. Chiefly owing to the brittleness of this material, Lord Rosse's first larger specula were composed of a number of thin plates of speculum metal (16 for a 3-foot mirror) soldered on the back of a strong but light framework made of a brass (2.75 of copper to 1 of zinc), which has the same expansion as his speculum metal. In Brewster's *Edinburgh Journal of Science* for 1828 he described his machine for polishing the speculum, which in all essential points remained unaltered afterwards. In Sept. 1839 a 3-foot speculum was finished and mounted, but, though the definition of the images was good, its skeleton form allowed the speculum to follow atmospheric changes of temperature very quickly, so Lord Rosse decided to cast a solid 3-foot speculum. Hitherto a great difficulty in casting specula was the fact that they generally cracked while cooling. Rosse experimented, ingeniously overcame this difficulty, and successfully cast a solid 3-foot speculum in 1840. In 1842 he began a speculum of 6 ft. diameter, and in 1845 this great reflector was

mounted and ready for work.

From 1848 to 1878 it was but with few interruptions employed for observations of nebulae (see NEBULA); and many previously unknown features in these objects were revealed by it, especially the similarity of "annular" and "planetary" nebulae, and the remarkable "spiral" configuration in many of the nebulae. A special study was made of the nebula of Orion, and the resulting large drawing gives an extremely good representation of this complicated object. (See TELESCOPE.)

See Ball, *Great Astronomers* (London, 1895).

ROSSELLINO, ANTONIO (1427-c. 1479), Florentine sculptor, was the son of Matteo Gamberelli, and had four brothers. The Gamberelli were a family of stonemasons of Settignano. Antonio's works are full of religious sentiment, and executed with the utmost delicacy of touch and technical skill. The style of Antonio and his brother Bernardo is a development of that of Donatello and Ghiberti; it possesses all the refinement and sweetness of the earlier masters, but is not equal to them in vigour or originality. Antonio's chief work, still in perfect preservation, is the lovely tomb of a young cardinal prince of Portugal, who died in 1459. It occupies one side of a small chapel, also built by Rossellino, on the north of the nave of San Miniato al Monte. The recumbent effigy of the cardinal rests on a handsome sarcophagus, and over it, under the arch which frames the whole, is a beautiful relief of the Madonna between two flying angels. The tomb was begun in 1461 and finished in 1466.

ROSSELLINO, BERNARDO (1409-1464), sculptor, the eldest brother of Antonio. In Sept. 1439 he acquired a house in the Via Proconsolo, Florence, and opened a bottega with his four brothers. His finest piece of sculpture is the tomb, in the Florentine Santa Croce, of Leonardo Bruni of Arezzo, the historian of Florence, executed in 1443. In the church of S. Stefano at Empoli is an annunciation dated 1447. The tomb of Beata Villana at S. Maria Novella, Florence, was ordered in 1451. Bernardo's works as an architect were numerous and important. He was probably associated with Alberti in the construction of the Rucellai palace, Florence, and in extensive restorations and reconstructions of churches under Nicholas V. in Rome. Between the years 1461 and 1464 (when he died while engaged on the Lazzari monument at Pistoia) he occupied the important post of *capo-mastro* to the Florentine duomo.

See Wilhelm Bode, *Die Italienische Plastik* (1902).

ROSSETTI, CHRISTINA GEORGINA (1830-1894), English poet, was the youngest of the four children of Gabriele Rossetti. (See article on her brother DANTE GABRIEL ROSSETTI.) She was born at 38 Charlotte Street, Portland Place, London, on Dec. 5, 1830. She enjoyed the advantages and disadvantages of the strange society of Italian exiles and English eccentrics which her father gathered about him, and she shared the studies of her gifted elder brother and sister. As early as 1847 her grandfather, Gaetano Polidori, printed privately a volume of her *Verses*, in which the richness of her vision was already faintly prefigured. In 1850 she contributed to *The Germ* seven pieces, including some of the finest of her lyrics. In her girlhood she had a grave, religious beauty of feature, and sat as a model not only to her brother Gabriel, but to Holman Hunt, to Madox Brown and to Millais. In 1853-54 Christina Rossetti for nearly a year helped her mother to keep a day-school at Frome-Selwood, in Somerset. Early in 1854 the Rossettis returned to London, and the father died.

In poverty, in ill-health, in extreme quietness, she was now performing her life-work. She was twice sought in marriage, but each time, from religious scruples (she was a strong high-church Anglican), she refused her suitor; on the former of these occasions she sorrowed greatly, and her suffering is reflected in much of her early song. In 1861 she saw foreign countries for the first time, paying a six weeks' visit to Normandy and Paris. In 1862 she published what was practically her earliest book, *Goblin Market*, and took her place at once among the poets of her age. In this volume, indeed, is still to be found a majority of her finest writings. *The Prince's Progress* followed in 1866. In 1867 she, with her family, moved to 56 Euston Square, which became their home for many years. Christina's prose work *Commonplace*

appeared in 1870. In April 1871 her whole life was changed by a terrible affliction, known as "Graves's disease"; for two years her life was in constant danger. She had already composed her book of children's poems, entitled *Sing-Song*, which appeared in 1872.

After a long convalescence, she published in 1874 two works of minor importance, *Anus Domini* and *Speaking Likenesses*. The former is the earliest of a series of theological works in prose, of which the second was *Seek and Find* in 1879. In 1881 she published a third collection of poems, *A Pageant*, in which there was evidence of slackening lyrical power. She now gave herself almost entirely to religious disquisition. The most interesting and personal of her prose publications (but it contained verse also) was *Time Flies* (1885)—a sort of symbolic diary or collection of brief homilies. In 1890 the S.P.C.K. published a volume of her religious verse. She collected her poetical writings in 1891. In 1892 she was led to publish a very bulky commentary on the Apocalypse, entitled *The Face of the Deep*. After this she wrote little. Her last years were spent in retirement at 30 Torrington Square, Bloomsbury, where she was her home from 1876 to her death. In 1892 her health broke down finally, and she had to endure terrible suffering. From this she was released on Dec. 29, 1894. Her *New Poems* were published posthumously in 1896.

In spite of her manifest limitations of sympathy and experience, Christina Rossetti takes rank among the foremost poets of her time. In the purity and solidity of her finest lyrics, the glow and music in which she robes her moods of melancholy reverie, her extraordinary mixture of austerity with sweetness and of sanctity of tone with sensuousness of colour, Christina Rossetti, in her best pieces, may challenge comparison with the most admirable of our poets. The union of fixed religious faith with a hold upon physical beauty and the richer parts of nature has been pointed to as the most original feature of her poetry. Hers was a cloistered spirit, timid, nun-like, bowed down by suffering and humility; her character was so retiring as to be almost invisible. All that we really need to know about her, save that she was a great saint, was that she was a great poet. (E. G.)

See the *Poetical Works of C.B.R.* with Memoir by W. M. Rossetti (1893); Edmund Gosse, *Critical Kit-Kats* (1896); an article by Ford Madox Hueffer in the *Fortnightly Review* (March, 1904); and another in *The Christian Science* (Oct. 1904). The *Family Letters of Christina Rossetti* were edited by W. M. Rossetti in 1908; *Selected Poems of Christina C. Rossetti*, edited by C. B. Burke (1913); T. Watts-Dunton, *Old Familiar Faces* (1916); Marjorie A. Bald, *Women Writers of the Nineteenth Century* (1923).

ROSSETTI, DANTE GABRIEL (1828-1882), English poet and painter, was born on May 12, 1828, at 38 Charlotte Street, London. He was the second of the four children of Gabriele Rossetti (1783-1854), Italian poet and liberal, a political refugee from Naples, who came to England about 1824, and married in 1826 Frances Mary (d. 1886), sister of Byron's physician, Dr. John Polidori. The elder Rossetti became professor of Italian at King's College, London, and was a subtle and original, if eccentric, commentator on Dante. His other children were Maria Francesca (1827-76), who eventually entered an Anglican sisterhood, and is known to scholars by her valuable *Shadow of Dante*; William Michael (*q.v.*); and Christina (*q.v.*) the poet.

Dante Gabriel Rossetti was educated at King's College School, London. On leaving school he went (1843) to Cary's Art academy (known as Sass's), near Bedford Square, and then (about 1846) to the Royal Academy Antique school. He did not find the instruction he desired in the Royal Academy schools, and asked Ford Madox Brown to take him as a pupil. Brown remained his friend even after Rossetti had transferred his admiration to Holman Hunt.

Pre-Raphaelite Brotherhood.—The point of Pre-Raphaelite crystallization which had so great though brief an influence upon Rossetti's life and art was found at a chance meeting, in 1848, between Rossetti, Millais and Holman Hunt in Millais's house in Gower Street, where certain prints from early Italian frescoes were studied. Rossetti proposed the formation of a "Brotherhood" with lofty aims, and they were joined by J. Colinton, F. G. Stephens, T. Woolner and W. M. Rossetti. Brown, though invited,

declined to become a P.R.B. Rossetti's first effort was "The Girlhood of Mary, Virgin," which in March 1849 was exhibited at the "Free Exhibition," at Hyde Park Corner. The style of this famous picture was jejune, its handling was timid, while its coloration and tonality were dry, not to say thin. Its technique owed something to Brown, but its mysticism was Rossetti's own. Such was his advent in art under the Pre-Raphaelite banner. "Ecce Ancilla Domini!" the smaller picture which is now in the Tate Gallery, London, was his one perfect expression of the original motive of the "Brotherhood." He chose virginal white and its harmonies as its aptest coloration, and the intense light of morning sufficed for its tonality. There is real grace and sweetness in the figure of the Virgin, for which his sister Christina was the model. This picture was exhibited at the Portland Gallery in 1850 and was violently attacked by the critics at the time.

In December 1850 appeared the first of the four numbers of *The Germ*, the organ of the "Brotherhood," in which Rossetti had a leading place in verse and prose. He contributed to it some of his most famous poems—*The Blessed Damsel*, six sonnets and four lyrics.

The attack on the Pre-Raphaelites by the critics prejudiced their sales, and Rossetti turned to water-colours. His first considerable effort in this medium, which proved well-suited to his talent, was the illustration to Browning's poem "The Laboratory," depicting a lady's visit to an old poison-monger to obtain a fatal potion for her rival in love. This wonderful gem of colour marked the opening of the artist's second period, and his departure from that phase of Pre-Raphaelitism of which "Ecce Ancilla Domini!" was the crowning achievement. Other water-colours followed including the original (pen and ink) of "Hesteria Rosa," a gambling scene (1852), and "Dante drawing the Angel" (1852). "Found" was begun in 1853; but this piece of pictorial moralizing (the analogue of the poet's *Jenny*), vigorous and intensely pathetic as it is, was never really finished.

Marriage to Elizabeth Siddal.—Rossetti had now become acquainted with the beautiful Elizabeth Siddal, whose sumptuous and individual type moved Hunt, Millais and Rossetti to paint her. Rossetti painted her innumerable times, and they became engaged to be married about 1851. The friends called her "Lizzy" and "Guggums," though the names ill suited her tragic temperament and ominous beauty. By 1854 the Brotherhood, championed by John Ruskin, was respectable, but at the moment of success the group was broken up. Ruskin became Rossetti's patron and friend; it was rather a onesided friendship, for Rossetti was not prepared to accept Ruskin's pretensions. In May 1860 Rossetti and Elizabeth Siddal were married, but the two years of their marriage were painful years, for she was dying of tuberculosis. She gave birth to a still-born child, and on Feb. 11, 1862, she died of an overdose of laudanum, which she took from time to time to allay her sufferings. In the meantime Rossetti had met William Morris and Burne-Jones, both of them his enthusiastic disciples. To these new friendships are due Rossetti's part in the luckless decorations of the Oxford Union (1857-8). To the exhibition of the Pre-Raphaelites in 1857 he sent many works, including the "Wedding of St. George and Princess Sabra" and "Arthur's Tomb" (both in the Tate Gallery, London). "Bocca Baciata," the portrait (in oils) of a woman, a work of wonderful fire, and the pictures on the pulpit at Llandaff Cathedral, marked the close of the second epoch in Rossetti's art and the beginning of the third, last and most powerful of all the phases of his career. The picture "Dr. Johnson at the Mitre" (Tate Gallery), when the "pretty fools" consulted the lexicographer on Methodism, is a good example of his humour. In 1861 Rossetti published the exquisite translations in *The Early Italian Poets*, later revised as *Dante and his Circle* (1874).

Achievements in Painting.—With Morris he began to take a keen interest in decorative art. He produced several fine designs for stained glass, and had a large share in the revival of stained-glass painting as an art. The practice of designing on a large scale, and employing masses of splendid deep-toned colours, was probably largely responsible for the development of his powers in painting at this period (1862-63). He produced at this time a

striking and highly imaginative triptych (Tate Gallery), representing three events in the careers of Paolo and Francesca. The composition of the group of figures with the circular window behind them, is as fine as it was comparatively novel in Rossetti's practice. Other outstanding works are "Beata Beatrix" (Elizabeth Siddal as the blessed Beatrice contemplating the eternal) (1865), now in the Tate Gallery; "Proserpina in Hades" (1874), perhaps the most original, if not the most poetical and powerful of all his output; "Sibylla Palmifera" (1870); "Venus Verticordia" (1871); "Lilith," the better of the two versions is now referred to (1873); "Monna Vanna," in the Tate Gallery (1866); "Aurea Catena" (Janey Morris) (c. 1869); "La Ghirlandata" (1878); "Pandora," another study of Mrs. Morris (1871); "The Blessed Damozel" (1877); and the famous "Dante's Dream," now in the Walker Art Gallery at Liverpool. Nearly all Rossetti's last work was exhibited by the Royal Academy and at the Burlington Fine Art Club in 1883, after his death.

Development As a Poet.—The literary side of Rossetti developed *pari passu* with his achievements as a painter. After his wife's death he moved from Blackfriars to 16, Cheyne Walk (The Queen's House), Chelsea, where for a short time A. C. Swinburne, W. M. Rossetti and Theodore Watts-Dunton lived with him. Rossetti had felt his wife's death—and perhaps his own remorse for having so frequently betrayed her—so acutely that in the first paroxysm of his grief he insisted upon his poems (then in manuscript) being buried in her coffin. But in 1869 they were disinterred and published in 1870. The volume contained the poems printed in *The Germ*, the sonnet-sequence *The House of Life*, very much enlarged at a later date. From this time to his death he continued to write poems and produce pictures—in the latter relying more and more upon his manipulative skill and less and less upon his inventive faculty. He depended also to some extent on the assistance of an artist whose name was Treffry Dunn.

In 1871 Robert Buchanan, in an unsigned article in the *Contemporary Review* on "The Fleshly School of Poetry," made a fierce attack on Rossetti's poems from a moral point of view, to which he answered by one on the "Stealthy School of Criticism." The attack was deeply felt by him, and his tendency towards gloomy brooding was further increased about 1868, by persistent insomnia. The result of this malady was a nervous shrinking from personal contact with any save a few intimate friends, which was aggravated by the use of narcotics, and at one time he saw scarcely anyone save his own family and Theodore Watts-Dunton. Fears were felt for his sanity, and in 1872 he was under medical care. He was frequently away with William Morris at Kelmscott, in Oxfordshire; indeed he was for some time (1872-74) a co-tenant of Kelmscott. This friendship was broken by the disputes arising out of the reorganization of the Morris firm, but Mrs. Morris was still an occasional visitor at Cheyne Walk.

While his *Ballads and Sonnets* was being printed (1881) his health began to give way and he died on April 9, 1882. His *Ballads and Sonnets* contained much of his best work, including the completed *House of Life*, and the fine ballads, *Rose Mary*, *The White Ship*, and *The King's Tragedy*.

ROSSETTI, WILLIAM MICHAEL (1829-1919), English author and critic, born in London, second son of Gabriele and Frances Rossetti. In 1845, owing to pressure of family circumstances, he entered the Excise Office, afterwards the Inland

Revenue Office, where he remained till 1894, retiring with the rank of under-secretary. He was a founder of the Pre-Raphaelite Brotherhood, and edited its organ *The Germ*, to which he contributed several papers of criticism and some verse. From 1850 onward, he wrote on matters of art and literature for *The Spectator* and other papers, defending the Pre-Raphaelite cause.

W. M. Rossetti is best remembered for his work in connection with Shelley (1869), Blake and Walt Whitman. His edition and memoir of Shelley (1869), with a carefully emended text and a dispassionate study of the poet's life, was invaluable at the time of its publication.

In 1874 he married Lucy (1843-1894), daughter of Ford Madox Brown, by whom he had five children.

W. M. Rossetti's most important works are: Blank verse translation of Dante's *Inferno* (1865); *Fine Art, Chiefly Contemporary* (1867); *Aldine Edition of Blake's Poems* (1874); *Lives of Famous Poets* (1878); *Collected Works of D. G. Rossetti* (1886-1904); *Life of Keats* (1887); *D. G. Rossetti: His Family Letters with Memoir* (1895); *Memoir of D. G. Rossetti* prefixed to *New Poems* (1896); *Ruskin, Rossetti, Pre-Raphaelitism* (1899), the first of a series of Family records; *Gabriel Rossetti—A Verified Autobiography* translated and supplemented (1901); *Some Reminiscences* (1905); *Democratic Sonnets* (1907).

ROSSI, PELLEGRINO LUIGI EDOARDO, COUNT (1787-1848), Italian economist, and statesman, was born at Carrara on July 13, 1787. He was educated at Pavia and Bologna. In 1815 he supported Joachim Murat, and on his fall left the country and went to Geneva, where he lectured on Roman law. He was made a citizen of Geneva, and as member of the extraordinary diet of 1832, was employed to draw up a revised Constitution, the *Pacte Rossi*. This was rejected, and Rossi went to France, where he was professor of political economy in the Collège de France, and in 1834 professor of constitutional law at Paris university. In 1839 he was given a peerage and in 1845 sent to Rome, where he became French ambassador. After the revolution of 1848 he stayed in Rome, and became minister of the interior under Pius IX. He was assassinated on the steps of the House of Assembly on Nov. 15, 1848.

As a statesman, Rossi was a man of signal ability and intrepid character, but it is as an economist that his name will be best remembered. His *Cours d'économie politique* (1838-54) gave in classic form an exposition of the doctrines of Say, Malthus and Ricardo. His other works were *Traité de droit pénal* (1829); *Cours de droit constitutionnel* (1860-67); and *Mélanges d'économie politique, d'histoire et de philosophie* (2 vols., 1857).

See Le Comte Fleury d'Iderville, *Le Comte Pellegrino Rossi, sa vie, ses œuvres, sa mort* (1887).

ROSSINI, GIOACHINO ANTONIO (1792-1868), Italian operatic composer, was born at Pesaro on Feb. 29, 1792. His father was town trumpeter and inspector of slaughter-houses, his mother a baker's daughter. The elder Rossini was imprisoned by the Austrians in 1796, and the mother took Gioachino to Bologna, earning her living as a *prima donna* singer at various theatres of the Romagna, where she was ultimately rejoined by her husband. Gioachino remained at Bologna in the care of a pork butcher, while his father played the horn in the bands of the theatres at which his mother sang. The boy learned singing and the pianoforte, and at thirteen appeared at the theatre of the Commune in Paër's *Camille*—his only appearance as a public singer (1805). He was also able to play the horn. In 1807 he was admitted to the Conservatorio di Bologna, but his insight into orchestral resources was gained rather by scoring the quartets and symphonies of Haydn and Mozart, than from his teachers. At Bologna he was known as "Il Tedeschino" on account of his devotion to Mozart. His first opera, *La Cenerentola* di *Matrimonio*, was produced at Venice when he was eighteen. Two years before he had received the prize at the Conservatorio di Bologna for his cantata *Il pianto d'Armonia per la morte d'Orfeo*. Between 1810 and 1813, at Bologna, Rome, Venice and Milan, Rossini produced operas of which the successes were varying. *Tancredi*, produced at the Fenice, Venice (1813) made him famous. The libretto was an arrangement of Voltaire's tragedy by J. A. Rossi. Traces of Paër and Paisiello were undeniably present in frag-

ments of the music. But the sweetness and clarity of such melodies as "Mi rivedrai, ti rivedrò" and "Di tanti palpiti," conquered Venice. Italians would sing "Mi rivedrai" in the law courts until called upon by the judge to desist. Rossini continued to write operas for Venice and Milan during the next few years, but without repeating the success of *Tancredi*.

In 1815 he retired to Bologna, where Barbaja, the impresario of the Naples theatre, engaged him as musical director of the Teatro San Carlo and the Teatro Del Fondo at Naples, on the understanding that he compose for each of them one opera a year. His payment was to be 200 ducats (about £35 or \$175) per month; he was also to receive a share in the gaming-tables, also owned by Barbaja, amounting to about 1,000 ducats (£175 or \$875) per annum. General enthusiasm greeted the court performance of his *Elisabetta regina d'Inghilterra*, in which Isabella Colbran, whom Rossini afterwards married, took a leading part. The opera was the first in which Rossini wrote the ornaments of the airs instead of leaving them to the fancy of the singers, and also the first in which the *recitativo secco* was replaced by a recitative accompanied by a quartet of strings. In *Almaviva* (Rome, 1816) the libretto, a version of Beaumarchais' *Barbier de Séville* by Sterbini, was the same as that already used by Paisiello in his *Barbiere*, an opera which had enjoyed European popularity for more than a quarter of a century. But Rossini had created such a masterpiece of musical comedy that the title of *Il Barbiere di Siviglia* passed inevitably to his opera.

Between 1815 and 1823 Rossini produced twenty operas. Of these *Otello* formed the climax, contrasting interestingly with the treatment of the same subject at a similar point of artistic development by Verdi. In deference to the taste of the day the story was made to end happily! The opera *Cenerentola* (1817) is to be ranked with the *Barbiere*, as a masterpiece in comedy. *Mose in Egitto* was produced at Naples in 1818. In 1821, Rossini married Isabella Colbran. In 1822 he directed his *Cenerentola* in Vienna, where *Zelmira* was also performed. After this he returned to Bologna; but an invitation from Prince Metternich to "assist in the general re-establishment of harmony" brought him to Verona at the opening of the Congress on Oct. 20, 1822. Here he made friends with Chateaubriand and Madame de Lieven.

In 1823, at the suggestion of the manager of the King's Theatre, London, he came to England, being much fêted on his way through Paris. In England he was given a generous welcome, which included an introduction to King George IV. and the receipt of £7,000 after a residence of five months.

In 1824 he became musical director of the Théâtre Italien in Paris at a salary of £800 per annum, and when the agreement came to an end he was appointed chief composer to the king and inspector-general of singing in France. The production of *Guillaume Tell* in 1829 brought his career as a writer of opera to a close. The libretto was by Etienne Jouy and Hippolyte Bis, but their version was revised by Armand Marrast. The music is free from the conventions discovered and utilized by Rossini in his earlier works, and marks a transitional stage in the history of opera. In 1829 he returned to Bologna on family business. His return to Paris was delayed by the July Revolution of 1830 until November 1830. Six movements of his *Stabat Mater* were written in 1832 and the rest in 1839, the year of his father's death, and the success of the work bears comparison with his achievements in opera; but his comparative silence during the period from 1832 to 1868 makes his biography appear almost like the narrative of two lives—the life of swift triumph, and the long life of seclusion, of which the biographers give us pictures in stories of the composer's cynical wit, his speculations in fish culture, his mask of humility and indifference. His first wife died in 1845, and political disturbances in the Romagna compelled him to leave Bologna in 1847, the year of his second marriage with Olympe Pelissier, who had sat to Vermet for his picture of "Judith and Holofernes." After living for a time in Florence he settled in Paris in 1855, where his house was a centre of artistic society. He died at Passy on Nov. 13, 1868.

See Stendhal, *Vie de Rossini* (1813); A. Azavedo, *G. Rossini, sa vie et ses œuvres* (1865); H. de Carzon, *Rossini* (1900).

ROSSLYN, ALEXANDER WEDDERBURN, 1ST EARL OF (1733-1805), Lord Chancellor of Great Britain, was the eldest son of Peter Wedderburn (a lord of session as Lord Chesterhall), and was born in Eden Lothian on Feb. 13, 1733. He was educated at Edinburgh university and entered the Inner Temple in 1753. It was always his intention to practise at the English bar, but in deference to his father's wishes he qualified as an advocate in Edinburgh in 1754, and practised there for three years. In 1757, following a quarrel with Lockhart, then dean of faculty, he left the Scottish bar, and was called at the Inner Temple. He engaged Thomas Sheridan and Macklin to teach him oratory and to eliminate his native accent. His countrymen, Lords Bute and Mansfield, were also useful to him, and it was he who suggested to Bute a pension for Dr. Johnson. Bute's influence got him into parliament in 1761, and he took silk in 1763. In 1767 he married an heiress. His political career after this is complicated in the extreme. In 1768 he was a Tory, but next year he resigned his seat over the Wilkes business, thereby winning enormous popularity in the country, and getting a pocket-borough from Clive in 1770. His new associates, however, distrusted him, and with reason; in January 1771 he deserted to the North ministry and was made solicitor-general. As Junius said "there is something about him which even treachery cannot trust." Throughout the American war he savagely attacked the colonies, and in 1778 he was made attorney-general. In 1780 he became Chief Justice of the Common Pleas with the title of Baron Loughborough. During North and Fox's coalition he was a commissioner of the great seal, and appears as leader of the Whigs in the Lords, with full expectations of the Woolsack. The King's recovery, however, blighted their hopes, and in 1792 Loughborough seceded from Fox, and became Lord Chancellor in Pitt's Tory cabinet. In 1801, Pitt's resignation was the end of him; Addington had no room for him, but he received the earldom of Rosslyn, and retired. He died at his country house near Windsor on Jan. 2, 1805, and was buried in St. Paul's. At the bar Wedderburn was the most elegant speaker of his time, and, although his knowledge of the principles and precedents of law was deficient, his skill in marshalling facts and his clearness of diction were marvellous; on the bench his judgments were remarkable for their perspicuity, particularly in the appeal cases to the House of Lords. For cool and sustained declamation he stood unrivalled in parliament, and his readiness in debate was universally acknowledged. In social life, in the company of the wits and writers of his day, his faculties seemed to desert him. He was not only dull, but the cause of dulness in others.

See Brougham's *Statesmen of the Reign of George III.*; Foss's *Judges*; Campbell's *Lives of Lord Chancellors*.

ROSTAND, EDMOND (1866-1918), French dramatist, was born on April 1, 1866, the son of a prominent Marseilles journalist and economist. His first play, a burlesque, *Les romanesques*, was produced on the 21st of May 1894 at the Théâtre Français. He took the motive of his second piece, *La Princesse lointaine* (Théâtre de la Renaissance, 5th April 1895), from the story of the troubadour Rudel and the Lady of Tripoli. The part of Mélisande was created by Sarah Bernhardt, who also was the original Photine of *La Samaritaine* (Théâtre de la Renaissance, 14th April 1897), a Biblical drama in three scenes taken from the gospel story of the woman of Samaria. The production of his "heroic comedy" of *Cyrano de Bergerac* (28th December 1897, Théâtre de la Porte Saint-Martin), with Coquelin in the title rôle, was a triumph. No such enthusiasm for a drama in verse had been known since the days of Hugo's *Hernani*. The play was quickly translated into English, German, Russian and other European languages. For his hero he had drawn on French 17th-century history; in *L'Aiglon* he chose for his theme the unhappy life of the duke of Reichstadt, son of Napoleon I. and Marie Louise, under the surveillance of Metternich at the palace of Schönbrunn. *L'Aiglon*, in six acts and in verse, was produced (March 15, 1900) by Sarah Bernhardt at her own theatre, she herself playing the part of the duke of Reichstadt, one of her most famous later rôles. In 1902 Rostand was elected to the French academy. *Chanteclair*, produced in February 1910, had Lucien Guitry in the title rôle. During

World War I he wrote chiefly patriotic verse. He died in Paris on Dec. 2, 1918.

His son, MAURICE ROSTAND, author of plays, made a sensation in 1928 by the production of *Napoleon IV*, in which it was sought to ascribe responsibility for the death of the prince imperial to Queen Victoria.

The following works by Edmond Rostand were published posthumously: *La dernière nuit de Don Juan* (1921); *Le cantique du Faïe* (1922); *Le Vol de la Marcellaise* (1923). See G. Haraszi, *Edmond Rostand* (1923); J. Suberville, *Le Théâtre d'Edmond Rostand* (1919).

ROSTOCK, a town of Germany, situated in the *Land* of Mecklenburg, one of the most important commercial cities on the Baltic. It is situated on the estuary of the Warnow, 8 mi. from the port of Warnemünde on the Baltic, 177 mi. N.W. of Berlin by rail, 80 mi. E.N.E. of Lübeck and 106 mi. S. of Copenhagen. Pop. (1939) 122,374. It is probable that the site was occupied by a village from very early times but the first definite mention of the settlement occurs in the 12th century. The town received its municipal charter in 1218. The earliest signs of commercial prosperity date from about 1260. In the 14th century it joined the Hanseatic league, and was one of the original members of the powerful Wendish Hansa, in which it exercised an influence second only to that of Lübeck. The most prosperous epoch of its commercial history began in the latter half of the 15th century. Rostock never entirely lost the independence which it enjoyed as a Hanse town. In the suburbs was located, after Hitler came to power, the Heinkel aircraft factory, one of the largest in Germany. As a result, the population of Rostock increased by 35,000 between 1933 and 1939. On April 28, 1942, a large British bombing squadron blasted Rostock and the Heinkel works with terrific results. Three more raids followed within a week. The aircraft factory was badly damaged, two large areas of Rostock were laid in ruins, and thousands of frightened citizens fled to the open country.

Rostock had five old churches: St. Mary's dating from 1398 to 1472, one of the most imposing Gothic buildings in Mecklenburg, with two Romanesque towers and containing a magnificent bronze font and a curious clock; St. Nicholas', begun about 1250 and restored in 1450 and again in 1890-94; St. Peter's, with a lofty tower built in 1400, which serves as a landmark to ships at sea; St. James', completed in 1588; and the church of the Holy Rood, begun in 1270. St. Mary's church contains a monument marking the original tomb of Hugo Grotius, who died in Rostock in 1645, though his remains were afterward removed to Delft. Among other buildings are the curious 14th-century Gothic town hall, the façade of which is concealed by a Renaissance addition; the former palace of the grand dukes, built in 1702; and the university buildings, erected in 1867-70. The University of Rostock was founded in 1418. From 1437 till 1443 it had its seat at Greifswald in consequence of commotions at Rostock, and in 1760 it was again removed, on this occasion to Bützow. The professors appointed by the city, however, still taught at Rostock, so that there were practically two universities in the duchy until 1789 when they were reunited at the original seat.

Rostock has a considerable trade, being the chief commercial town of Mecklenburg, and vessels drawing 19 ft. of water are able to get up to the wharves. By far the most important export is grain, but bricks, sugar and salt are also shipped. The chief imports are ordinarily coal, herrings, timber, wine and colonial goods. A train-ferry service to Denmark runs from Warnemünde, the outpost of Rostock.

ROSTOPTSCHIN, COUNT FEODOR VASSILIEVICH (1763-1826), Russian general, was born on March 23, 1763, in the government of Orel. The tsar Paul made him in 1796 adjutant general, grand marshal of the court, then minister of the interior. He was disgraced in 1801 for his opposition to the French alliance, but was restored to favour in 1810, and was appointed military governor of Moscow. He was charged with its defense against Napoleon. He is alleged to have instigated the burning of Moscow the day after the French had made their entry; it is certain that the prisons were opened by his order, and that he took no means to stop the outbreak. He defended

himself against the charge of incendiarism in a pamphlet printed in Paris in 1823, *La Vérité sur l'incendie de Moscou*, but he subsequently made grave admissions. Shortly after the Congress of Vienna, to which he had accompanied the tsar Alexander, he was disgraced. He returned to Russia in 1825, and died at Moscow on Feb. 12, 1826. His *Mémoires écrits en dix minutes* were posthumously published at St. Petersburg in 1853, his *Oeuvres inédites* in Paris in 1894.

ROSTOV-ON-DON, a seaport of the Russian S.F.S.R., in the North Caucasian area, in 47° 15' N., 39° 40' E., on the Sea of Azov, 25 mi. from the point where the Don river reaches that sea by a number of mouths, only two of which are used, one for shipping and one for rafts. A channel through the former has been dredged with a minimum depth of 14 ft. The river is frost-bound for 100 days per annum on an average. Trade consists of transit from rail or river vessels to lighters or local steamers on which cargoes are carried to Taganrog roads, there to be loaded for foreign voyages. Very few vessels from foreign ports reach Rostov itself. Imports and exports are thus practically the same as those of Taganrog (*q.v.*). Rostov is an industrial centre with shipbuilding yards, a dyeing industry, zinc, tobacco, boot and shoe factories and other enterprises. There is a fishing industry. It is linked by rail with the north and west, with the Volga river and with the Caspian sea. Pop. (1939) 510,253, much swollen in summer by seasonal hands coming in for the grain shipping industry.

During World War II Rostov-on-Don played a considerable role in the Russo-German campaign, being one of the main centres of the Ukrainian front. It changed hands many times and was definitely liberated only after the German retreat of 1943.

ROSTOV VELIKI, a town of the Russian S.F.S.R. in the region of Yaroslavl, in 57° 14' N., 39° 15' E., near Lake Rostov or Nero. Rostov was founded by the Slavs about 862, and played a great part in early Russian history as the centre of the Rostov principality. Its pink washed Kremlin (or citadel) walls have iron doors with quaint legends and paintings in each square; e.g., a crow on a branch with the legend, "I sing only to relieve my sorrow." Its ancient cathedral, with the famous peal of bells, its numerous church domes, its 12th-century shrines and relics, the alleys and closes of its market, give a wonderful picture of mediaeval Russian life. After the Mongol invasion of 1239-42, it rapidly declined and in 1474 was purchased by Ivan III and annexed to Moscow. It was repeatedly plundered by Tatars, Lithuanians and Poles in the 15th, 16th and 17th centuries. The population (23,305) is mainly employed in the drying of vegetables and medicinal herbs, in coffee and chicory preparation and in flour milling. There is fishing in the lake. The district was once famous for its enamelled icons.

ROSTRA (beaks), in Roman antiquities, the orators' platform which stood in Rome between the Comitium and the Forum, opposite the Curia. In 338 B.C. it was decorated by Gaius Maenius with the prows of ships captured from the people of Antium. From that time it was called *Rostra*, having previously been known as *templum* (literally consecrated place), since it had been consecrated by the augurs. Here were exhibited the statues of famous Romans, and state documents and memorials (the laws of the Twelve Tables, etc.). Caesar had it pulled down, intending that it should be rebuilt on the west side of the Forum, but it was left for Augustus to carry out his plan. The use of the term *Rostra Vetera* by classical authors makes it doubtful whether the old platform was entirely demolished, unless the name was simply transferred to the new rostra of Augustus to distinguish it from the *Rostra Julia*. This consisted of a rectangular platform, 78 ft. long, 11 ft. above the level of the Forum, reached by steps from the back; in front there was a marble balustrade with an opening in the centre where the speaker stood. In the existing remains, the holes in which the beaks of the ships were fastened are visible. See *ROME: The Forum*.

BIBLIOGRAPHY.—For results of the excavations see C. Huelsen, *Das Forum Romanum*, Eng. trans. by J. B. Carter (Rome, 1906); see also O. Richter, "Topographie der Stadt Rom," in I. von Mueller, *Handbuch der klassischen Altertumswissenschaft* (1907); H. Thüden, *Le Forum Romain*, 3rd ed. (1904); J. E. Sandys, *Companion to Latin Studies* (1921).

ROSWELL, a city of southeastern New Mexico, U.S., the county seat of Chaves county; 200 mi. N.E. of El Paso, Tex., at an altitude of 3,570 ft., 8 mi. from the Pecos river, on federal highways 79, 380 and 285 and served by the Santa Fe railway and by Continental and Pioneer air lines. Pop. (1950) 25,738; 13,482 in 1940 by federal census. It is a trade centre for fertile farm lands and an extensive stock-raising region; the seat of the New Mexico military institute and Walker Air Force base; and the gateway to the Lincoln National forest of 1,500,000 ac. in the Gallina, Capitan, White, Sacramento and Guadalupe mountains. There are oil fields in the vicinity. Roswell was founded in 1885, as a cattle-trading point. The railway reached it from the south in 1894 and from the east in 1898. The city was incorporated in 1890.

ROSYTH, a former village of Fifeshire, Scotland, on the north shore of the Firth of Forth, 21 mi. S. by rail from Dunfermline (with which it was incorporated in 1911), with a halt on the Scottish Region railway route from Edinburgh to Dunfermline. The plans for the establishment of a large naval base there, drawn up in 1903, were modified in 1908; 285 ac. of foreshore and 1,184 of land behind were purchased, and work begun in 1909.

The original scheme included a high-level main basin covering an area of 55 ac., with an entrance lock from the fairway, a dry dock, a submarine tidal basin, and the construction of an entrance channel. A great sea wall was built to form the southern boundary of the docks, the number of which was increased from one to three. Great progress had been made by the outbreak of World War I, and operations were pushed vigorously. Rosyth was used as a secondary base to Scapa Flow, particularly for battle cruisers. It was decided in 1925 to reduce the dockyard to the basis of a care and maintenance establishment.

ROTA, COURT OF, one of the departments of the mediaeval papal organization in the Vatican. The Rota was the supreme court of appeal of Christendom. It declined in importance when a special court of appeal for Italy was set above it, and more so as the geographical jurisdiction of the pope was gradually lessened. After the Council of Trent the old arrangements were replaced by the congregations, permanent committees of cardinals which deal with definite branches of business. The Rota, however, was restored to its functions as supreme court of appeal by Pope Pius X in 1908.

See CURIA ROMANA; and art. "Rota" in the *Catholic Encyclopedia*. **ROTARY CLUB**, an organization of business and professional men founded for the purpose of furthering the ideal of service to others in all relationships. The first Rotary club was founded in Chicago, Ill., on Feb. 23, 1905, by a lawyer, Paul P. Harris. The members met in rotation at the offices or places of business of the various members. This method suggested the name, Rotary club. Similar clubs were organized in other cities of the U.S. and in Aug. 1910, at Chicago, the 16 clubs then in existence formed the National Association of Rotary Clubs. In 1912, after the formation of clubs in Winnipeg, Can.; Dublin, Ire.; and London, Eng., the organization became the International Association of Rotary Clubs. In 1922 the name was changed to Rotary International.

The objects of Rotary are: to encourage and foster the ideal of service as a basis of worthy enterprise and, in particular, to encourage and foster (1) the development of acquaintance as an opportunity for service; (2) ethical standards in business and professions; the recognition of the worthiness of all useful occupations and the dignifying by each Rotarian of his occupation as an opportunity to serve society; (3) the application of the ideal of service by every Rotarian to his personal, business and community life and (4) the advancement of international understanding, good will and peace through a world fellowship of business and professional men united in the ideal of service.

The program of Rotary based on these objects brings together in an atmosphere of personal friendship men of very diverse occupations and of different religious faiths and political beliefs. Some clubs such as those in Cairo, Egypt; Singapore; Shanghai, China; and others have a membership composed of many different nationalities and races.

Membership in Rotary is based upon activity in a business or profession. One representative of each business, profession or institution in a community may be elected to membership. A second active member, who is a junior member of the firm or organization of which the first active member is a senior member, may be elected to membership. Men who have distinguished themselves by some meritorious service may be elected to honorary membership. The affairs of each club are administered by a board of directors assisted by various standing committees. The officers (president, vice-president, secretary and treasurer) are elected annually. Clubs hold weekly luncheon meetings. Membership in the club is forfeited if the required standards of attendance are not maintained. Clubs are banded together in districts. The club presidents and secretaries in each district meet together each year. Delegates and members of the clubs of each district meet in annual district conference. The affairs of the district are administered by a governor who is nominated by the district conference and elected by the delegates at the annual international convention. The governor is the representative of Rotary International in his district. Each year representatives of all the clubs in Rotary International assemble in convention. The annual international convention elects a president who, with a board of directors, administers the affairs of Rotary International. The constitution provides that of the 14 directors, at least 7 must be from countries other than the United States.

A permanent secretariat consisting of the secretary, assistant secretaries and staff, is maintained with offices at Chicago, Ill., U.S.; Zurich, Switz.; and London, Eng. The official publications are *The Rotarian* (English) and *Revista Rotaria* (Spanish) published at Chicago. Several other Rotary magazines are published in various languages by districts or groups of districts.

In 1951 there were 7,400 Rotary clubs with a membership of 350,000 business and professional executives in 83 countries and regions. By the same year 284 Rotary fellowships for graduate study for one year in foreign countries, ranging from \$1,800 to \$3,400, had been awarded to students from 42 countries.

The Rotary movement in Great Britain and Ireland was started in 1911 with the organization of a Rotary club in Dublin by an Irishman who, while in the U.S., had been a member of the San Francisco Rotary club. About the same time a club was organized in London by Rotarians from Chicago and Boston who had business connections in London. The club in Manchester was formed by London Rotarians and subsequently clubs were formed in Belfast, Glasgow, Edinburgh, Liverpool and Birmingham. During the war period from 1914 to 1918 the number of clubs in Great Britain and Ireland increased to 24 and there were in 1950 685 clubs divided into districts with a general council consisting of a president, immediate past president, vice-president, treasurer, secretary and the Rotary International representatives in the several districts. There were approximately 30,700 Rotarians in the clubs in Great Britain and Ireland in 1950. Each year one member of the board of directors of Rotary International is elected from this region. Rotary International in Great Britain and Ireland has a secretariat at London, a number of committees, an annual conference of delegates and members from all clubs in the region, and issues a monthly publication (*The Rotary Wheel*). The Rotary movement in Great Britain and Ireland differs in no essential way from the movement in other parts of the world. Clubs meet weekly for luncheon and have a speaker on a topic of general interest, preferably one reflecting in a general way the Rotary ideal of service to others.

(C. R. P.; X).

ROTARY ENGINE. A type of engine in which the use of reciprocating parts is avoided with the object of saving the energy wasted in converting reciprocal or to-and-fro movement into rotary movement. The rotary principle never had any practical success in competing with the smaller reciprocating engines, but steam turbines (which are really a class of rotary engine) furnished the first solution of the problem for moderate and large size installations. Many rotary mechanisms have been tried. Some have comprised a flap piston rotating within a cylinder, the pressure of the steam causing rotation. Sometimes the flap has a sliding action within the piston, the shaft of the latter being mounted eccentrically in relation to the bore. More or less complicated arrangements of levers and of gears were also patented, with multiple

pistons. James Watt's famous attempt was really a semirotary engine, with a radial piston which swung to and fro and actuated a pinion and rack device for working the rods of pit pumps.

In the earlier periods of aeroplane construction rotary engines were much employed, notably the Gnome and the Le Rhône, but the radial engine later formed the equivalent of these types. Weaknesses of the rotary aero engine, in use during World War I, were the fact that it could be lubricated with only castor oil and the objectionable gyroscopic action produced by its rotating mass. Yet the rotary principal found great success in certain other directions, such as pumps, blowers and gas-exhausters. The latter are in principle blowers reversed. In a well-known type the piston or piston is set with its axis eccentrically in the cylinder, and radial blades slide in its slots, making a gas-tight fit against the bore. The drum rotates and pumps the gas from the inlet which is at one side of the cylinder to the outlet at the other side.

After World War II there was a continuous development of the gas turbine. In a gas turbine an atomized oil-air mixture burns and produces an expanding gas that serves the same function as steam. Great difficulties were overcome in developing materials that operate under the extremely high temperatures of the gas turbine. Gas turbines are used for stationary power installations particularly where there is a shortage of water for operating a steam plant. (See AERO ENGINES; TURBINE, STEAM.)

ROTARY TILLER: see TILLAGE MACHINERY.

ROTATION OF CROPS refers to the repeated growing of different kinds of crops in a specific order, on the same land, in contrast to a one-crop system or to haphazard crop successions. The time required to complete a growing cycle will depend upon the number of crops and whether the changes are seasonal, annual, biennial or perennial. For field crops, the successions are usually repeated in periods ranging from two to eight years. Rotations may classify as both good and bad. The basis for judgment rests in the changes brought about in the soil and in production economy. The beneficial effects of well-planned cropping systems are such, however, that few farmers can afford to neglect them.

On many farms, the cropping systems are confined chiefly to crops that tend to give the highest immediate cash returns. This usually means the intensive use of row crops like corn, cotton and soybeans that require annual plowing for seedbed preparation, as well as cultivation during the growing season. If continued too long such systems bring about unfavourable changes in the soil: (1) sizable reductions in organic matter and nitrogen; (2) development of less desirable physical conditions; (3) accelerated loss of soil and water by surface runoff; and (4) lowered nutrient-supplying powers. Such changes are often accompanied with greater damage to the crop from insects, diseases and weeds. The end results are declining yields, loss of crop quality and reduced incomes. Cropping practices need to be considered, not only from the immediate point of view, but from their long-time effects as well. Good crop rotations will not prevent all of the unfavourable effects of crop production on the soil, but they will do much to ensure the continued efficient use of the soil.

Rotation planning consists essentially in fitting soils and crops together in such ways as to be desirable and suitable for livestock, grain, truck garden or other type of farming. The harmonious balances developed between soil, water and vegetation in the natural landscape, suggest some of the underlying principles. The soil is rarely devoid of vegetation and sod-forming crops are much in evidence. In field crop production, carefully selected row crops should be balanced with equally well-selected close-growing grain and sod-forming crops, the latter of which may be legumes, nonlegume grasses or combinations of these. The acreage devoted to the sod-forming crops should be expanded at the expense of the row crops on soils of increasing slope and declining fertility. This will provide better vegetative covering to protect sloping lands from excessive erosion and supply organic matter for improving soil productivity on both sloping and level lands. With lessening slope and increasing fertility the row crops may be expanded, but this should not be done with too much reduction in the sod-forming crops.

The differing effects of crops on soils, on each other and in behaviours to insect pests, crop diseases and weeds, require carefully planned crop sequences. Often the less desirable of these effects can be offset by the order in which crops follow each other. If, for instance, corn, a high nitrogen requiring crop, fol-

lows a small grain, it may suffer seriously from nitrogen starvation, in some seasons. If the preceding crop were a satisfactory legume, this difficulty would not arise and higher yields would be obtained.

Rotation planning should also include a consideration of the crop handling practices. Sufficient legume residues should be returned to the soil, either directly or indirectly through animal manure, to supply all or much of the nitrogen required by the rotation. Sufficient nonlegume residues (stover and straw) should be associated with the legume residues to obtain the greatest benefits from the legume crops. Experiments show that association increases the yields of succeeding crops more than the combined yields obtained from the two types of residues used separately. These benefits cannot be secured if these residue materials are destroyed or removed from the land.

Broadly speaking, cropping systems should be built around the use of deep-rooted legumes. If too little use is made of these crops, productivity will decline; if too much land is devoted to them, wastes may occur and other useful crops will be displaced. Rotations depending wholly on green manure legumes should be confined to the more fertile and level lands. It will be desirable to include legumes alone or in mixtures with nonlegume sod-forming crops, as a regular crop in most field rotations. In general, this should occur about once in every four years.

Satisfactory rotations may be planned for time periods ranging upward from two years. Rotations for short periods, however, are not likely to provide the best crop balances, while longer rotations may become too complicated. Four-field rotations, generally, provide adequately for the requirements of good cropping. One-fourth of the land can be kept in sod crops and three-fourths in the row and the close-growing grain crops. Additional flexibility can be obtained by employing split cropping on one or more fields.

If the sod crop is a perennial legume like alfalfa, additional advantages can be secured by bringing these crops in two successive rotations together in one two-year period. With this modification the perennial legume will be seeded only every other year. This will permit the seeding of a green manure crop like sweet clover, in the alternate years when the perennial legume is not seeded. The original four-field rotation will be in evidence each year, but it will take eight years to complete the cycle. The sequences on one field for the four-crop rotation of (1) corn, (2) soybeans, (3) oats, (4) alfalfa, under the above modification will be as follows: (1) corn, (2) soybeans, (3) oats (sweet clover), (4) corn, (5) soybeans, (6) oats, (7) alfalfa, (8) alfalfa. Practical farmers will discover in this plan advantages other than those mentioned.

In addition to the many beneficial effects on soils and crops, well-planned crop rotations also provide the business aspects of farming with advantages. Labour, power and equipment can be handled with more efficiency; weather and market risks can be reduced; livestock production requirements can be met more easily; the farm can be made a more effective year-round enterprise. In other words, good crop rotations are indispensable to a smooth running and effective farm organization. Using a well-designed cropping system is a major farm problem (See also SOIL.) (F. C. Bk.)

ROTHAMSTED EXPERIMENTAL STATION, an agricultural research institution founded by J. B. Lawes (1816-1900) on his estate of Rothamsted, an ancient manor at Harpenden, England. Inheriting the estate as a young man (1834), he began about 1838 to try the effects of various substances on crop growth. At that time there was no general agreement as to the chief plant nutrients, nor the form in which they were obtained by the plant. Wishing to extend his experiments, he invited a young chemist, J. H. Gilbert (1815-1901), to join him in the spring of 1843. These two worked together until 1900 in what must be one of the longest scientific partnerships on record. Field plots were laid out to study the effect of additions of various salts and nitrogen sources. The successful results of these experiments led to the development of the fertilizer industry, in which Lawes himself had a direct part. He showed that the

phosphate of natural rock deposits could be rendered soluble and available to plants by treatment with sulphuric acid, and in 1843 set up a factory near London to produce "superphosphate" and other "artificial fertilizers," a venture that was highly successful.

The field experiments were continued year after year unchanged, in order that cumulative effects might be determined. Careful records were made of weather, crop and soil conditions; samples of crop and soil were analyzed. These field plots are by far the oldest continuously maintained. On the Broadbalk field, on which nothing but wheat had been grown, the 100th successive crop was harvested in 1943. On Hoos field barley had been grown every year since 1853, hay had been taken from the park grass plots every year since 1856 and root crops on Barnfield since 1856. In addition to the continuously cropped fields, Lawes and Gilbert also studied the use of fertilizers in rotations including one year of legume or fallow. The type of field experimentation introduced by them served as a pattern for many other experiment stations established in the latter part of the 19th century.

Although plant nutrition was their major interest, Lawes and Gilbert carried out quantitative experiments on animal feeding that became classical. By killing and analyzing the animals at the end of the trials they were able to prove that animal fat was produced not only from vegetable fat but regarded as its sole source, but also from carbohydrate and protein.

The first soil bacteriological investigations in England were carried out at Rothamsted by Robert Warrington, who commenced in 1878 a study of the nitrifying process in soil. He proved soil nitrification to be a biological process proceeding in two steps, from ammonia to nitrite and nitrite to nitrate, but was unable to isolate the organisms responsible because of the limitations of the bacteriological techniques then available.

Until 1896 the Rothamsted experiments were a personal venture on the part of Sir John Lawes and were maintained at his own expense. Before his death in 1900, however, he set up and endowed a trust for the continuation of the experiments. The trustees are appointed by the leading scientific and agricultural societies of Britain and constitute the governing body.

On the death of Gilbert in 1901, A. D. Hall (1861-1942) was appointed director. He realized that there was much information of value in the Rothamsted experiments that had not been made available in a form most likely to reach those who might make use of it, and accordingly he reviewed and summarized the findings to that time in *The Book of the Rothamsted Experiments*, which first appeared in 1905. He recognized that agricultural research, which hitherto had largely been a branch of agricultural chemistry, was becoming too complex to be carried on by one or two men and accordingly he slowly added to the staff specialists in various fields. The broadening scope of their work indicated the possibilities of scientific agriculture.

No funds from government sources were granted for agricultural research until 1909, when the principle of government assistance was established and the Development Commission was set up by Lloyd George, then prime minister, for the proper allocation of the money set aside for this and related purposes. It became necessary to organize the framework of agricultural research and education in the United Kingdom, and in 1912 Hall left Rothamsted to devote himself wholly to this work. He was succeeded by Sir Edward J. Russell, who retired in 1943. In order to prevent unnecessary overlapping, various institutions were designated as being the major centres for particular fields of agricultural science, and Rothamsted became the recognized institution for the study of soil and plant nutrition and of certain plant diseases affecting crop production. After that time the station was largely supported by funds from various official sources.

The later contributions of Rothamsted workers were of a diverse character. In the early 1900s, considerable emphasis was placed on the microbiology of the soil, and extensive studies were made of the different groups of organisms present and their interrelationships. A department of soil physics was established for the examination of the physical properties of soils as they affect plant growth and farming operations. The accumulated volume of field data had become very great, and accordingly a statistical department was set up to study correlations between crop yields, weather, soil conditions and fertilizer treatments. New procedures of field experimentation and statistical analysis were developed by R. A. Fisher involving the principle of replication and randomization of treatment to eliminate the effects of soil heterogeneity and other experimental errors.

The Rothamsted station possesses an extensive library, remarkably complete in agricultural journals from all parts of the world and including many early and rare books on agriculture. (A. G. N.)

ROTHER, RICHARD (1799-1867), Lutheran theologian, was born at Posen on Jan. 28, 1799. He studied theology in the universities of Heidelberg and Berlin (1817-20) under Karl Daub (1765-1836), Schleiermacher and Neander. In the autumn of 1823 he was appointed chaplain to the Prussian embassy in Rome, of which Baron Bunsen was the head. This post he exchanged in 1828 for a professorship in the Wittenberg theological seminary,

of which in 1832 he became also second director and *ephorus*. In 1837 he became professor and director of a new clerical seminary at Heidelberg; in 1849 he was professor and university preacher at Bonn, but in 1854 he returned to Heidelberg as professor of theology, and afterward became member of the Oberkirchenrath, a position he held until his death on Aug. 20, 1867. His removal to Heidelberg and the publication of his *Die Anfänge der christlichen Kirche und ihrer Verfassung* (1837), coincide with the attainment of the principal theological positions with which his name is associated. Rother's most important work is his *Theologische Ethik* (3 vols., 1845-1848; 2nd ed., 5 vols. 1867-71).

See F. Nippold, *Richard Rother, ein christliches Lebensbild* (3 vols., Wittenberg, 1873-74); W. Honig, *Richard Rother, sein Charakter, Leben und Denken* (1868); Adolf Hausrath, *Richard Rother und seine Freunde* (1902).

ROTHENBURG-OB-DER-TAUBER, a Bavarian town of Germany, in Middle Franconia, 49 mi. by rail W. of Nürnberg. Pop. (1939) 9,332. Rothenburg-ob-der-Tauber, mentioned in the chronicles in 804 as *Rotinburg*, first appears as a town in 942 and in 1108 passed to the family of Hohenstaufen. In 1172 it became a free imperial city and it attained the zenith of its prosperity under the famous burgomaster Heinrich Toppler (1350-1408). It is probably the finest surviving example of a mediaeval town, flanked by mediaeval walls, towers and gates. Perhaps the most interesting building is the town hall, one part of which dates from 1240 and the other from 1572. The latter is a beautiful Renaissance structure and contains a grand hall in which every Whist Monday a play, *Der Meistertrunk*, which commemorates the capture of the town by Tilly in 1631, is performed. It has manufactures of toys, soap and agricultural machinery, and breweries, linen weaving establishments, sandstone and limestone quarries.

ROTHERSTEIN, SIR WILLIAM (1872-1945), English artist, born at Bradford, Yorks., on Jan. 29, 1872, was educated at Bradford. In 1888 he studied in the Slade school under Legros, and afterwards worked in Paris. In 1893 he began exhibiting at the New English Art club. From 1917 to 1926 he was professor of civic art at the University of Sheffield, and was principal of the Royal College of Art 1920-35. His paintings include "The Browning Readers" (1900), "The Dolls' House" (1900), and "Jews Mourning" (1905), Tate gallery; "Aliens at Prayer" (1904), Melbourne art gallery; "Carrying the Law" (1910), "Morning at Benares" (1911), "Bourlon Church" (1919) and "The Last Phase, on the Rhine" (1919). Among his portraits may be mentioned those of Augustus John, Walker art gallery, Liverpool; Sir Francis Darwin (1905), Mr. Charles Booth (1908), Liverpool university; Prof. Alfred Marshall (1908), Cambridge; Mr. Bernhard Berenson (1910) and Sir Rabindranath Tagore (1912), besides a portrait of himself (1900), Metropolitan museum, New York. His portrait drawings are notable for their sound draughtsmanship. He was one of the artists who decorated St. Stephen's hall, Westminster. He was knighted in 1931. Rotherstein died on Feb. 14, 1945.

His published works include *Oxford Characters* (1896); *English Portraits* (1898); *The French Set, and Portraits of Verlaine* (1898); *Manchester Portraits* (1899); *Liber Juniorum* (1899); *A Life of Goya* (1900); *Plea for a Wider Use of Artists and Craftsmen* (1918); *Twenty-four Portraits* (first series 1920, second series 1923); *Ancient India* (1925); *Men and Memories* (3 vols., 1931-39).

ROTHERHAM, a county and parliamentary borough in the West Riding of Yorkshire, England, 5 mi. N.E. of Sheffield, on the L.M.S. and L.N.E. railways. Pop. (1938) 76,430. Area 14.5 sq. mi. It lies at the confluence of the Don with its tributary the Rother, which affords a notable north-to-south route on the east side of the Pennine upland, and for more than 40 years a branch from Rotherham along the Don valley was Sheffield's only link with the main railway line. Rotherham is connected by the Don canal with Goole and the Humber and is an important railway and road junction. It is a small counterpart of Sheffield, possessing iron, steel and brass works, railway wagon works, potteries, glassworks, breweries, sawmills and ropeyards. Ironworks were established at Masborough on the opposite bank of the Don in 1746. Rotherham came into some prominence as

a city of mediaeval life and education. Rotherham was taken by the royalists in 1643, but after the battle of Marston moor, it was surrendered to a detachment of parliamentary forces. It was incorporated in 1871 and became a county borough in 1902. The town developed rapidly, and a large planning scheme came into operation. A technical college and art school and a central public library were opened in 1931. In 1943 there were four large parks and 250 ac. of playing fields. The parliamentary borough returns one member. Nearby is Wentworth Woodhouse, seat of earl Fitzwilliam.

ROTHERMERE, HAROLD SIDNEY HARMSWORTH, 1ST VISCOUNT (1868-1940), British newspaper proprietor, was the second son of Alfred Harmsworth, and brother of Viscount Northcliffe. He was born on April 26, 1868, London, was created a baronet in 1910, Baron Rothermere in 1914 and Viscount Rothermere of Hemsted, after his services as air minister, in 1918. He married in 1893 Mary Lilian, daughter of George Wade Share.

At the age of 21 he entered the publishing firm of which his brother, Alfred, was the principal, soon after the date when *Answers* was launched. He assisted in developing the business on sound and economic lines, and for the next 20 years was the close associate of his brother in all his great undertakings. He took an important part in the reorganization of *The Evening News*, London, was one of the three principals in the establishment of *The Daily Mail* (1896) and was largely responsible for developing its methods of distribution. He founded *The Daily Record* (1895), bought *The Leeds Mercury* and shared in the purchase of *The Times* (1908). He became known also as a most generous benefactor of charities. By the gift of a large sum he enabled the Union Jack club to provide worthy accommodations for sailors and soldiers in London; and he gave £10,000 to the Territorial Force County of London association. In 1910 he founded the King Edward chair of English literature at Cambridge, and in 1910 he ceased his connection with *The Times*, *The Daily Mail* and *The Evening News*. In 1914 he acquired *The Daily Mirror* from Lord Northcliffe and in 1915 he founded *The Sunday Pictorial*, the first fully illustrated Sunday newspaper in London. On the death of Lord Northcliffe, in Aug. 1922, Lord Rothermere by purchase acquired control of *The Daily Mail* and Associated Newspapers Ltd.; subsequently he bought large newspaper properties owned by E. Hulton & Co. Ltd. He was air minister in 1917-18. He retired from active business in 1938 but accepted a wartime mission to Canada in 1940. His health broke, and he died at Hamilton, Bermuda, Nov. 26, 1940.

(H. W. W.; X.)

ROTHERS, EARLS OF. The first earl of Rothes was George Leslie, son of Norman Leslie of Rothes in Moray and of Ballinbreich in Fife. In 1445 he was created Baron Leslie of Leven, and about 1458 earl of Rothes in the peerage of Scotland. His grandson GEORGE, the 4th earl (d. 1558), whose father, William, the 3rd earl, was killed at Flodden, was accused, but acquitted in 1546, on complicity in the murder of Cardinal Beaton, in which his brother and his two sons were undoubtedly implicated; he was one of the Scottish commissioners who witnessed the marriage of Mary Queen of Scots with Francis, the dauphin of France.

His son ANDREW, 5th earl of Rothes (d. 1611), took an active part with the lords of the congregation, first against the queen-mother, Mary of Guise, when regent of Scotland, and afterward against Mary Queen of Scots in opposing her marriage with Darnley, and in devising the murder of David Rizzio. He was, however, one of the peers who acquitted Bothwell of Darnley's murder; and going over to the side of the queen, he fought for her at Langside. He continued to occupy a position of some prominence in Scottish affairs until his death in 1611.

His great-grandson, JOHN, 7th earl of Rothes (1630-1681), held a command in the Royalist army at the battle of Worcester in 1651, and accompanied Charles II to England at the Restoration, when he became lord president of the council in Scotland. He was lord treasurer of Scotland from 1663 till 1667, when he was made lord chancellor of Scotland for life. His estates having been sequestered by the parliament in 1651, he received a re-grant in

1663 of the earldom of Rothes.

See Sir R. Douglas, *The Peerage of Scotland*, ed. Sir J. B. Paul; and G. E. C., *Complete Peerage*.

ROTHERSAY, a royal and small burgh, and the chief town of the county and island of Bute, Scotland. Pop. (est. 1938) 8,161. It is situated on a beautiful bay, 40 mi. S.W. of Glasgow, with which there is regular communication by steamers from Wemyss Bay, Gourock, Greenock, Craigendoran, Adirshaig, Inveraray, Glasgow, etc. It is a popular watering place with a promenade 4 mi. long. The sheltered bay affords excellent anchorage, and is the headquarters of the Royal Northern Yacht club. Rothersay is a centre for the herring fisheries, and the head of a fishery district. The town is under the jurisdiction of a provost and council. Owing to its mild and equable climate it is a resort of invalids. There is a tramway to Port Bannatyne, on the east horn of Kames bay (now practically part of Rothersay), and to Eitrick bay; and Craigmore, about 1 mi. west of Rothersay, is a suburb. Ardbeg Point, Loch Fad, Loch Ascog and Barone hill (530 ft.) are all within a mile and a half of the town, and the Kyles of Bute within a short sail.

In the centre of the town are the ruins of a castle erected in 1098 either by Magnus Barefoot, king of Norway, or by the Scots as a defense against the Norwegians, with whom during the 13th century, and earlier, there was constant strife. The village which grew up round the castle was made a royal burgh by Robert III, who, in 1398, created his eldest son David duke of Rothersay, a title which became the highest Scottish title of the heir-apparent to the crown of the United Kingdom. During the Commonwealth the castle was garrisoned by Oliver Cromwell's troops. It was burned by the followers of Argyll in 1685, and remained neglected till the rubbish was cleared away by the second marquess of Bute in 1816. It was repaired by the third marquess.

ROTHSCHILD, the name of a Jewish family which has acquired an unexampled position from the magnitude of its financial transactions. The name was derived from a red (*rot*) shield on the house in which the family lived, in the ghetto of Frankfurt-on-Main, during the early period of its history. Setting up as a moneylender, Mayer Anselm (1744-1812), born on Feb. 23, 1744, became agent in 1801 to the wealthy prince William, 6th landgrave, later elector of Hesse-Cassel. In his first large loan (1802) to the Danish government, Mayer Anselm acted as the front for his prince.

By the time Mayer Anselm died, leaving five sons and five daughters, his third son, Nathan Mayer (1777-1836), born on Sept. 16, 1777, was well established in England, where he had gone about 1798 to seek advantageous textile connections. Nathan Mayer came to be regarded as the financial genius of the family. His bold and brilliant innovations, together with his firm belief in Napoleon's defeat, won him the gratitude of the English government. After he had successfully negotiated some of Wellington's drafts which the English government was unable to meet, Rothschild became the chief representative of the Allied powers in their loan arrangements. He helped to popularize foreign loans in Britain by issuing them in sterling and making the interest payable in London.

Anselm Mayer (1773-1855), born on June 12, 1773, Mayer Anselm's eldest son, took over the Frankfurt house, became a member of the Prussian privy council of commerce and in 1820 Bavarian consul and court banker. Solomon (1774-1855), born on Sept. 9, 1774, settled in Vienna, where his intimate relations with Metternich served as the continental link between the firm and the Allied powers. The Naples branch was established by Karl (1788-1855), born on April 24, 1788, and although originally significant, it was discontinued after the annexation of Naples to Italy in 1860. Jacob (1792-1868), born on May 15, 1792, also known as James, was the youngest brother. He started a business in Paris after the restoration of the Bourbons, for whom he negotiated large loans.

One of Nathan Mayer's few examples of shortsightedness was his failure to foresee the future of railways in England. Family co-operativeness, however, turned his mistake into an advantage for Jacob and Solomon, who sponsored the construction of the

first railways in France and Austria.

Legends surrounding the early generations of the family have it that Mayer Anselm guarded the elector's wealth during the Napoleonic invasion by burying it and that Nathan Mayer had direct carrier-pigeon information about the battle of Waterloo. Another tale says that Nathan Mayer was himself a spectator of the battle.

All the sons of Mayer Anselm received the right to use *von* before their names in 1817 and were made Austrian barons in 1832. But not until 1842 did Solomon, as a Jew, receive special dispensation to own real property in Austria.

The important London house, after Nathan Mayer's death on July 28, 1836, was managed by his son Lionel (1808-1879), born on Nov. 22, 1808. Lionel was elected a member of parliament for the City of London in 1847, but his fidelity to the Jewish faith barred him from the customary Christian oath, and he could not take his seat. Returned by his constituency in 1849, 1852 and 1857, he remained unelected until 1858, when an act of parliament and a resolution of the house of commons made a variation of the oath possible. Lionel remained in commons until 1874.

Lionel's son, Nathaniel Mayer (1840-1915), born on Nov. 8, 1840, inherited a baronetcy from his uncle Anthony (1810-1876), born on May 29, 1810, and was made a peer in 1875 by W. E. Gladstone—the first Jew to be raised to the peerage. From 1865 until 1885 he was Liberal M.P. from Aylesbury. The second baron, Lionel Walter (1868-1937), born on Feb. 8, 1868, was a naturalist. Some 280,000 skins from his bird museum in Tring park were bought by the American Museum of Natural History in New York in 1932. After his death the British museum acquired most of the 1,500,000 butterflies and moths in the collection.

On the continent the French and Austrian houses retained their importance, although the Frankfurt house remained open until 1902. The interests of the houses did not notably cross over to the western hemisphere.

Mayer Anselm's Jewish piety was transmuted in his descendants to interest in the welfare of their co-religionists everywhere. Solomon won Clemens Metternich's support for emancipatory measures for the Jews of Europe. In England the head of the Rothschild family has been considered the lay head of British Jewry; the Balfour declaration of Nov. 2, 1917, stating that the government viewed with favour "the establishment of a national home for the Jewish people" in Palestine, was addressed to Lionel Walter. Edmond James (1845-1934), born on Aug. 19, 1845, of the French branch of the family, invested more than 70,000,000 gold francs in helping to establish Jewish communities in Palestine.

Political interests have absorbed some members of the family. Lionel Nathan (1882-1942), born on Jan. 25, 1882, was a member of the house of commons from 1910 to 1923. James Armand (1878-), born on Dec. 1, 1878, entered the house of commons in 1929. Maurice (1881-), born on May 19, 1881, of the French house, was a member of the French senate.

When the Nazi Reich and its anti-Semitic doctrines overran Austria in 1938, Louis (1882-), born on March 5, 1882, was held prisoner in Vienna for more than a year. Among the many members of the family in France who left the country as the result of the Nazi invasion in 1940 were Edouard (1868-1949), born on Feb. 24, 1868, who was president of the *Chemin de fer du Nord*, and Henri (1872-1947), born on July 26, 1872, a physician and playwright.

Roth, *The Magnificent Rothschild* (1930).

ROTHWELL, urban district, West Riding of Yorkshire, England, 4 mi. S.E. of Leeds. Pop. (est. 1938) 24,440. Area, 167 sq.mi. Soon after the Conquest, Rothwell was a dependency of the castle of Pontefract, and a baronial residence, of which there are slight remains, was erected here. Coal and stone are obtained here and the town has match works and rope and twine factories.

Methley urban and Hunslet rural districts were added to Rothwell in 1937.

ROTIFERA (or Rotatoria), a well-defined class of aquatic animals of microscopic size, remarkable for the astonishing diversity of their forms, the vivacity and variety of their movements and the high level of their structural development. Being extremely transparent, the largest can hardly be detected by the unaided eye. In length they rarely exceed 1.7 mm. or $\frac{1}{16}$ in., ranging downward to 0.3 mm., and they probably average under .25 mm., with breadth and thickness very considerably less. In general rotifers are compact in body and symmetrical in structure. They are plentiful in most weedy ponds and boggy pools, and are also to be found in lakes and reservoirs, canals and rivers, ditches and runnels,—in short, in any collection of water containing suitable food. The great majority live in fresh water, yet many are seldom met with except in water either brackish or alkaline, and some are restricted to sea water. Many flourish in places only intermittently wet, such as among the stems of land-growing mosses and liverworts. Some are parasitic within the cells of water plants, or the bodies of other larger water animals, living even in the gill-chambers of fresh-water crabs and crayfish. Others are literally "hangers-on" to the leaves and stems of water weeds for the sake of a favourable position, or to the exteriors of water animals for the benefit of constant change of surroundings as their hosts move about. While they mostly live in waters of moderate temperature, they have been found established in hot springs. They can endure intense cold, being capable of reviving after being frozen in thick ice. Some appear only in the spring and summer, others carry on through the winter as well.

FIG. 1.—A WHELLOID ROTIFER (*PHILODINA ACUTICORNIS*)

Whatever the variations of their outward form, an arched back and a flattened ventral surface, two similar sides and a division of the body into head, trunk and foot, by shallow constrictions, can in general be readily distinguished, though the head is often merged into the trunk, and there is frequently no foot. The whole may be maggot-shaped, slender or elongate, ovoid or squat. Especially diversified in form are those species in which the skin is hardened to become an armourlike covering (lorica) which may be much flattened or laterally compressed. While mostly smooth and hyaline, the surface may be shagreened, faceted, grooved or otherwise obscured. It may carry defensive spines, supplemented by numerous prickles. It may consist of one or of several pieces connected by yielding skin. In species without a lorica, the skin is generally smooth and flexible, but is sometimes tough and leathery, and may carry spines. The head, trunk and foot are often subdivided into smaller areas, segments or joints, by annular infoldings of the skin, frequently permitting the telescoping of one segment into that next to it.

Corona.—The collection of food and the swimming and gliding movements of rotifers are effected by the lashing action of numerous cilia crowded upon a particular area of delicate skin close to or encircling the mouth, or fringing several fleshy lobes or discs protrusible from it. The whole area, including the mouth itself, as seen when the cilia are active, is called the corona, and there are many varieties of the organ, differing widely in the arrangement of the cilia, etc. All these may be assigned to two leading types, the external and the everted. In the main, the external type is characteristic of the hunting rotifers, which go about,

ROTIFER GROUP SEEN THROUGH A MICROSCOPE

General view of the marine inhabitants found in one-half inch of pond-bottom. Rotifers are invisible to the human eye and this group represented is magnified one hundred diameters. The rotifers are the most numerous and the group is a survey of the bladder-worm (Triton) fish-eating water plant which occupies tiny rotifers and other creatures by means of its bladder-shaped traps spread diagonally across the field of vision.

BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

ROTIFER GROUP SHOWING MINUTE INHABITANTS OF A POND

Detail of microscopic life found in $\frac{1}{2}$ in. of pond-bottom. The bladderwort (*Utricularia vulgaris*), a water plant, is seen on the right, showing a single "utricle" about the size of a pin head in the living plant. At its upper right margin is a trap door, with a captured rotifer visible inside. The stem is covered with tiny algae. At the top, approximately in the centre, is shown a spherical colony of rotifers (*Conochilus hippocrepus*). Below it, together by their stems, and below it, centre bottom, is a crescent-shaped beard (*Chlorostemon*).

swimming or gliding, in search of their food. The mouth is generally a little below the centre of the convex front of the head and the ciliated area, sometimes extending over various prominences, may be mainly before or mostly behind it. In certain species which only swim feebly by their ordinary cilia, these are often supplemented by auricles, small evertile pouches, one on each side of the head, lined with more powerful cilia. When the pouches are everted, these stronger cilia drive the rotifer along at greatly augmented speed. Other species rely almost entirely on their auricles. Certain footless species possess, besides the corona, from 2 to 12 leaping spines, attached to the "shoulders," which enable them, in emergencies, to spring suddenly several times their own length. In *Pedalia*, these spines are replaced by six limbs, having flattened ends fringed with stiff bristles.

The corona is much more complicated in the evertile type, characteristic of the stationary or sessile, and of the bdelloid rotifers, two groups very different otherwise, but alike in that they do not solely forth to seek their food, but wait for it to be brought to them by external currents or by those set up by themselves. The sessile rotifers are unique among the class in having an immature stage, lasting some days. When hatched, the young animals, little resembling their parents, and having a very simple corona, swim about for a while. Having chosen a position they affix themselves (for life) by the foot, and as they grow, develop the evertile corona proper to the adult. They are mostly independent, but certain of them form communities by affixing themselves, when young, close to others. Sometimes such communities are attached to plant stems, sometimes they are free, the animals radiating from a common centre, and the community swimming through the water as a revolving sphere.

The ciliated area is mostly disposed as a band fringing a shallow disc-like expansion, rounded, elliptic, heart-shaped, or two-, four-, or eight-lobed, into which the head opens as the corona unfolds. In one family the whole head opens out as a cup whose rim is drawn out into lobes beset with long hairlike setae arranged to form a living net, wherein the animals can draw their prey by the influence of cilia hidden in the depth of the cup. In one of the most beautiful of such forms, the "crown animalcule" (*Stephanoceros ambriatus*), the rim is drawn out into erect arms with approximating tips and furnished with regularly placed tufts of cilia, closing the gaps between the arms and so forming a trap.

Among the bdelloids the corona consists mainly of two discs usually distinct, surmounting short pedicels arising from the back of the gaping mouth. The discs can be employed for swimming and for feeding while swimming, but most species feed when anchored by the foot, and when they desire to travel usually creep in leechlike manner; some exceptional species however, swim continuously, and some can not swim at all.

In the typical form of the evertile corona, the cilia of the band fringing the upper surface of the lobes or discs are conspicuous and constitute the *trochus*. Almost parallel with it is another band, of much shorter cilia, the *cingulum*. Among the sessile species it passes round the under edge of the lobes or discs, and in the Bdelloids, round the bases of the pedicels and so to and around the lower lip on the inside, merging into the cilia of the mouth. Particles floating within reach of the trochus-cilia are struck by them within range of those of the cingulum, which in turn impel them to the mouth to be swallowed.

A curious illusory appearance of cogged wheels in rapid revolution, which greatly puzzled the early microscopists, is caused by the trochus-cilia. It happened that species showing this appearance were among the first rotifers discovered and that a long period elapsed before it was satisfactorily explained. Meanwhile it had led to all the known species being called "wheel animalcules" and thus to the later name of Rotifera (wheel-bearers) here employed. It is now believed that a succession of nerve-impulses, following each other at short and regular intervals, travel along the protoplasmic bases of the cilia, causing each of them, when reached, to lash violently downward.

Among the many-segmented bdelloids, the first two segments form the rostrum, a structure peculiar to the group; the rostral tip, specially adapted, is employed to affix the body when creeping, the mouth, on the third or oral segment, being then closed with the corona hidden within. When it is desired to feed or to swim, the mouth is opened, the corona pushed forth, and the rostrum, in a collapsed condition, is thrust to the back and kept there while the corona continues active.

Mastax.—The food of rotifers consists in most cases of floating particles, excessively minute fragments of plant or animal tissues, bacteria, etc., but there are numerous exceptions. Many of the hunting rotifers will pounce upon weaker forms and gulp them down, tear them to shreds or suck out the soft interiors. Others successfully attack small Cladocera, such as *Chydorus*, and test-dwelling waterpods are sometimes invaded and eaten. The contents of a rat-snail's egg or of coniferoid cells are obtained by piercing the investing shell or cell-wall. Diatoms, swallowed whole, are a favourite food of many forms and the smaller flagellates are also in request. Among the sessile rotifers the trap-making species prey upon the lesser animalcules and also upon flagellates. When secured, the food is passed down a short, distensible gullet to the mastax, or jaws.

Important as are the functions of the mastax, they are by no means identical throughout the Rotifera, and the general plan of the organ has been very greatly modified in the various series of species according to the requirements of their respective habits of life. In itself the mastax is a complicated arrangement of seven principal hardened parts (adapted for biting, cutting, holding and crushing), of powerful muscles, of controlling nerves and tiny glands, all enclosed in a stout-walled chamber, into whose upper cavity the food is carried. Each hardened part varies greatly in size, shape and relative prominence in the combination, and the parts that are dominant in the mastaces of one series of species may be of secondary importance or even suppressed, in those of another series.

The different forms of the mastax have been grouped under six leading types.

In the malleate type, figured in ventral aspect (fig. 5), the seven hardened parts are all present and of average development. In the centre is the *incus*, or anvil, comprising the *fulcrum*, or base (now viewed edgewise), to whose upper portion are hinged two *rami*, or branches, flattened parts whose free ends, mostly directed upward, open and shut like shears. In lateral view, the fulcrum appears as a moderately wide plate. It is secured strongly to the mastax wall and has no independent motion. Outside the rami, to right and left and further dorsward, are two *mallei*, or hammers, each comprising a *manubrium*, or handle, nearly perpendicular, and an *uncus*, or striker, bent sharply inward toward its fellow, and often ending in fingerlike teeth. The two rami move in unison, as do also the two mallei, but generally independently of the rami. Only the two unci and the two rami come in contact with the food. This type of mastax obtains among numerous species of the hunting rotifers.

The other types can only be briefly indicated. In the virgate type, adapted for pumping, the manubria and the fulcrum are both elongate; the canal being distended, and its wall being sup-

FIG. 2.—A PELLET MAKING BDELOID ROTIFER (HABROTRICHA LATA)

FIG. 3.—A HUNTING ROTIFER (MICROCODON CLAVUS)

FIG. 4.—A SESSILE ROTIFER (PTYGURA STYGIS)

ported by the hardened parts, a piston is supplied by a muscle. In the incudate, or seizing type, the whole incus (but especially the rami), is extremely developed; in the ramate, or bruising type, the unci are divided into several teeth and the fulcrum is reduced. The uncinatate, or tearing type, has both manubria and fulcrum greatly reduced, while in the forcipate type, having somewhat elongate jaws, the mastax can be thrust forth from the mouth for at least half its length.

Stomach.—From the mastax the food passes next by a usually short oesophagus to the stomach, a fairly capacious organ, occupying in general a large part of the body cavity. It has a stout wall lined with cuticle, mostly ciliated, and on the outside a strong elastic covering. Between these is a dense layer of granular tissue, often divided into conspicuous cells and containing many oil globules. The interior of the stomach is mostly baglike, but in the bdelloid group it is generally narrowly tubular with a very thick wall and is baglike only in certain species, known as pellet makers, because, in their case, while the food passes through the oesophagus, it is agglutinated into small pellets before entry into the stomach. Though fairly numerous, such species are mostly small and dwell in mosses.

In one small group of hunting rotifers the stomach is blind and the undigested residue of food is returned to the mouth for ejection. In others the stomach is divided into two portions, the lower of which functions as intestine, but usually that organ is a separate dilation of the food canal, following closely behind the stomach, and much smaller, with thinner walls. Thence the residue passes through a short cloaca to the dorsally placed anus, whose position marks generally the hinder limit of the trunk. A pair, or more, of small glands, which secrete digestive juices, are linked to the food canal near its entrance into the stomach.

Foot.—The foot has mostly a secondary role and many species get on very well without one. In others it is highly important and is frequently longer than the remainder of the body, serving for some as a rudder, for others as a balancer, or as a highly contractile stalk. In loricated species and in some others, its cuticle is mostly hardened and divided off into several segments, sometimes telescopically retractile. In certain species the skin covering the muscular and very flexible core of the foot falls into numerous annular wrinkles.

Among the sessile group the foot commonly ends in a blunt point by which the rotifer can attach itself in any selected position. Among other forms the extremity most frequently carries one, two, or more processes, known as toes, having great variety of form and diversity of function. There are two distinct types, one having a single piece, the other having two, the lower retractile within the upper. The latter type is normal among bdelloid species, which have two, three or four toes, but in some they are replaced by a kind of sucking disc. Among the hunting rotifers, the toes are always of one piece, sometimes furnished with somewhat clawlike tips. While many have but one, there are generally two, which may be alike in size and form, or very dissimilar. They may be straight, decurved or recurved, short or exceedingly long, slender or stout. Both types are hollow, with perforate tips, from which exudes a viscid secretion brought by tiny ducts from two glands in the upper foot, or lower trunk. By this secretion, the toes, or the sucking disc, or the blunt point of the sessile foot, are attached to any surface touched, but can be freed at will. Among the bdelloids, the second last segment has two dorsal processes resembling the toes of the hunting rotifers and called spurs to distinguish them. They are mostly short yet very much in shape and pose.

Nervous System.—A nervous system is well developed. Within the head lies a large ganglion, or brain, which is mostly of flattened form. From thence nerve-threads pass down each side and to the eyes, the antennae and other sense-organs. The bdelloids and many of the hunting rotifers have a single antenna behind the head, sometimes of conspicuous length, but frequently very

FROM HEDDER IN THE "DEUTSCHES JOURNAL OF MICROSCOPICAL RESEARCH"
FIG. 5.—MALLEATE JAWS
OF HUNTING ROTIFERA
(BRACHIONUS SP.)

minute. Others of the latter group and many of the sessile forms have two antennae on the head, and certain loricated species have one antenna on the head, and two more to right and left further to the rear. Finally, several largish species are furnished with four distinct antennae. There are often two eyes, either in front of the head or behind the brain, but a single eye is more usual, and while there are occasionally three, many species have none. When examined the eyes show mostly a crystalline particle backed by ruby-red pigment. Among secondary sense-organs frequently present may be mentioned the trochal setae of the bdelloids, and the tactile setae of the Synchaetidae and allied forms. In many species, notably in the great family Notommatidae, there is conspicuous in close contact with the brain, the so-called retro-cerebral organ, of three principal parts, viz.—a central pendulous sac stretching some way behind the ganglion, having its interior filled with coarsely granular matter usually somewhat opaque, and flanked by two glands, sometimes larger, sometimes smaller, than the central sac. In many of the swimming species the organ has not been detected, and its function is not yet certain.

Excretion and Secretion.—An excretory system is represented by a very slender, much convoluted tube, which passes down each side of the body from the head rearward. To the tubes are attached at intervals by short stalks a series of minute "flame-cells," taglike in form, hollow and closed at the free end and enclosing a pulsating bunch of cilia. The tags, which usually number five to each tube, but in certain Asplanchnae are greatly in excess of this, are believed to draw out from the body the effete fluids, which are carried either to the cloaca or to a collapsible bladder near, whence they are discharged at short intervals.

Besides the special muscles, which operate the motions of the mastax, there are numerous sinews, which pass freely through the body, each having its own course and office, and operate the movements of the several parts of the rotifer, apart altogether from those arising from ciliary action. The illoricated species, bdelloids and others, have also an exceptionally interesting system of muscles, nesting close under the skin, and somewhat difficult to see, but controlling the skin tension.

When there is no lorica, the skin-pores of the trunk exude a secretion, frequently so viscid that debris, etc., readily adhere to it. Sometimes this becomes a close-fitting coat, but it may be made into a loose case, often of flasklike shape, enclosing the rotifer, which can protrude its head from the open end and feed when it pleases. Among the sessile forms slightly conical cases are made, often of gelatinous substance, sometimes hardened. In one well-known species the skin secretion is not employed, but by a special organ connected with the corona, the rotifer prepares small pellets of unswallowed particles, and with these builds, brick by brick, a more permanent dwelling.

Reproductive Organs.—More than four-fifths of the known species of Rotifera are represented only by females. The males of the others are in most cases extremely rare, much smaller and somewhat unlike their own females. They attract attention by their restless, rapid and seemingly aimless swimming. If one be examined, it will generally be found minus jaws, alimentary canal or bladder, but having a very simplified corona of rather long cilia, and as sex organs, a great sperm-sac, occupying much of the body, a seminal duct and mostly a protrusible penis. They survive a very few days. No male has yet been found among Bdelloids. As sex organs the females have only the two-fold ovary, usually conspicuous in the trunk. The larger part, the yolk-mass, contains generally eight large nuclei and produces yolk material; the smaller and separated part, the germ-mass, containing germ-cells. Among the bdelloids and a small series of marine parasitic forms, there are two such ovaries; in all others one only. The combined organ is usually of ovoid shape, rarely elongate and bandlike. From the ovary a long, collapsible tube leads to the cloaca.

Reproduction is in general oviparous, sometimes ovoviviparous, the eggs being retained until the embryos are well advanced. Three kinds of eggs are produced, always by different females, (1) unfertilized or parthenogenetic, hatching in a few days, having a thin shell, and producing females (see PARTHENOGENESIS); (2)

male, much smaller, also thin-shelled and parthenogenetic, hatching promptly and producing males; (3) resting, as large as the unfertilized eggs but with a stouter shell, requiring fertilization and not hatching for a protracted period and then producing females, which later develop the ordinary unfertilized eggs. By means of the resting eggs, the species is carried over a danger period. Fertilization is internal; the males of certain species possess intromittent organs, but in other cases, the body-wall of the female is penetrated. The spermatozoa may be very large and in some species superficially resemble trypanosomes. (W. T. C.)

Ecology and Distribution.—The rotifers are among the most common fresh-water animals, living in almost any type of fresh-water habitat from hot springs with temperatures as high as 46°C. to arctic and antarctic ponds where they are frozen for the greater part of the year. Certain types of bdelloids can withstand extreme desiccation lasting for weeks or months. On drying, they contract into the smallest possible volume and lose all but a minute trace of water, but there is no secretion of a protective cyst.

Most species of rotifers are cosmopolitan, but some probably have a limited distribution determined by the chemical and physical properties of the habitat.

The fresh-water rotifers are divisible into benthic, limnetic and sessile types. The benthic types, mostly of moderately elongated form with normal foot, crawl or swim about near the bottom or among aquatic plants, feeding on small organisms, or algae, diatoms and detritus. The limnetic rotifers, characteristic of the open waters of ponds and lakes throughout the world, exhibit certain common features as transparency; stout or saciform shape; loss, reduction, or ventral displacement of the foot; carnivorous habits with grasping type of maxillae; and occurrence of spines or other projections to lend buoyancy. Many limnetic rotifers, as species of *Keratella*, *Brachionus*, *Notholca* and *Asplanchna*, occur in a number of form varieties, with regard to length of spines and to body and head shape, and these may show cyclic recurrence in relation to seasonal conditions. The sessile rotifers such as *Floscularia*, *Collotheca*, *Stephanoceros*, etc., live attached throughout adult life to water plants and other objects. Their elegant trumpet form, with long stalklike foot and anterior end expanded into a circular, oval or lobed disc or cup, makes them among the most admired of microscopic objects (fig. 4). They feed on minute particles brought in by ciliary currents or on animals trapped in the cup. Besides these main ecological types, there are also common rotifers that habitually live in or on specific animals or plants and a few endoparasites with reduced corona inhabiting the intestine of annelid worms and slugs. (L. H. H.)

SYSTEMATIC AFFINITIES

The systematic affinities of the Rotifera have been much discussed without any general measure of agreement being arrived at. Since C. G. Ehrenberg in 1838 distinguished them from the ciliate Protozoa they have been approximated in turn to nearly every one of the major divisions of the animal kingdom except the Chordata. In 1851 Huxley compared them with the free-swimming ciliated larvae of Annelids and, more particularly, of Echinoderms. In 1858, Seep's discovery of *Trochospira* gave fresh support to the comparison with the ciliated larvae of Annelids and for the first time the view that the Rotifera were persistent trochophore forms was said to have held the field. In 1871 *Pedalion* was described by Hudson, and this remarkable form with its three pairs of hollow limbs moved by muscles, giving it a superficial resemblance to a crustacean Nauplius larva, revived an older view that the Rotifera were in some way related to the Arthropoda. E. R. Lankester included them with the Annelida and Arthropoda in his phylum Appendicularia. But the resemblances between *Trochospira* and the trochophore larva break down when examined in detail until little more is left than the common possession of a preoral ciliary wreath which they share with the Peritrichous Infusoria; and on the other hand the fact that two of the appendages of *Pedalion* are median and unpaired seems to preclude any close comparison with the other "Appendicularia." More recently C. Wesenberg-Lund and P. de Beauchamp have argued that the ciliary wreath is a secondary development and that the most primitive Rotifers are those like *Notommata* in which there is a ventral uniformly ciliated field surrounding the mouth. From these it is easy to pass to the ventrally ciliated *Gastrotrocha* and to imagine the derivation of both from a uniformly ciliated Turbellarianlike stock.

With organisms like the Rotifera, however, where paleontological aid give no help, phylogeny must remain a matter of speculation. All that we can be sure of is that they are unsegmented Metazoa without definite mesoderm or coelom, with branching excretory canals furnished

with flame-cells and having a single pre-oral nerve-ganglion. They are, therefore, on the same grade of organization as the Platyhelminths and the early larvae of several groups of higher Metazoa. It is likely that the exact arrangement of the locomotive appendages, whether ciliary or appendicular, is without any important phylogenetic significance. (W. T. C.)

CLASS ROTIFERA

Order 1. Seisonacea.—Rotifers of peculiar form, slender with long neck, inhabiting the marine crustacea. *Nebalia*; sexes of equal size and like form; ovaries paired. Example, *Seison*.

Order 2. Ploima.—Free-swimming rotifers of normal form, with undivided terminal or ventral corona, not consisting of trochal and circular ciliates; foot with usually two toes; ovary single; males more or less reduced in size and structure; maxillae various. Examples, *Notommata*, *Procladius*, *Synchaeta*, *Trichocerca*, *Euchlanis*, *Brachionus*, *Leptodora*, *Asplanchna*, etc.

Order 3. Flosculariacea.—Sessile or swimming rotifers, with more or less lobed corona of trochal and circular ciliates; toes lacking; maxillae malleolate; ovary single; males free-swimming, greatly reduced. Examples, *Floscularia* (= *Meliceria*), *Conochilus*, *Limnias*, *Pedalia*, *Filinia* (= *Triarthra*), *Trochospira*.

Order 4. Collothecacea.—Mostly sessile rotifers with large funnel-like corona, often lobed, lacking a ciliary border in some forms; maxillae uncinatae; toes wanting; ovary single; males free-swimming, greatly reduced. Examples, *Collotheca* (= *Floscularia*), *Stephanoceros*, *Cupelopagis* (= *Aspius*).

Order 5. Bdelloida.—Benthonic rotifers with jointed cuticle; both ends retractile into the trunk joints; corona of two trochal discs, set on pedicels, their bases encircled by the cingulum; two ovaries; maxillae ramate; toes often present; males wanting. Examples, *Philodina*, *Rotifer*, *Calidina*, *Habrotricha*.

ROTOGRAVURE: see PHOTOGRAVURE (MACHINE).

ROTOR SHIP. Wind propulsion for navigational purposes, in the commonly accepted sense, although suited for some particular trades, is practically obsolete for cargo carrying; and the sailing ship, pure and simple, cannot be said to have a definite future. Many sailing vessels are fitted with auxiliary propelling machinery, but, excluding fishing craft, these vessels have not proved an unqualified success.

Anton Flettner, the inventor of the rotor ship, originally intended to construct ships with metal sails, being convinced that the effect of metal sails is much greater than that of canvas sails. The idea was to build the metal sails with sections similar to those used in the construction of aircraft planes. It was intended that the sails should revolve freely around a pivot mast, and then be put by a special roller blade in such a position that the wind would drive the ship ahead.

Experiments were carried out at the University of Göttingen, Germany, with canvas sails, metal sails and model ships. The result of these experiments showed that the effect of metal sails could be made approximately double that of canvas sails, a necessary condition being, however, that a third part of the sail area should be turnable. Designs were got out, but the plans did not materialize.

In the case of the rotor ship the inventor states that it is not intended to drive ships solely by wind rotors, but that they shall serve as an auxiliary power upon steam and motor vessels. In the vessel under discussion, the power of the wind is not made use of by sails, but by means of large metal cylinders.

Revolving Cylinders.—In 1922 experiments were carried out at Göttingen with revolving cylinders, and it was then discovered that the pressure exerted upon a cylinder revolving in air

air current was considerably greater than had been supposed. Actually, the power exerted on a normal cylinder was about four or five times as large as that on a normal sail. When, however, discs of a larger diameter were provided at the ends of the cylinders, it was found possible to increase the effect to nine or ten times the amount of wind effect in the normal sail. One condition for this, however, is that the revolving speed of the cylinders is about 3 to 4½ times as great as that of the wind. An ordinary sailing vessel requires to take down all her canvas in a hurricane, but the rotor ship could continue sailing, with more stability for manœuvring.

The vessel selected for the first tests was the three-masted schooner "Buckau." She had a displacement of 960 tons, and was fitted with an auxiliary motor of some 200 horse-power. The canvas rig of the vessel was dismantled, and in place of the fore and third masts, two very strong masts were erected. The new masts were shorter, being 42 ft. in height. These masts were provided with bearings at the upper and lower ends to allow for the free rotation of the cylinders, which were placed over the masts. The cylinders were fitted with discs at either end, the discs being of greater diameter than the cylinders, but built as a part of them. In this particular case the cylinders are of sheet steel of 0.04 in. thickness.

Naturally, the whole structure is suitably stiffened. The cylinders are rotated by means of electromotors, which will give the towers a speed of 12 rev. per minute. Circumferential speed is approximately 60 ft. per sec., and the power required to rotate the towers is nine horse-power. For working the plant one man only at the switch-board is required. By altering the circumferential speed of one or other of the cylinders the operator can correspondingly change the pressure exerted by the wind upon this, and so alter the vessel's course. When cruising, changing the wind side can be effected solely by the towers, when the ship can be stopped and driven astern.

The Magnus-effect.—The explanation of the phenomenon of the rotor ship may be traced to the so-called *Magnus-effect*, explained in 1853 by Prof. Magnus of Berlin, who found that a special power is exerted by an air current upon a revolving cylinder. The explanation of the reason for this effect was found, after more than 20 years of investigation, to be briefly as follows: When a cylinder revolves, the nearest stratum of air revolves with the cylinder, owing to the friction of the cylinder being much greater than the friction of the air molecules against each other. The nearest stratum induces the next one also to revolve, but, naturally, this is done at a much slower speed. In the same manner the strata lying more distantly from the cylinder are moved more and more slowly, until at a certain distance the influence stops. If such a rotating cylinder is impinged upon by an air current, the speed of which is slower than the circumferential speed of the cylinder, the streamlines are directed, so that at one side the air is rarefied by the frictional effect of the cylinder, and at the other side it is compressed. These changes of pressure are the causes of the *Magnus-effect*, and they create a power in a direction away from the side of the rarefied air, and through the centre of the densest air patch, or side in which the streamlines are compressed. Actually the real direction of the power is not always at right angles to the wind direction, but diverges in a measure which is dependent on the speed ratio of the wind current to that of the circumferential speed of the cylinder.

The sea-going trial of the rotor ship "Buckau" from Germany to the North Sea, was claimed to be successful, but little has since been heard of the subject.

See *Marine Engineer Officers' Magazine* (Jan. 1925).

(F. J. D.)

ROTORUA, a town of Rotorua county, North Island, New Zealand. It lies in the midst of a remarkable volcanic district generally known as the Hot Spring district, which covers an area of 660 sq. m. and extends 160 m. from north-east to south-west from White Island, an active volcanic cone in the Bay of Plenty to the mountains of Tongariro, Ngauruhoe and Ruapehu in the interior of the island, S.W. of lake Taupo. Rotorua attracts many visitors on account of the beauty and scientific interest of the

locality and the bathing in its various medicinal springs. It is a scattered township lying on the south-western shore of lake Rotorua, amid hills reaching 2,600 ft. in the immediate neighbourhood, with a rich growth of forest. Pop. (1936) 6,531.

The springs are principally alkaline, alkaline and siliceous, acidic, or acidic and hepatic (sulphurous). The township includes the Maori village of Ohinemutu, an interesting collection of native dwellings. In the vicinity, on the lake-shore, is the government sanatorium. One mile south of the Rotorua is another native village, Whakarewarewa, where there are geysers as well as hot springs. Four miles from Rotorua, near the centre of the lake, the island of Mokoia rises to 1,518 ft. A short channel connects lake Rotorua with lake Rotiti to the N.E. Both this lake and the smaller ones to the east, Rotetohu and Rotomata, have deeply indented shores, and are set in exquisite scenery. The waters of Rotomata are of a particularly vivid blue. To the south of Rotiti is Tikitere, a sombre valley abounding in mud volcanoes, springs and other active volcanic phenomena. Mount Tarawera (16 m. S.E. of Rotorua) is noted for the eruption of June 1886, which changed the outline of several lakes, destroyed the famous Pink and White terraces on the adjoining lake Rotomahana.

ROTRON, JEAN DE (1609-1650), French tragic poet, born at Dreux on Aug. 29 or 30, 1609, became in 1632 playwright to the Hôtel de Bourgogne company. He was three years younger than Corneille, but began writing plays earlier than his great contemporary, for his first play *L'Hypochondriaque*, was printed in 1631. Most of his earlier plays were adaptations from the Spanish of Lope de Vega and by 1634 he is said to have produced 34 pieces. The importance of Rotron in French dramatic literature lies in the fact that he sought to naturalize the romantic English and Spanish comedy in France, where the tragedies of Seneca and the comedies of Terence were still the only accepted models. *Diane* (acted 1630; pr. 1633), *Les Occasions perdues* (acted 1631; pr. 1635), praised by Richelieu; and *L'Heureuse Constance* (acted 1631; pr. 1635); praised by Anne of Austria, were all in the Spanish manner, but in *Les Menchines* (pr. 1636), and in *Hercule Mourant* (pr. 1636) he followed the Latin authors Plautus and Seneca. In 1639 Rotron bought the post of *lieutenant particulier au bailliage* at Dreux, where he married and settled. His four masterpieces were written after that date; they are: *Le Véritable Saint Genest* (acted 1646; pr. 1648), a story of Christian martyrdom containing some amusing by-play, one noble speech and a good deal of dignified action; *Don Bertrand de Cabrère* (1647), a trag-comedy; *Venceslas* (1647; pr. 1648); *Corrois* (1649), a play with an oriental setting, claimed as the only absolutely original piece of Rotron. He died of the plague and was buried at Dreux on June 28, 1650.

A complete edition of Rotron was edited in five volumes by Viollet le Duc in 1822. In 1882 M. de Ronchaud published a handsome edition of six plays—*Saint Genest*, *Venceslas*, *Don Bertrand de Cabrère*, *Antigone*, *Hercule Mourant* and *Corrois*. See further J. Jarry, *Essai sur les oeuvres dramatiques de Jean Rotron* (Paris and Lille, 1868); Louise Person, *Hist. du Venceslas de Rotron, suivie de notes critiques et biographiques* (1882), in which many legends about Rotron are discredited; *Hist. du véritable Saint Genest de Rotron* (1882); *Les Papiers de Pierre Rotron de Sautreville* (1883); Henri Chardon, *La Vie de Rotron mieux connue* (1884); and Georg Steffens, *Jean de Rotron des Nachkammer Lope de Vega's* (1891).

ROTTERDAM, a city of the Netherlands in the province of South Holland, on both banks of the New Maas, at the confluence of the canalized Rotte, and a junction station 14½ mi. by rail S.S.E. of The Hague. The population of the city, the principal Dutch port, was about 20,000 in 1632; 53,212 in 1796; 105,858 in 1860; 379,017 in 1905 and 612,372 in 1940.

Rotterdam probably owes its existence to two castles, which existed in feudal times. In 1299 John I. count of Holland, granted to the people of Rotterdam the same rights as were enjoyed by the burghers of Beverwijk, which were identical with those of Haarlem (K. Hegel, *Städte und Gilden*, 1891, Bd. ii). This privilege marks the origin of the town. It continued to increase in size, various extensions of its boundaries being made, and its trading importance is to a large extent the result of its commercial intercourse with England. Its shipping facilities made it the first commercial city of Holland, and the third largest port on

the continent. By means of the New Waterway (1869-90) to the Hook of Holland it is accessible for the largest ships. Ships drawing 24 ft. can come up at any time, and those drawing 24 to 33 ft. at high water. The length of the quays is about 16 mi. The river is spanned by a road bridge (1878) and a railway bridge (1877) passing from the Boompjes to the North Island, whence they are continued to the farther shore by swing-bridges through which the largest ships can pass to the upper river. These bridges prove useful in breaking up the ice which forms above them in winter. On the south side of the river are numerous large docks and wharves, which were enlarged after World War I, while the city proper on the north side consists of a labyrinth of basins and canals with tree-bordered quays. These were bombed systematically by the Germans during the invasion of May 10-14, 1940, and later by the Allied air forces.

In the centre of the town is the Beursplein or Exchange square. Behind the exchange is the great market-place, built on vaulting over a canal, and containing a bronze statue of Erasmus, who was born in Rotterdam in 1467. The statue is the work of Hendrik de Keyser, and was erected in 1622 to replace an older one. Beyond the market-place is the High street, which runs along the top of the Maas dyke. On the west of the city a pretty road leads from the zoological gardens (1857), on the north to a small park, which contains a statue of the popular poet Hendrik Tollens (d. 1856), a native of the city. Among the churches of Rotterdam is an English church, originally built by the 1st duke of Marlborough, whose arms may be seen with the royal arms over the entrance. The Groote Kerk, or Laurens Kerk (end of the 15th century), contains a fine brass screen (1715), a celebrated organ with nearly 5,000 pipes, and the monuments of Admiral Witte de Witte (d. 1658), and other Dutch naval heroes. In the new market adjoining is a fountain adorned with sculptures erected in 1874 to commemorate the jubilee of the restoration of Dutch independence (1813). The museums of the city comprise an ethnographical museum, the maritime museum established by the yacht club in 1874, and the Boymans museum (1867) containing pictures, drawings and engravings, as well as the town library. Of the original collection of pictures bequeathed by F. J. O. Boymans in 1847, more than half was destroyed by fire in 1864; but the collection has been enlarged since and is representative of both ancient and modern artists. In 1935 the Boymans museum was erected outside the business centre of the city. It contains some of the most famous masterpieces of Dutch art and an extremely fine collection of old delft china. Close to the museum is a statue of the statesman Gysbert Karel van Hogendorp (1762-1834), a native of the city. Among the remaining buildings must be mentioned the old town hall (17th century; restored 1823), the new town hall, the concert-hall of the "Harmonic" club, the record office (1900), the *leeskabinet*, or subscription library and reading-rooms, and the ten-storied *Witte Huis* (1897), which is used for offices and is one of the highest private buildings on the continent.

On May 14, 1940, shortly after the Dutch had ceased resistance to the German invaders, enemy bombers completely destroyed the business centre of Rotterdam. An estimated 25,000-30,000 people were killed in the raid.

The industries comprise the manufacture of tobacco, cigars, margarine, rope, leather, etc., and there are breweries, distilleries and sugar refineries. Shipbuilding yards extend above and below the city, one of the earliest being that of the Netherlands Steamboat company (1825). It is, however, as a commercial rather than as a manufacturing city that Rotterdam became distinguished, its progress in this respect having been very striking. Between 1850 and 1902 the area of the port was increased from 96 to more than 300 acres.

Rotterdam ordinarily has a great transit trade of goods in bulk, and, besides its maritime trade, it has an extensive river traffic. Its overseas trade is principally with the Dutch colonies, New York, La Plata and the east and west coasts of Africa. The great harbour works on the south side of the river required to accommodate this growing trade were planned by Stieltjes (d. 1878).

ROTTWEIL, German town, in the Swabian Alps of Württemberg, on the Neckar, 46 mi. S.W. of Tübingen by rail. Pop. (1939) 12,977. In the 13th century Rottweil became a free imperial city and was subsequently the seat of an imperial court of law, the jurisdiction of which extended over Swabia, the Rhineland and Alsace. The functions of this tribunal came to an end in 1784. In 1803 Rottweil passed into the possession of Württemberg. It is partly surrounded by walls, and has a mediaeval town hall. The Gothic Heilige-Kreuz-kirche, built in the 14th century, was restored in 1840, and the Capellen-kirche has a Gothic spire.

ROTUMAHU: see PACIFIC ISLANDS: *The Third Arc*.

ROUBAIX, a manufacturing town of northern France, in the department of Nord, 6 mi. N.E. of Lille on the railway to Ghent. Pop. (1936) 106,742. Roubaix is about 1 mi. from the Belgian frontier on the Roubaix canal, which connects the lower Deule with the Scheldt by way of the Marq and the Esplanade. It unites with Wattrelos (pop. 29,095) to form a great industrial centre. The prosperity of Roubaix had its origin in the first factory franchise granted in 1466 by Charles the Bold, duke of Burgundy, to Peter, lord of Roubaix, a descendant of the royal house of Brittany. In the 18th century Roubaix suffered from the jealousy of Lille, of which it was a dependency, and not till the 19th century did its industries acquire importance. During World War I Roubaix was in the hands of the Germans, and the factories were emptied. As the mills were largely spared, work was started again with government help and bank credits in 1919.

The chief business is the woollen manufacture, but cotton, silk and other materials are also produced. The chief of these are fancy and figured stuffs for garments, velvet and upholstering fabrics. There are wool-combing and wool-dressing works, spinning and weaving mills, dyehouses and printing works, rubber-works, metal foundries and machinery works in the town.

ROUBILLAC (more correctly **ROUBILLAC**), **LOUIS FRANÇOIS** (1695-1762), French sculptor, was born at Lyons and became a pupil of Balthasar of Dresden and of N. Coustou. It is generally stated that he settled in London about 1720, but as he took the second grand prize for sculpture in 1730, while still a pupil of Coustou, it is unlikely that he visited England at an earlier date. The date 1744, as given by Dusseux, is incorrect. He was at once patronized by Walpole and soon became the most popular sculptor in England, superseding the success of the Fleming Rysbrack and even of Scheemakers. He died on the 11th of January 1762, and was buried in the church of St. Martin-in-the-Fields. Roubillac was largely employed for portrait statues and busts, and especially for sepulchral monuments. His chief works in Westminster abbey are the monuments of Handel, Admiral Warren, Marshal Wade, Mrs. Nightingale and notably that of the duke of Argyll, which established his fame. He possessed skill in portraiture and was technically a master, but lived at a time when his art had sunk to a low ebb. His figures are frequently uneasy, devoid of dignity and sculptural breadth, and his draperies treated in a manner more suited to painting than sculpture. There are, however, noteworthy exceptions, his bust of Pope, for example, reaching a high standard.

His most celebrated work, the Nightingale monument, in Westminster abbey, a marvel of technical skill, is saved from being ludicrous by its ghastly and even impressive hideousness. The celebrated bust of Shakespeare, known as the Davenant bust, in the possession of the Garrick Club, London, is his.

ROUBLE. The rouble is the monetary unit of Russia (U.S.S.R.). It is divided into 100 kopecks, and is either gold, silver or paper. Kopecks are either silver, bronze or copper. The par of exchange with sterling before World War I was: R.10=21s. 2d. The main currency in circulation between 1863 and 1921 was credit notes issued by the state bank. Towards the end of the

19th century, these depreciated sharply in relation to gold. A law of 1897 stabilized the paper rouble at 66½ kopecks in gold. The credit note was maintained at this ratio until World War I. On July 1, 1914, there were 500,000,000 gold roubles, 230,000,000 silver roubles and 1,630,000,000 roubles in credit notes in circulation. The gold cover was higher than 100%, and under normal conditions the monetary system would have been stable. But Russia, like certain other countries, faced with huge expenditures in connection with financing the war, resorted to the issue of paper money. The resultant inflation ruined the stability of the monetary system. By the end of 1915, 9,097,000,000 roubles were in circulation, and on Nov. 1, 1917, some 19,000,000,000 roubles (paper money) with a gold cover of one-fifth of their value.

Under the influence of war and revolution, followed by economic chaos, inflation developed at a terrific pace, and the value of the paper rouble fell catastrophically. By Jan. 1, 1921, the total issue of paper money had reached 1,168,000,000,000 roubles and on Oct. 1, 1921, 4,529,428,000,000 roubles. In 1921, the soviet government introduced the "new economic policy," one of the most important achievements of which was the creation of a stable monetary system and the restoration of the state bank. The monetary reform was accomplished in two stages. On Oct. 11, 1922, the state bank created a new currency—the *chervonets*. The chervonetz was equal to ten prewar roubles, and its fine gold content was established at 7.74234 grams. The notes were issued in denominations of 1, 3, 5, 10, 25 and 50 chervontsi. The obligatory cover was established at 25% gold, platinum or stable foreign currency, and 75% in easily realizable commodities, short-term bills and other short-term bonds. Simultaneously, the old paper currency was maintained in circulation. As compared with the chervonetz, its value fell steadily. On March 10, 1924, the rate of redemption was defined at 50,000,000,000 roubles of the old denomination in one rouble in gold, i.e., one chervonetz rouble. The depreciation of the old rouble created instability in the budget and in the entire economy. Between February and June 1924, a series of decrees was passed constituting the second phase of the monetary reform. The old soviet rouble was withdrawn from circulation by means of an exchange on fixed rates against the new treasury roubles, issued in denominations of 1, 3 and 5 roubles. The new rouble was made legal tender. The volume of issue of the treasury roubles was limited to no higher than 50% of the chervontsi in circulation.

Towards the end of 1924, a ratio of ten new roubles to the chervonetz was established, and after that the monetary system consisted of chervontsi (bank notes), paper roubles (treasury notes) and various coins. On Oct. 1, 1924, the currency in circulation totalled 49,000,000 roubles in silver, 346,000,000 in bank notes and 202,000,000 in treasury notes. This made a total circulation, including various small coinage, of 622,000,000 roubles.

After the reform of 1924, the monetary system in the soviet union acquired a stable character. Although on several occasions (1926, 1928, 1930, 1933) the stepping-up in the issuing of notes for financing industrialization, collectivization and defense industry caused inflationary fluctuations of the rouble, on the whole, the monetary system remained unshaken and the soviet government, through relatively speedy control measures, maintained the rate of the rouble. After the monetary reform, there was further established in the U.S.S.R. a system of stable deficitless budget. On April 1, 1936, after the devaluation of world currencies (the dollar and the pound), the soviet government established the fine gold content of the rouble at 0.1776 grams, instead of 0.77423 grams as theretofore. The total amount of money in circulation on Jan. 1, 1937, was 11,255,000,000 roubles, including 8,020,000,000 roubles in state bank notes, 2,801,000,000 roubles in treasury notes and 435,000,000 in coin. The strengthening of the economic system (monopoly of foreign trade, prohibition upon the export of currency, stabilization of the budget system, introduction of domestic checking accounts, strict regulation of the volume of merchandise and money in circulation), and, to a certain extent, the rapid growth of gold production, all contributed to the strengthening of the soviet monetary system. Although the soviet rouble is not quoted on the world stock exchange, its stability at home made it possible to finance the five-year plans of industrial-

ization and to increase the soviet union's defensive capacity. The commissariat of finance periodically publishes the official foreign exchange rates, according to which it conducts payments on foreign trade. In order to arrest inflation which had developed in the U.S.S.R. during World War II, the Soviet government on Dec. 14, 1947, established a new currency; one new rouble was exchanged for ten roubles of the old currency. Under the revaluation of the rouble of Feb. 28, 1950, the rate of exchange was set at 11.20 to the pound sterling and 4.00 to the U.S. dollar. (See also RUSSIA: *Economic and Financial Conditions*.) A. A. Y.; X.)

ROUEN, a city of France, capital of the department of Seine-Inférieure and the ancient capital of the province of Normandy, on the Seine, 87 mi. N.W. of Paris by rail. Pop. (1946) 107,739.

History.—*Ratuna* or *Ratumacus*, the Celtic name of Rouen, was modified by the Romans into *Rotomagus*, and by the writers of mediaeval Latin into *Rodomum*, of which the present name is a corruption. Under Caesar and the early emperors the town was the capital of the Vellocasses, and it did not attain to any eminence till it was made the centre of Lugdunensis Secunda at the close of the 3rd century, and later the seat of an archbishop. Rouen owed much to its first bishops—from St. Mello, the apostle of the region, who flourished about 260, to St. Remigius, who died in 772.

Under Louis le Débonnaire and his successors, the Normans several times sacked the city, but after the treaty of St. Clair-sur-Epte in 912, Rouen became the capital of Normandy and the principal residence of the dukes. In 1087 William the Conqueror, mortally wounded at Mantes, died at Rouen. The succeeding Norman kings of England tended to neglect Rouen in favour of Caen and afterwards of Poitiers, Le Mans and Angers; but it maintained an importance during the 12th century indicated by the building of churches, notably that of St. Ouen. In 1203 Rouen was the scene of the murder of Arthur of Brittany at the hands of King John of England. Ostensibly to avenge the crime, Philip Augustus invaded Normandy and entered the capital unopposed. Philip confirmed its communal privileges and built a new castle.

A convention between the merchants of Rouen and those of Paris relating to the navigation of the Seine was followed by treaties with London, with the Hanseatic towns and with Flanders and Champagne. In 1302 the seat of the exchequer or sovereign court, afterward the parlement, of Normandy was definitely fixed at Rouen. A stubborn resistance was offered to Henry V of England, who after a long siege occupied the town in 1419. The prosperity of Rouen continued under the English domination, and during this period the greater part of the church of St. Ouen was constructed. In 1431 Joan of Arc was tried and burned in the city. From that year the French began attempts to recapture the town, which they did in 1449. During the close of the 15th century and the first half of the 16th, Rouen was a metropolis of art and taste. In 1562 the town was sacked by the Protestants. This did not prevent the league from gaining so firm a footing there that Henry IV besieged it unsuccessfully, and only obtained entrance after his abjuration. The revocation of the edict of Nantes in 1685 greatly affected Rouen. During the Franco-German War the city was occupied by the invaders from Dec. 1870 till July 1871. In World War I Rouen played a great part in the supporting organization of the British army in France.

Monuments.—The old city lies on the north bank of the river in an amphitheatre formed by the hills which border the Seine valley. It is surrounded by the suburbs of Martainville, St. Hilaire, Beauvoisine, Bouvreuil and Cauchoise; 2½ mi. east is the industrial town of Darnétal (pop. 1946, 7,604), and on the opposite bank of the Seine is the manufacturing suburb of St. Sever with the industrial towns of Sotteville (pop. 18,469) and Le Petit Quevilly (pop. 19,953) in its immediate neighbourhood. Finally in the centre of the river, northeast of St. Sever, is the Ile Lacroix, which also forms part of Rouen. Communication across the Seine is maintained by three bridges, including a *pont transbordeur*, or moving platform, slung between two lofty columns and propelled by electricity. The central point of the old town is the *Place de l'Hôtel de Ville*, occupied by the church of St. Ouen and the *hôtel de ville*.

The cathedral was built on the site of a previous cathedral

burned in 1200, and its construction lasted from the beginning of the 13th century (lateral doors of the west portal), to the beginning of the 16th century (Tour de Beurre). The western façade belongs, as a whole, to the Flamboyant style. But the northern tower, the Tour St. Romain, is in the main of the 12th century, its upper stage having been added later. The southern tower, the Tour de Beurre, so named because funds for its building were given in return for the permission to eat butter in Lent, is of a type essentially Norman, and consists of a square tower pierced by high mullioned windows and surmounted by a low, octagonal structure, with a balustrade and pinnacles. These contrasted towers are the most striking feature of the wide façade. The portals of the transept are each flanked by two towers. The most remarkable part of the interior is the Lady Chapel (1302-20) behind the choir with the tombs (1518-25) of Cardinal Georges d'Amboise and his nephew, the statuary of which is of the finest Renaissance workmanship. Behind the cathedral is the archiepiscopal palace, a building of the 14th and 15th centuries.

St. Ouen was formerly the church of an abbey dating to the Roman period and reorganized by Archbishop St. Ouen in the 7th century. It was founded in 1318 in place of a Romanesque church which previously occupied the site and of which the only relic is the chapel in the south transept. The choir alone was built in the 14th century. The nave of the church belongs to the 15th century, by the end of which the central tower with its octagonal lantern and four flanking turrets had been erected. The western façade dates from 1846. The large stained glass windows are of the 14th, 15th and 16th centuries. The Portail des Marmousets, the entrance to the south transept, has a projecting porch, behind and above which rises a magnificent rose window. The north façade has no entrance.

The church of St. Maclou, behind the cathedral, begun in 1437 and finished early in the 16th century, is a rich example of the Flamboyant style, and has a rich portal with five arched openings. It is celebrated for carving attributed to Jean Goujon.

The church of St. Vincent, near the Seine, is a building of the 16th century and contains very fine stained-glass windows at the end of the north aisle, by Engstrand and Jean le Prince, artists of Beauvais. The stained glass in the churches of St. Patrice (16th century) and St. Godard (late 15th century) is inferior only to that of St. Vincent.

The most important secular building in Rouen is the Palais de Justice, once the seat of the exchequer and later, of the *parlement* of Normandy. It is in the late Gothic style and consists of a main building flanked by two wings. The left wing, known as the Salle des Procureurs, was built in 1493 and has a lofty barrel-roof of timber. South of the Palais de Justice is the Porte de la Grosse Horloge, an arcade spanning the street and surmounted by a large clock of the 15th century with two dials. The Tour de la Grosse Horloge, which rises beside the arcade, was built in 1389. The tower known as the Tour de Jeanne d'Arc was the scene of her trial, and is all that remains of the castle built by Philip Augustus early in the 13th century. The Porte Guillaume-Lion, opening on to the Quai de Paris, is a handsome gateway built in 1749.

Rouen is the seat of an archbishop, a prefect, a court of appeal and a court of assizes, and headquarters of the III. army corps. Its public institutions also include a tribunal of first instance, tribunals of commerce and of maritime commerce, a board of trade-arbitrators and a chamber of commerce. All the more important nations have consulates in the city.

Rouen is an important centre for trade in wines, spirits, grain and cattle. Grain, wine, coal, timber and petroleum are leading imports. Besides its manufactures it exports plaster and sand. The principal industries of Rouen and its district are the spinning and weaving of cotton, notably the manufacture of *rouenneries* (cotton fabric woven with dyed yarn), the printing and dyeing of the manufactured material and the spinning of other fibres; ship-building and the making of various articles of clothing are also carried on, and there are distilleries, petroleum-refineries and manufacturing of chemicals, soap, machinery, curd-combs and brushes. The port of Rouen comprises the marine docks below the Boileudieu bridge, and the river dock, the timber dock and the

petroleum dock above it. There is also a repairing dock. The Seine is tidal beyond Rouen. The port is accessible for ships drawing 19½ to 25 ft. of water, and its quays have a superficial area of about 194 acres. It is served by the lines of the Orléans, the Ouest-Etat and the Northern railways and these, in addition to the waterways connected with the Seine, make Rouen a convenient centre for the distribution of merchandise.

See A. Chervel, *Histoire de Rouen pendant l'époque communale* (Rouen, 1843); *id.*, *Sous la domination anglaise* (Rouen, 1840); C. Bahrt, *Rouen* (Paris, 1904); J. Levalainville, *Rouen*.

ROUERGUE, formerly a French province, derives its name from the Gallic tribe of the *Rutheni*. It was bounded on the north by Auvergne, on the south and south-west by Languedoc, on the east by Gévaudan and the Cévennes and on the west by Quercy. It included (1) the county of Rodez, (2) Haute and Basse Marche; and it was divided between the dioceses of Rodez and Vabres (province d'Alby after this province had been separated from that of Bourges in 1678). Administratively it formed first a *sénéchaussée*, dependent on Languedoc (capital Villefranche, in the Basse Marche), and later it was attached to the military governments of Guienne and Gascony. It was then part of the departments of Aveyron and of Tarn-et-Garonne.

ROUGE, a French name applied to various colouring substances of a brilliant carmine tint, especially when used as cosmetics. The best of these preparations have for their basis carthamine, obtained from the safflower (*q.v.*), *Carthamus tinctorius*. (See COLOURS; PAINTS, CHEMISTRY OF; COSMETICS.)

ROUGET DE LISLE, CLAUDE JOSEPH (1760-1836), French author, was born on May 10, 1760, at Lons-le-Saunier (Jura). He entered the army as an engineer, and attained the rank of captain. The song which has immortalized him, the *Marseillaise*, was composed at Strasbourg, where Rouget de Lisle was quartered in April 1792. He wrote both words and music in a fit of patriotic excitement after a public dinner. The piece was at first called *Chant de guerre de l'armée du Rhin*, and only received its name of *Marseillaise* from its adoption by the Provençal volunteers whom Barbaroux introduced into Paris, and who were prominent in the storming of the Tuilleries. The author was a moderate republican, and was cashiered and thrown into prison; but the counter-revolution set him at liberty. He died at Choisy-le-Roi (Seine et Oise) on June 26, 1836. Rouget de Lisle published *Chants français* (1825), in which he set to music fifty songs by various authors. His *Essais en vers et en prose* (1797) contains the *Marseillaise*, a prose tale of the sentimental kind called *Adelaide et Monville*, and some occasional poems.

See J. Tiersot, *Histoire de la Marseillaise: œuvres musicales de Rouget de Lisle* (1915).

ROUGH CAST, in architecture, a term used in England for any stucco or mortar combined with gravel and sand, employed as the finishing coat of covering plaster over a rough structure of masonry, and frequently decorated by the addition of pebbles of different colours, or even small pieces of glass. In American usage the term is limited to the rougher textures of a stucco surface, obtained either by throwing on the finished coat in unequal masses or by sprinkling over the finished surface, while still wet, a coating of coloured pebbles, tile or brick fragments, marble chips, etc.

ROUHER, EUGÈNE (1814-1884), French statesman, was born at Riom (Puy-de-Dôme) on Nov. 30, 1814. He entered the Chamber in his native department in 1848, and held office from 1849, with short intervals, until 1852. Napoleon entrusted him (1851) with the redaction of the new Constitution, and made him (1852) vice-president of the Council of State. As minister of agriculture, commerce and public works, from 1855 onwards, he greatly improved the economic situation of France, and in 1863 became minister president. He resigned in 1867, but shortly afterwards resumed office as finance minister. After the fall of the Empire he fled to England, but returned to France in 1872 to work for the interests of the Prince Imperial. He returned to the Chamber as deputy of Ajaccio, and, later, sat for Riom. After the death of the Prince Imperial, Rouher supported the claims of Prince Napoleon, son of the ex-king Jerome. He died on Feb. 3, 1884. (See the references under NAPOLEON III.)

ROULERS, a town in the province of West Flanders, Belgium, 13 mi. N.W. of Courtrai on the Mandel. Its Flemish name is Rocsselaere. Pop. (1947) 31,839. Its weavers were already famous in the 17th-18th centuries and the neighbourhood cultivates flax. Lace, carpets and linen are manufactured.

ROULETTE, a gambling game of French origin, is played in nearly all gambling casinos of Europe and America. It is principally identified with the gaming rooms at Monte Carlo, but elsewhere it has been superseded by other games (in the U.S., principally craps; see *DICE*) among those who gamble for large sums. Countless systems have been devised for winning at roulette, but none is of demonstrable mathematical efficacy and in fact all can be proved fallacious.

The original French terminology of roulette has been replaced in English-speaking countries by equivalent English terms, and both will be used in this description.

ROULETTE CLOTH, or LAYOUT

Equipment for roulette consists of a table in which is mounted a compartmented wheel and one or two layouts, usually enameled on green cloth. Any number of persons may play, betting only against the bank (proprietor of the game). The *tourneur*, one of the croupiers in attendance, calls, "Make your bets, gentlemen" (*faites vos jeux, messieurs*), whereupon players indicate on the layout their bets on the number, or classification of number, they hope will win. The *tourneur* then spins the wheel in one direction and in contravention spins a small ivory ball which, when the wheel slows down sufficiently, falls into one of the numbered compartments and thus designates the winning number. When it appears to the *tourneur* that the ball will soon come to rest, he calls, "The betting is closed" (*rien ne va plus*). No bet may be placed thereafter.

When the ball rests, the *tourneur* announces the winning number and whether it is red or black, odd or even, low (1 to 18) or high (19 to 36). The bank pays winning bets at the established rates (see below) and collects losing bets, which a croupier gathers in with a rake.

For a winning bet on red (*rouge*), black (*noir*), high (*passé*), low (*manqué*), even (*pair*) or odd (*impair*), the bank pays "even money"—the amount of the bet. For a winning bet on the dozen (1 to 12, 13 to 24 or 25 to 36) in which the number falls, the bank pays 2 to 1; these bets are indicated on the layout as 12^p, 12^m and 12^d (respectively, *première*, *milieu* and *derrière douzaine*). Like-

ROULETTE WHEEL. NUMBERS ABOVE BLACK PANELS ARE BLACK; OTHER NUMBERS RED, EXCEPT ZERO, WHICH IS GREEN

wise, the bank pays 2 to 1 for a winning bet on the column in which the number lies.

Other bets, and the rate of payment when they win, are: (1) on a single number (*en plein*), 35 to 1; (2) on two numbers (*à cheval*), if either wins, 17 to 1. Such a bet is placed on the line between the two numbers. A bet may be made *à cheval* on two adjacent columns, or two adjacent dozens, and pays 4 to 1. (3) On three numbers (*transversale pleine*), if any wins, 11 to 1. A bet on 4, 5 or 6 would be indicated by placing a coin on the line

between 4 and *passé*, or between 6 and *manqué*. (4) On four numbers (*en carré*), if any wins, 8 to 1. A bet on the point of intersection between 14, 15, 17 and 18 would be a bet on those four numbers. (5) On six numbers (*transversale six*), if any wins, 5 to 1. A bet on the point of intersection between 15, 18 and *impair* would be a bet on 13, 14, 15, 16, 17 and 18.

The zero may be played *à cheval* with any adjoining number; or *en carré* (but called *quatre premiers*) with 1, 2 and 3; or in combination with 1 and 2, or with 2 and 3.

The advantage of the bank arises when the zero shows. Only bets on the zero *en plein* or in combination with 1, 2 and 3 are paid; all other bets are collected. Thus the bank should win one part in 37, or 2.7%, of all bets made against it.

At Monte Carlo, and in a few other casinos, this advantage is reduced by almost one-half in the case of the even-money bets. When the zero occurs, the player who placed such a bet may let the bank take half his bet (*partager*) or may have the bet put "in prison," to be decided on the next roll; whereon if the player wins he may withdraw his bet but is not paid in any case.

In distinction to this practice, many American gambling houses have roulette wheels with 38 compartments including both a zero and a double zero (00) and if either of them occurs all bets are taken except those involving the winning zero. The bank's advantage is thus increased to 5.26%. Finally, some wheels (seldom seen except in the smaller U.S. gambling houses and in Mexico) have 0, 00 and an eagle bird (equivalent to a third zero), giving the bank an advantage of 3 parts in 39, or 7.7%.

There is little possibility of the exercise of skill in roulette, though a certain judgment is advisable in betting; it would, for example, be unwise to place a bet on red and also on the number 17, which is black, for if one bet wins the other must lose.

Many books have been published on roulette, most of them being devoted to demonstration that no system of betting can be expected to win against the bank in the long run. (A. H. Mdn.)

ROUNDERS, an old English ball game played in Tudor times but not attaining any popularity before 1800. According to some, it was the immediate ancestor of baseball (*q.v.*), but there are several differences, the most radical being that the ball can be hit in any direction. Rounders in its primitive form was more of a romp than a regular game, but it experienced a big revival in Scotland and England in 1889 when two governing bodies were formed, the National Rounders association of Liverpool and vicinity and the Scottish Rounders association, and later with the Gloucester and Ling Physical Education association when rules similar to the modern ones were drawn up. The National Rounders association was formed in 1943.

A hard ball weighing 2½ oz. to 3 oz. and measuring 7½ in. in circumference is used; the rule by which a runner could be put out by hitting him with a thrown ball was abandoned. A round wooden stick is used measuring not more than 64 in. round the thickest part, not more than

18 in. in length and 100. more than 13 oz. in weight. The field is marked in an elongated diamond, the home base being at one end and first, second and third post at the other points, while fourth post is situated on the line of third post toward home and 28 ft. from the former, the sides of the diamond being 303 ft. The bowler stands in a square in the centre of the diamond and tosses the ball to the batsman who must take a good haul, *i.e.*, one that passes over the batting square and is below the head and above the knee; three consecutive bad bowls scores half a rounder for the batsman. The batsman must run to first and second post and so on to home base and scores one rounder if he does so after hitting the ball or half a rounder if he does so without hitting the ball and without having an opposing player touch the post to which he is running. He can be put out if the ball is caught on the fly; the post to which he is running is stumped or he is touched with the ball while it is in the possession of the fielder. If the ball is hit behind the home base, he can run only to first post until the ball has been thrown across the front line of the batting square or a continuation of it.

Nine players constitute a side and two innings apiece are played in each match. The back stop is placed directly behind the batsman; first, second, third and fourth basemen are stationed at the posts and there are three deep fielders. Two umpires preside over the game: (1) a batter's umpire who attends to balls that are too high or too low, first and fourth post catchers and to the bowler who must have both feet in the square during the bowling action and (2) a bowler's umpire who attends to balls that are too near or too wide and to second and third posts.

ROUNDHEAD, a term applied to the adherents of the parliamentary party in England during the great Civil War. Some of the Puritans, but by no means all, wore the hair closely cropped round the head, and there was thus an obvious contrast between them and the men of fashion with their long ringlets. "Round-head" appears to have been first used as a term of derision toward the end of 1641 when the debates in parliament on the Bishops Exclusion Bill were causing riots at Westminster. John Rushworth (*Historical Collections*) is more precise. According to him the word was first used on Dec. 27, 1641, by a disbanded officer named David Hyde, who during a riot is reported to have drawn his sword and said he would "cut the throats of those round-headed dogs that bawled against bishops." Baxter ascribes the origin of the term to a remark made by Queen Henrietta Maria at the trial of Strafford; referring to Pym, she asked who the round-headed man was. The name remained in use until after the revolution of 1688.

ROUNDSMAN SYSTEM (sometimes termed the billet, or ticket, or item system), in the English poor law, a plan by which the parish paid the occupiers of property to employ the applicants for relief at a rate of wages fixed by the parish. It depended not on the services, but on the wants of the applicants, the employer being repaid out of the poor rate all that he advanced in wages beyond a certain sum. According to this plan the parish in general made some agreement with a farmer to sell to him the labour of one or more paupers at a certain price, paying to the pauper out of the parish funds the difference between that price and the allowance which the scale, according to the price of bread and the number of his family, awarded to him.

It received the local name of billet or ticket system, from the ticket signed by the overseer which the pauper in general carried to the farmer as a warrant for his being employed, and afterwards took back to the overseer, signed by the farmer, as a proof that he had fulfilled the conditions of relief. In other cases the parish contracted with a person to have some work performed for him by the paupers at a given price, the parish paying the paupers.

In many places the roundsman system was carried out by means of an auction, all the unemployed men being put up to sale periodically, sometimes monthly or weekly, at prices varying according to the time of the year, the old and infirm selling for less than the able-bodied.

The roundsman system disappeared on the reform of the poor law in 1834.

ROUND TABLE, the celebrated board of King Arthur (*q.v.*) around which he and his knights sat. The origin of the myth is obscure, and certainly cannot be said to have been yet settled; it has been traced by various scholars to Welsh, Irish, or Breton sources.

The story was at first independent of the Arthurian saga. The

first known trace of it in an Arthurian connection is in the *Brut* of Wace (*q.v.*) in the reign of Henry II. Here the allusion is brief. Arthur made a round table at which, because of its shape, none of the "barons" could claim precedence over others. The size is left indefinite. Wace adds that the "Bretons" told many stories about the table; and this seems to indicate that there was a mass of Breton (or British) tradition about it known to Wace—a probability strengthened by the fact that elsewhere Wace shows signs of knowing many stories unknown to his main authority, Geoffrey of Monmouth (*q.v.*).

Half a century later, Layamon adds considerably to our information, and it would seem almost certain that he was drawing on Welsh tradition. There had been a great slaughter of the knights through disputes as to who should be greatest; and a Cornish carpenter, hearing of it, told Arthur he would make him a table at which more than 1,500 men could sit, so that there would be no more quarrels for the place of honour. Yet Arthur would be able to carry it about with him. It was finished in four weeks. "This," added Layamon, repeating Wace's words, "was the table about which the Britons told many tales." There is no reason to think that the poet was inventing; he makes over 30 additions to Wace, some of which are certainly not original; nor does he show anywhere a trace of inventive capacity.

Addition to the Legend.—Later romancers added many details. For example, the "Diot" *Perceval* (see *PERCEVAL*), tells us that just after Arthur's coronation Merlin related past history. A round table, said the seer, had been made for Joseph of Arimathea (*q.v.*) and a new one for Arthur's father, Uther Pendragon; let the king use it for his knights; without it the Romans could not be overcome. The table was also brought into connection with the Holy Grail (see *GRAIL*, *THE HOLY*) and with the "Siege Perilous" which is so prominent a feature in the Percival legend; and became ultimately an inseparable adjunct of the Arthurian cycle.

Whether the tale reached Wace and Layamon directly from Wales or from Brittany, it is certainly of ancient Celtic origin: a round table seems to have been a feature of primitive Celtic life; a circular form was the rule in primitive Irish architecture, and the primitive Celtic watch house, both in Gaul and in Ireland, was circular. To what this in its turn is to be traced is more doubtful: it is not unlikely that it arose from sun-worship, or possibly (*cf.* the "four weeks") from the moon. The magical character of the table seems, again, to be of a peculiarly Celtic cast; it resembles that of the enchanted bowls, bushels and horns so often found in Irish and Welsh saga; and it was inevitable that when the attractive force of the Arthurian legend was felt, such a magical table should be assigned to the king along with his enchanted sword, boat, lance and shield.

The Table at Winchester.—The famous round table fixed in the wall of the great hall at Winchester is certainly of considerable antiquity. It is a table-top 18 ft. in diameter, divided into 25 sectors, one for the king and one for each of the knights (whose number had long been reduced from the 1,500 of Layamon). The present colouring of the sections (green and white successively is due to Henry VIII. Hardyng, in his *Chronicle* (c. 1436), differing slightly from *Perceval*, says that it is the very table made by Joseph of Arimathea for the brethren of the Grail, which was transferred to Winchester by Uther to comfort Ygerne. He speaks in a manner that implies a great age for this table.

A good summary of the story is given by A. C. L. Brown in *Harvard Studies in Philology and Literature*, vol. vii., where other authorities are referred to. Incidental references will be found in the various works on different aspects of the Arthurian saga. (E. E. K.)

ROUNDWORM, the common name for the parasitic worms of the genus *Ascaris*, and especially for *A. lumbricoides*, which occurs in the intestine of man. Closely allied species inhabit the pig and the horse. The name roundworm is often extended to include all members of the class Nematoda (*q.v.*).

ROUS, FRANCIS (1579–1659), English Puritan, was born at Dittisham, in Devon in 1579, and educated at Oxford (Broadgates Hall, afterwards Pembroke College) and at Leyden. For some years he lived in seclusion in Cornwall and occupied himself with theological studies, producing among other books *The Arts of*

Happines (1619) and *Testis Veritatis*, a reply to Richard Montagu's *Appello Caesarem*. He entered parliament in 1625 as member for Truro, and continued to represent that or some neighbouring west country constituency in such parliaments as were summoned till his death. He obtained many offices under the Commonwealth, among them that of provost of Eton College. At first a Presbyterian, he afterwards joined the Independents. In 1657 he was made a lord of parliament. He died at Acton in January 1658-59. The subjective cast of his piety is reflected in his *Mystical Marriage . . . between a Soule and her Saviour* (1635), but he is best known by his metrical version of the Psalms (1643), which was approved by the Westminster Assembly and (in a revised form) is still used in the Scottish Presbyterian churches.

ROUSE, WILLIAM HENRY DENHAM (1863-1950), English educationist and classical scholar, was born at Calcutta, on May 30, 1863, and educated at the Grammar school, Haverfordwest, at Doveton college, Calcutta, and at Christ college, Cambridge, of which he was elected a fellow in 1888. After five years at Cheltenham college (1890-95) he obtained a travelling scholarship, and in the following year was appointed a master at Rugby. He remained until 1901, and was headmaster, 1902-28, of the Perse school, at Cambridge and also teacher of Sanskrit to Cambridge university, 1903-39. In 1912 he demonstrated the direct method of teaching Latin at the Columbia summer school. He died at North Hayling, Hants, on Feb. 10, 1950.

His publications include *Greek Votive Offerings* (1902); *Latin on the Direct Method* (1925); translations from the Pali and various editions of the classics.

ROUSSEAU, JEAN BAPTISTE (1671-1741), French poet, was born at Paris on April 6, 1671. His earlier comedies, *Le Café* (1694), *Le Flâneur* (1696), and *Le Copricieux*, and the opera *Venus et Adonis* (1697) were not successful. He was turned out of the Café Laurent, which was much frequented by literary men, on account of the libellous verse written by or attributed to him, but in 1701 he was made a member of the Académie des Inscriptions, and in 1710 he presented himself as a candidate for the Académie française. But in 1712 he was prosecuted for defamation of character and, on his non-appearance in court, was condemned to perpetual exile. He spent the rest of his life abroad, refusing to accept permission to return in 1716, because it was not accompanied by complete rehabilitation. He died at Brussels on March 17, 1741.

ROUSSEAU, JEAN JACQUES (1712-1778), French philosopher, was born at Geneva on June 28, 1712. His family had established themselves in that city at the time of the religious wars, but they were of pure French origin. Rousseau's father Isaac was a watchmaker; his mother, Suzanne Bernard, was the daughter of a minister; she died in childbirth, and Rousseau, who was the second son, was brought up in a haphazard fashion. When the boy was ten years old his father got entangled in a dispute with a fellow-citizen, and being condemned to a short term of imprisonment abandoned Geneva and took refuge at Lyons. Rousseau was taken charge of by his mother's relations and was committed to the tutorage of M. Lambercier, pastor at Bolsey. In 1724 he was taken into the house of his uncle Bernard, by whom he was shortly afterwards apprenticed to a notary. His master, however, found or thought him incapable and sent him back. After a short time (April 25, 1725) he was apprenticed afresh, this time to an engraver. He did not dislike the work, but was or thought himself cruelly treated, and in 1728 he ran away. Then began an extraordinary series of wanderings and adventures, for much of which there is no authority but his own *Confessions*. He first fell in with some proselytizers of the Roman faith at Confignon in Savoy, and by them he was sent to Madame de Warrens (or Vuarrens) at Annecy, a young and pretty widow who was herself a convert. Her influence, however, was not immediately exercised, and he was passed on to Turin, where there was an institution specially devoted to the reception of neophytes. His experiences here were unsatisfactory, but he abjured duty and was rewarded by being presented with 20 francs and sent about his business. He wandered about in Turin for some time, and at last established himself as footman to a Madame de

Vercellis. Here occurred the famous incident of the theft of a ribbon, of which he accused a girl fellow-servant. Madame de Vercellis died not long afterwards, but he found another place with the Comte de Gouvion. This he soon lost; he then resolved to return to Madame de Warrens at Annecy. The chronology of all these events, as narrated by himself, is somewhat obscure, but they seem to have occupied about three years.

Even then Rousseau did not settle at once in the anomalous position of domestic lover to this lady, who, nominally a converted Protestant, was in reality a kind of deist, with a theory of noble sentiment and a practice of libertinism tempered by good nature. She thought it necessary to complete his education, and he was sent to the seminarians of St. Lazare to be improved in classics, and also to a music master. In one of his incomprehensible freaks he set off for Lyons, and, after abandoning his companion in an epileptic fit, returned to Annecy to find Madame de Warrens gone. Then for some months he relapsed into the life of vagabondage, varied by improbable adventures, which (according to his own statement) he so often pursued. Hardly knowing anything of music, he attempted to give lessons and a concert at Lausanne; and he actually taught at Neuchâtel. Then he became, or says he became, secretary to a Greek archimandrite who was travelling in Switzerland to collect subscriptions for the rebuilding of the Holy Sepulchre; then he went to Paris, and, with recommendations from the French ambassador at Soleure, saw something of good society; then he returned on foot through Lyons to Savoy, hearing that Madame de Warrens was at Chambéry. This was in 1732, and Rousseau, who for a time had unimportant employments in the service of the Sardinian Crown, was shortly installed by Madame de Warrens, whom he still called Maman, as *amant en titre* in her singular household, wherein she diverted herself with him, with music and with chemistry. In 1736 Madame de Warrens, partly for Rousseau's health, took a country house, Les Charmettes, a short distance from Chambéry. Here in summer, and in the town during winter, Rousseau led a delightful life, which he has delightfully described. In a desultory way he did a good deal of reading, but in 1738 his health again became bad, and he was recommended to go to Montpellier. By his own account this journey to Montpellier was in reality a *voyage à Cythère* in company with a certain Madame de Larnage. This being so, he could hardly complain when on returning he found that his official position in Madame de Warren's household had been taken by a person named Vintzenried. In 1740 he became tutor at Lyons to the children of M. de Mably, not the well-known writer of that name, but his and Condillac's elder brother. But Rousseau did not like teaching and was a bad teacher, and after a visit to Les Charmettes, finding that his place there was finally occupied, he once more went to Paris in 1741. He was not without recommendations. But a new system of musical notation which he thought he had discovered was unfavourably received by the Académie des sciences, where it was read in Aug. 1742, and he was unable to obtain pupils, though the paper was published in 1743 under the title of *Dissertation sur la musique moderne*. Madame Dupin, however, to whose house he had obtained the entry, procured him the honourable if not very lucrative post of secretary to M. de Montaigu, ambassador at Venice. With him he stayed for about 18 months, and had as usual infinite complaints to make of his employer and some strange stories to tell. At length he threw up his situation and returned to Paris (1745).

His Literary Triumphs.—Up to this time—that is to say, till his 33rd year—Rousseau's life, though continuously described by himself, was of the kind called subterranean, and the account of it must be taken with considerable allowances. From this time, however, his general history can be checked and followed with reasonable confidence. On his return to Paris he renewed his relations with the Dupin family and with the literary group of Diderot, to which he had already been introduced by M. de Mably's letters. He had an opera, *Les Muses galantes*, privately represented; he copied music for money, and received from Madame Dupin and her son-in-law M. de Francueil a small but regular salary as secretary. He lived at the Hotel St. Quentin

for a time, and once more arranged for himself an equivocal domestic establishment. His mistress, whom towards the close of his life he married after a fashion, was Thérèse le Vasseur, a servant at the inn, whom he first met in 1743. She had little beauty, no education or understanding, and few charms that his friends could discover, besides which she had a detestable mother, who was the bane of Rousseau's life. But he made himself happy with her, and (according to Rousseau's account, the accuracy of which has been questioned [see F. Macdonald, *J. J. Rousseau*, 1906]) five children were born to them, who were all consigned to the foundling hospital. This disregard of responsibility was partly punished by the use his critics made of it when he became celebrated as a writer on education and a preacher of the domestic affections. Diderot, with whom from 1741 onwards he became more and more familiar, admitted him as a contributor to the *Encyclopédie*, for which he wrote the articles on music and political economy. He formed new musical projects, and he was introduced by degrees to many people of rank and influence, among them Madame d'Épinay, to whom in 1747 he was introduced by her lover M. de Francueil.

It was not, however, till 1749 that Rousseau made his mark as a writer. The academy of Dijon offered a prize for an essay on the effect of the progress of civilization on morals. Rousseau took up the subject, developed his famous paradox of the superiority of the savage state, won the prize, and, publishing his essay (*Discours sur les arts et sciences*) next year, became famous. The anecdote as to the origin of this famous essay is voluminous. It is agreed that the idea was suggested when Rousseau went to pay a visit to Diderot, who was in prison at Vincennes for his *Lettre sur les aveugles*. Rousseau says he thought of the paradox on his way down; Morellet and others say that he thought of treating the subject in the ordinary fashion and was laughed at by Diderot, who showed him the advantages of the less obvious treatment. Diderot himself, who in such matters is trustworthy, does not claim the suggestion, but uses words which imply that it was at least partly his. It is very like him. The essay, however, took the artificial and crotchety society of the day by storm. Francueil gave Rousseau a valuable post as cashier in the receiver-general's office. But he resigned it either from conscientiousness, or crotchety, or nervousness at responsibility, or indolence, or more probably from a mixture of all four. He went back to his music-copying, but the salons of the day were determined to have his society, and for a time they had it. In 1752 he brought out at Fontainebleau an operetta, the *Dévin du village*, which was successful. He received two louis for it, and he was ordered to come to court next day. This meant the certainty of a pension. But Rousseau's shyness or his perversity (as before, probably both) made him disobey the command. His comedy, *Narcisse*, written long before, was also acted, but unsuccessfully. In the same year, however, a letter *Sur la musique française*, in which he indulged in a violent tirade against French music, again had a great vogue. Finally, for this was an important year with him, the Dijon academy, which had founded his fame, announced the subject of "The Origin of Inequality," on which he wrote a discourse which was unsuccessful, but at least equal to the former in merit. During a visit to Geneva in 1754 he abjured his abjuration of Protestantism and was enabled to take up his freedom as citizen, to which his birth entitled him and of which he was proud. Shortly afterwards, returning to Paris, he accepted a cottage near Montmorency (the celebrated Hermitage) which Madame d'Épinay had fitted up for him, and established himself there in April 1756. Here he wrote *La Nouvelle Héloïse*; here he indulged in the passion which that novel partly represents, his love for Madame d'Houdetot, sister-in-law of Madame d'Épinay. Here too arose the obscure triangular quarrel between Diderot, Rousseau and Frederick Melchior Grimm, which ended Rousseau's sojourn at the Hermitage. The supposition least favourable to Rousseau is that it was due to one of his numerous fits of half-insane petulance and indignation at the obligations which he was nevertheless always ready to incur. That most favourable to him is that he was expected to lend himself in a more or less complaisant manner to assist and cover Madame

d'Épinay's passion for Grimm. At any rate, Rousseau quitted the Hermitage in the winter of 1757-58, and established himself at Montlouis in the neighbourhood.

Hitherto Rousseau's behaviour had frequently made him enemies, but his writings had for the most part made him friends. The quarrel with Madame d'Épinay, with Diderot, and through them with the *philosophie* party reversed this. In 1758 appeared his *Lettre à d'Alembert sur les spectacles*, written in the winter of the previous year at Montlouis. This was at once an attack on Voltaire, who was giving theatrical representations at Les Délices, on D'Alembert, who had condemned the prejudice against the stage in the *Encyclopédie*, and on one of the favourite amusements of the society of the day, and Rousseau was henceforward as obnoxious to the *philosophie* coterie as to the orthodox party. He still, however, had no lack of patrons—he never had—though his perversity made him quarrel with all in turn. The duke and duchess of Luxembourg made his acquaintance, and he was industrious in his literary work—indeed, most of his best books were produced during his stay in the neighbourhood of Montmorency. A letter to Voltaire on his poem about the Lisbon earthquake embittered the dislike between the two, being superstitiously published. *La Nouvelle Héloïse* appeared in the same year (1760), and it was immensely popular. In 1762 appeared the *Contrat social* at Amsterdam, and *Emile*, which was published both in the Low Countries and at Paris. For the latter the author received 6,000 livres, for the *Contrat* 1,000.

Julie, ou La Nouvelle Héloïse, is a novel written in letters describing the loves of a man of low position and a girl of rank, her subsequent marriage to a respectable freethinker of her own station, the mental agonies of her lover, and the partial appeasing of the distresses of the lovers by the influence of noble sentiment and the good offices of a philanthropic Englishman. It is too long, the sentiment is overstrained; but it is full of pathos and knowledge of the human heart. The *Contrat social*, as its title implies, endeavours to base all government on the consent, direct or implied, of the governed, and indulges in much ingenious argument to get rid of the practical inconveniences of the theory. *Emile*, the second title of which is *De l'éducation*, is much more of a treatise than of a novel.

Exile from France.—Rousseau's reputation was now higher than ever, but the term of the comparative prosperity which he had enjoyed for nearly ten years was at hand. The *Contrat social* was obviously anti-monarchic; the *Nouvelle Héloïse* was said to be immoral; the sentimental deism of the "Profession du vicair Savoyard" in *Emile* irritated equally the *philosophie* party and the church. On June 11, 1762, *Emile* was condemned by the parliament of Paris, and two days previously Madame de Luxembourg and the prince de Conti gave the author information that he would be arrested if he did not fly. They also furnished him with means of flight, and he made for Yverdon in the territory of Berne, whence he transferred himself to Motiers in Neuchâtel, which then belonged to Prussia. Frederick II. was not disposed to protect the persecuted when it cost him nothing and might bring him fame, and in Marshal Keith, the governor of Neuchâtel, Rousseau found a true and firm friend. He was, however, unable to be quiet or to practise any of those more or less pious frauds to be customary at the time with the unorthodox. The archbishop of Paris had published a pastoral against him, and Rousseau did not let the year pass without a *Lettre à M. de Beaumont*. The council of Geneva had joined in the condemnation of *Emile*, and in the *Lettres de la montagne* (1763), attacked the council and the Genevan constitution unsparingly. All this excited public opinion against him, and his unpopularity is said, on uncertain authority, to have culminated in a nocturnal attack on his house. At any rate he thought he was menaced if he was not, and migrated to the Ile St. Pierre in the Lake of Bièvre, where he once more for a short, and the last, time enjoyed that idyllic existence which he loved. But the Bernese Government ordered him to quit its territory.

David Hume offered him, late in 1765, an asylum in England, and he accepted. He passed through Paris, where his presence

was tolerated for a time, and landed in England on Jan. 13, 1766. Thérèse travelled separately, and was entrusted to the charge of James Boswell, who had already made Rousseau's acquaintance. Here he had once more a chance of settling peaceably. Severe English moralists like Johnson thought but ill of him, but the public generally was not unwilling to testify against French intolerance, and regarded his sentimentalism with favour. He was lionized in London to his heart's content and discontent, for it may truly be said of Rousseau that he was equally indignant at neglect and intolerant of attention. When, after not a few displays of his strange humour, he professed himself tired of the capital, Hume procured him a country abode in the house of Mr. Davenport at Wootton in Derbyshire. Here, though the place was bleak and lonely, he might have been happy enough, and he actually employed himself in writing the greater part of his *Confessions*. But his habit of self-tormenting and tormenting others never left him. His own caprices interposed some delay in the conferring of a pension which George III. was induced to grant him, and he took this as a crime of Hume's. The publication of a spiteful letter (really by Horace Walpole) in the name of the king of Prussia made Rousseau believe that plots of the most terrible kind were on foot against him. Finally he quarrelled with Hume because the latter would not acknowledge all his own friends and Rousseau's supposed enemies of the *philosophie* circle to be rascals. He remained, however, at Wootton during the year and through the winter. In May 1767 he fled to France, addressing letters to the lord chancellor and to General Conway, which show an unbalanced mind. He was received in France by the marquis de Mirabeau (father of the great Mirabeau), of whom he soon had enough, then by the prince de Conti at Trye. From this place he again fled and wandered about for some time in a wretched fashion, still writing the *Confessions*, constantly receiving generous help, and always quarrelling with, or at least suspecting, the helpers. In the summer of 1770 he returned to Paris, resumed music-copying, and was on the whole happier than he had been since he had to leave Montlouis.

Many of the best-known stories of Rousseau's life date from this last time, when he was tolerably accessible to visitors. He finished his *Confessions*, wrote his *Dialogues* (the interest of which is not quite equal to the promise of their curious sub-title, *Rousseau juge de Jean Jacques*), and began his *Réveries du promeneur solitaire*, intended as a sequel and complement to the *Confessions*, and one of the best of all his books. It should be said that besides these, which complete the list of his principal works, he has left a very large number of minor works, the fragments of another opera, *Daphnis et Chloé* (printed in 1780), and a considerable correspondence. During this time he lived in the Rue Platière, which is now named after him. But his suspicions of secret enemies grew stronger, and at the beginning of 1778 he was glad to accept the offer of M. de Girardin, a rich financier, and occupy a cottage at Ermenonville. The country was beautiful; but his old terrors revived, and his woes were complicated by the alleged inclination of Thérèse for one of M. de Girardin's stable-boys. On July 2 he died in a manner which has been much disputed, suspicions of suicide being circulated at the time by Grimm and others, though there is no reason to doubt the original verdict of apoplexy.

His Character and Influence.—There is little doubt that for the last 20 or 15 years of his life Rousseau was not wholly sane—the combined influence of late and unexpected literary fame and of constant solitude and discomfort acting upon his excitable temperament so as to overthrow the balance, never very stable, of his fine and acute but unrobust intellect. His moral character was undoubtedly weak, but it is fair to remember that but for his astounding *Confessions* the more disgusting parts of it would not have been known, and that these *Confessions* were written, if not under hallucination, at any rate in circumstances entitling the self-condemned criminal to the benefit of considerable doubt. If Rousseau had held his tongue, he might have stood lower as a man of letters; he would pretty certainly have stood higher as a man. He was, moreover, really sinned against, if still more sinning. Like other men of letters of his time he had to submit to some-

thing like persecution. The conduct of Grimm to him was certainly bad; and, though Walpole was not his personal friend, a worse action than his famous letter, considering the well-known idiosyncrasy of the subject, would be difficult to find. Only excuses can be made for him; but the excuses for a man born, as Hume after the quarrel said of him, "without a skin" are numerous and strong.

His peculiar reputation increased after his death, when the paradox of Rousseauism, the belief in the superiority of "the noble savage" to civilized man, became more and more fashionable. The men of the Revolution regarded him with something like idolatry, and his literary merits conciliated many who were far from idolizing him as a revolutionist. His style was taken up by Bernardin de Saint Pierre and by Chateaubriand. Byron's fervid panegyric enlisted on his side all who admired Byron—that is to say, the majority of the younger men and women of Europe between 1820 and 1850—and thus different sides of his tradition were continued for a full century after the publication of his chief books. His religious unorthodoxy was condoned because he never scoffed; his political heresies, after their first effect was over, seemed harmless from the very want of logic and practical spirit in them, while part at least of his literary secret was the common property of almost every one who attempted literature.

In religion Rousseau was undoubtedly what he has been called above—a sentimental deist; but sentimentalism was the essence, deism the accident of his creed. In his time orthodoxy at once generous and intelligent hardly existed in France. There were ignorant persons who were sincerely orthodox; there were intelligent persons who pretended to be so. But between the time of Massillon and D'Aguesseau and the time of Lamennais and Joseph de Maistre the class of men of whom in England Berkeley, Butler and Johnson were representatives did not exist in France. Little inclined by nature to any but the emotional side of religion, and utterly undisciplined in any other by education, course of life, or the general tendency of public opinion, Rousseau took refuge in the nebulous kind of natural religion which was at once fashionable and convenient.

In politics Rousseau was a sincere and, as far as in him lay, a convinced republican. He had no great tincture of learning, he was by no means a profound logician, and he was impulsive and emotional in the extreme—characteristics which in political matters predispose the subject to the preference of equality above all political requisites. He saw that under the French monarchy the actual result was the greatest misery of the greatest number, and he did not look much further. The *Contrat social* is for the political student one of the most curious and interesting books existing. Historically it is null; logically it is full of gaping flaws, practically its manipulations of the *volonté de tous* and the *volonté générale* are clearly insufficient to obviate anarchy. But its mixture of real eloquence and apparent agency is exactly what always carries a multitude with it, if only for a time. Moreover, in some minor branches of politics and economics Rousseau was a real reformer. Visionary as his educational schemes (chiefly promulgated in *Émile*) are in parts, they are admirable in others, and his protest against mothers refusing to nurse their children hit a blot in French life which is not removed yet, and has always been a source of weakness to the nation.

But it is as a literary man pure and simple—that is to say, as an exponent rather than as an originator of ideas—that Rousseau is most noteworthy, and that he has exercised most influence. The first thing noticeable about him is that he defies all customary and mechanical classification. He is not a dramatist—his work as such is insignificant—nor a novelist, for, though his two chief works except the *Confessions* are called novels, *Émile* is one only in name, and *La Nouvelle Héloïse* is as a story diffuse, prosy and awkward to a degree. He was without command of poetic form, and he could only be called a philosopher in an age when the term was used with such meaningless laxity as was customary in the 18th century. If he must be classed, he was before all things a describer—a describer of the passions of the human heart and of the beauties of nature. In the first part of his vocation the novelists of his own youth, such as Marivaux, Richardson and Prévost,

may be said to have shown him the way; in the second he was almost a creator. In combining the two and expressing the effect of nature on the feelings and of the feelings on the aspect of nature he was absolutely without a forerunner or a model. And, as literature since his time has been chiefly differentiated from literature before it by the colour and tone resulting from this combination, Rousseau may be said to hold, as an influence, a place almost unrivalled in literary history. The defects of all sentimental writing are noticeable in him, but they are palliated by his wonderful feeling, and by the passionate sincerity even of his insincere passages.

BIBLIOGRAPHY.—The first complete edition of Rousseau's works appeared at Geneva in 1782-83 in 47 small volumes. There have been many since, the most important of them being that of Musset-Pathey (1824). Some unpublished works, chiefly letters, were edited by Boscha (1858) and Strecker and Moulton (1861). See also the latter's *Rousseau et ses amis* (1865), and the edition of Rousseau's *Correspondance Générale* by Dufour and Plan (1924 et seq.). The chief bibliographies are: in French that of Saint Marc Girardin (1874), in English the *Life* by Viscount Morley (1873; new ed. 1915). But the materials for his biography are so controversial and so personal that the correct historical view can hardly be said yet to be standardized. Mrs. Frederick Macdonald, in her *Jean Jacques Rousseau* (1906), makes out a good case for regarding Mme. d'Épagny's *Mémoires* as coloured, if not actually dictated, by the malevolent attitude of Grimm and Diderot; and her study of the documents undoubtedly qualifies a good many of the assumptions that had previously been made. See also E. Ritter, *Famille et jeunesse de Rousseau* (1896); A. Housaye, *Les Charmettes* (2nd ed., 1864); L. Ducros, *J. J. Rousseau de Genève à l'émigration, 1712-57* (1908). The *Annales de la Société J. J. Rousseau* began to appear in 1905; Albert Schind, *La Pensée de J. J. Rousseau* (1920).

ROUSSEAU, PIERRE ÉTIENNE THÉODORE (1812-1867), French painter of the Barbizon school, was born in Paris on April 15, 1812, the son of a tailor. At the age of 15 he began his artistic education under the landscapist Charles Rémond and then under Guillon-Lethière. But his style was formed chiefly by his own efforts in working direct from nature in various parts of France. Théodore Rousseau shared the difficulties of the romantic painters of 1830 in securing for their pictures a place in the annual Paris exhibition. The influence of the classically trained artists was against them. He exhibited one or two unimportant works in the Salon of 1831 and 1834, but in 1836 his great work "La Descente des vaches" was rejected; and from then until 1848 he was persistently refused. He was not without champions in the press, and under the title of "le grand refusé" he became known through the writings of Thoré, the critic who afterwards resided in England and wrote under the name of Bürger. During these years of artistic exile Rousseau produced some of his finest pictures: "The Chestnut Avenue," "The Marsh in the Landes" (Louvre), "Hoar-Frost" (now in America); and in 1851, after the reorganization of the Salon in 1848, he exhibited his masterpiece, "The Edge of the Forest" (Louvre), a picture similar in treatment to the composition called "A Glade in the Forest of Fontainebleau," in the Wallace collection.

Up to this period Rousseau had lived only occasionally at Barbizon, but in 1848 he took up his residence in the forest village. At the Exposition Universelle of 1855, where all Rousseau's rejected pictures of the previous 20 years were gathered together, his works were acknowledged to form one of the finest groups. However, his struggles continued and his health began to give way. He was elected president of the fine art jury for the 1867 Exposition. Finally he began to sink, and he died, in the presence of his friend, J. F. Millet, on Dec. 22, 1867.

Rousseau's pictures are always grave in character, with an air of exquisite melancholy. He left a number of sketches and water-colour drawings. His pen work is rare; it is particularly searching in quality, he also executed four engravings and two hellogravures. There are a number of fine pictures by him in the Louvre, and the Wallace collection contains one of his most important Barbizon pictures. There is also an example in the Ionides collection at the Victoria and Albert museum.

See A. Sennier, *Œuvres de Th. Rousseau* (1872); E. Michel, *Les Artistes célèbres: Th. Rousseau* (1891); J. W. Mollet, *Rousseau and Dias* (1890); D. Croal Thomson, *The Barbizon School of Painters: Th. Rousseau* (1892); E. Chesneau, *Peintres romantiques: Th. Rousseau* (1880); P. Burty, *Maîtres et petit-maîtres: Th. Rousseau*

(1877); W. Gensel, *Millet and Rousseau* (Bielefeld, 1902); L. Deltail, *Le Peintre-Graveur* (1908); E. Michel, *La Forêt de Fontainebleau* (1909).

ROUSSEAU DE LA ROTTIÈRE, JEAN SIMÉON (b. 1747), French decorative painter, was the youngest son of Jules Antoine Rousseau, "sculpteur du Roi." He studied at the Académie Royale in 1768 winning the medal given to the best painter of the quarter. He appears, with his brother Jules Hugues, to have been employed by his father for the decorative work executed by the family at Versailles. Many of the attributions are fairly determined by dates, Jules Antoine Rousseau having been at work at Versailles for years before the birth of his famous son. There can be little doubt that the "Bains du Roi," the "Salon de la Méridienne," part of the bedchamber of Madame Adélaïde, and the "Gardiens-robe de Louis XVII" were shared in by Rousseau de la Rottière. His most individual and most famous undertaking was, however, the decoration of the lovely "Boudoir de Madame de Sévigné," purchased for the Victoria and Albert museum in 1869. There is no information as to Rousseau's later life. The last known mention of him is in 1792.

ROUSSEL, ALBERT (1869-1937), French composer, was born at Tourcoing on April 5, 1869. He left the navy in 1894 to study music in Paris, and in 1902 became professor at the Schola Cantorum. The delightful *Risquies* (1904-06), the first symphony *Le Poème de la Forêt* (1904-06) and the charming ballet *Le Festin de l'Araignée* (1912) were all manifestly the work of a gifted composer. The *Diversissement* (piano and wind instruments, 1906), *Évocations*, three symphonic poems, one with chorus (1910-11), the orchestral prelude *Pour une Fête de Printemps* (1920), the second symphony (op. 23, 1919-20) and the opera-ballet *Padmavati* (1923) are among his other works.

ROUSSILLON, a former province of France, corresponding geographically to the fertile plain bounded by the eastern Pyrenees, the Corbières and the Mediterranean and to the modern department of Pyrénées-Orientales (q.v.). It derives its name from a Roman town, Ruscin, near Perpignan, the later capital. It formed part of the Roman province of Narbonensis and, in the 5th century, of the Visigothic kingdom that extended over Spain and Aquitaine. Even after the defeat of Alaric II at Vouillé (507) and the loss of Aquitaine, Roussillon long remained a Visigothic lands, as did the rest of Septimania (from the lower Rhone to the Pyrenees). Only after being overrun by the Arabs, from 719 to 759, was it occupied by the Franks. Under Charlemagne it was incorporated in the Marca Hispanica, but in 865 Charles the Bald detached the districts around Narbonne. Henceforth Roussillon was closely linked with Catalonia and looked mostly southward to Barcelona. In 873 Joffre the Hairy, count of Barcelona, killed the Frankish count, occupied the country and gave it to his brother Miron, who was the head of a line of hereditary counts that lasted until 1172, when Gerard II left his inheritance to the count of Barcelona, King Alphonso II of Aragon. Yet it remained legally part of the French kingdom till 1258, when, by the treaty of Corbeil, Louis IX surrendered it with the countship of Barcelona to James I of Aragon. Under Aragonese rule the province was prosperous; Collioure, the port of Perpignan, became a centre of Mediterranean trade. From 1276 to 1344 Roussillon was part of the ephemeral kingdom of Majorca created by James I in favour of his younger son, James, and the new state had Perpignan as its capital. But in the 15th century the French king became interested in Roussillon, and in 1462, by the treaty of Bayonne, Louis XI promised to help John II of Aragon against the rebellious Catalans and was to occupy the castles of Perpignan and Collioure as a security for the reimbursement of his expenses. In fact he had the whole of Roussillon and Cerdagne occupied and annexed to France in 1463. French rule was most unpopular, and Roussillon revolted in 1474, but after two sieges (1473 and 1475) Perpignan was retaken by the French and the country subdued. Still, in 1493, by the treaty of Barcelona, Charles VIII gave it back to Ferdinand of Aragon to win his good will for the Italian campaign. However, in 1639 and in 1647 (when Catalonia revolted against Spain) the French invaded Roussillon; Perpignan was taken after a long siege (Jan.-Sept. 1642), and the treaty of the Pyrenees (1659) secured Roussillon and half of Cerdagne to the French crown. During the revolutionary wars, Roussillon was for a short time invaded by a Spanish army (1793-94). The 19th century was marked by the steady growth of left-wing opinion and by a complete transformation of agriculture which made the country a rich producer of early vegetables and fruits, as well as of wines.

ROUTH, EDWARD JOHN (1831-1907), English mathematician, was born at Quebec, Canada, on Jan. 20, 1831. At the age of 11 he went to England, and after studying under A. de Morgan at University College, London, entered Peterhouse, Cambridge, in 1851. In the mathematical tripos three years later he was senior wrangler. J. Clerk Maxwell, who tied with him for the Smith's prize, being second. Elected a fellow of his college, he devoted himself to teaching. Routh also found time to make contributions to mathematics, and to write his classic works on dynamics and statics.

He was elected F.R.A.S. in 1866 and F.R.S. in 1872. He died at Cambridge on June 7, 1907.

See *Roy. Soc. Proc.*, vol. lxxiv; *London Math. Soc. Proc.*, vol. v; *Monthly Notices of Roy. Astron. Soc.*, vol. lxviii; *Nature*, vol. xxviii.

ROUTLEDGE, GEORGE (1812-1888), English publisher, was born at Brampton in Cumberland on Sept. 23, 1812. He started in business for himself as a bookseller in London in 1836, and as a publisher in 1843. He was a pioneer of cheap classics; the shilling volumes called the "Railway Library" were a success, including as they did *Uncle Tom's Cabin*. He also published in popular form writings of Washington Irving, James Fenimore Cooper, Edward Bulwer-Lytton and Benjamin Disraeli. A branch of Routledge's publishing business was established in New York in 1854. Routledge died in London on Dec. 13, 1888.

ROUVIER, MAURICE (1849-1911), French statesman, was born at Aix on April 17, 1842. He supported Léon Gambetta's candidature at Marseilles in 1867, and in 1870 he founded an anti-imperial journal, *L'Égalité*. In July 1871 he was returned to the national assembly for Marseilles at a by-election. He became a recognized authority on finance, and repeatedly served on the budget commission as reporter or president. In 1881 he joined Gambetta's cabinet as minister of commerce and the colonies, and in the 1883-85 cabinet of Jules Ferry he held the same office. He became premier and minister of finance on May 31, 1887, with the support of the moderate republican groups, the Radicals holding aloof in support of Gen. Georges Boulanger, who began a violent agitation against the government. Then came the scandal of the decorations in which Pres. François Grévy's son-in-law Daniel Wilson figured, and the Rouvier cabinet fell. Rouvier was minister of finance in a succession of ministries between 1889 and 1893. He was driven out of office by the Panama scandals; in 1902, after nearly ten years of exclusion from office, he joined the Radical cabinet of M. Combes; and on the fall of the Combes ministry in Jan. 1905 he became premier, with Theophile Delcassé at the head of the foreign office. Delcassé, reproached with imprudence in the Morocco affair (see *EUROPE: History*), resigned, and the prime minister took over foreign affairs and came to an agreement with the German government. His ministry fell in 1906 over questions connected with the Separation law. Rouvier died at Neuilly on June 7, 1911.

ROUX, PIERRE PAUL EMILE (1853-1933), French bacteriologist, was born at Confolens, Charente, on Dec. 17, 1853. He studied medicine, and obtained an appointment to the Faculty of Medicine in Paris, which he held from 1874 to 1878. He then worked for ten years in Louis Pasteur's laboratory, before being appointed to a post in the Pasteur institute. He was director of the institute from 1904 to 1918. Roux did a great deal of research in collaboration with Pasteur, and studied the treatment of infectious diseases, including hydrophobia. He studied anthrax in conjunction with Pasteur and Charles Edouard Chamberland, and produced vaccines against this disease. He was associated with the Swiss bacteriologist, Alexandre Yersin, in the study of the diphtheria bacillus and its toxins. With Emil von Behring he introduced the use of an antitoxin in diphtheria. He made a famous communication on this subject to the International Congress of Medicine at Budapest, Hung., in 1894. He claimed antitoxin as of value prophylactically and as a remedy. *Figaro* opened a public subscription and in a few weeks more than 1,000,000 fr. rolled in. The money was devoted to the preparation and distribution of diphtheria antitoxin by the Pasteur institute.

See *Lancet*, vol. 225, p. 1124 (1933).

ROUYN, a mining city in northwest Quebec, Can., on Lake

Osisko, on the Canadian National and Nipissing Central railways, 340 mi. N.W. of Montreal and 320 mi. N. of Toronto. Pop. (1951) 14,502; with its twin city of Noranda (immediately adjoining but under separate administration) the 1951 population totalled 24,104, compared with 13,346 in 1941. The rapid expansion from raw bush in 1925 to modern urban development was a result of the discovery of minerals and the completion in 1927 of a branch of the Canadian National railway. Rouyn lies east, and is on the continuation of the mineral-bearing rocks of the Porcupine gold district and the Cobalt silver district of Ontario. Its chief industry is copper-gold production, and the Noranda mine (with capital expenditure of more than \$12,000,000 by mid-century on smelter and concentrator equipment) is the most important in the Rouyn area. It ships copper anodes to Montreal for refining.

(C. Cy.)

ROVERETO, a town of the province of Trento, Italy, 15 mi. by rail southwest of the town of that name. Pop. (1936) 11,155 (town); 20,758 (commune). Built on the left bank of the Adige, in the widest portion of the valley, it is divided into two parts by the Leno torrent. Save in the newer quarter of the town, the streets are narrow and crooked, one being named after the most distinguished native of the place, Antonio Rosmini-Serbaty (q.v.). The finest church is that of Santa Maria del Carmine, the old 14th-century church now serving as a sacristy to that built from 1678 to 1750. The church of San Marco dates from the 15th century, and so do the municipal palace and the savings bank. The town is dominated by the castle (containing a war museum), which was reconstructed in 1492 by the Venetians, after it had been burned in 1487 by the count of Tirol. It was very much damaged in World War I, but its industries (silk, cotton, gloves, paper, metals, etc.) later revived.

In 1132 the emperor Lothair found the passage of the gorge above the site of the town barred by a castle, which he took and gave to one of his Teutonic followers, the ancestor of the Castelbarco family. The first record of the town dates from 1154. In 1411 it was taken by the Venetians. In 1509 the town gave itself voluntarily to the emperor Maximilian, to whom it was ceded formally by Venice in 1517, and next year incorporated with Tirol.

ROVIGNO, a seaport of Italy, in Istria, 23 mi. N.N.W. of Pola by rail. Pop. (1936) 9,035 (town), 10,028 (commune). It is on the west coast of Istria, and possesses a cathedral, built on the summit of Monte di Sant' Eufemia. Its campanile, built after the model of the famous campanile in Venice, is crowned with a bronze statue of St. Eufemia, the patron saint of the town, whose remains are preserved in the church. In the neighbourhood are vineyards and olive gardens. Rovigno is the principal centre of the local sardine fishery and cannery. Rovigno is the ancient Arupenum or Rubinum. It became Venetian in 1283.

ROVIGO, town of Venetia, Italy, capital of the province of Rovigo. It stands between the lower Adige and the lower Po, 50 mi. S.W. of Venice by rail and 27 mi. S.S.W. of Padua, and on the Adigetto canal, 17 ft. above sea level. Pop. (1936) 14,561 (town), 39,954 (commune). It is a station on the line between Bologna and Padua, with branches to Legnago and Chioggia. The architecture of the town bears the stamp both of Venetian and of Ferrarese influence. The finest church is the Madonna del Soccorso, an octagon with a lofty campanile, begun in 1594 by Francesco Zamberlan of Bassano, a pupil of Andrea Palladio. The town hall contains a library including some rare early editions and a fair picture gallery. The Palazzo Roncale is a fine Renaissance building by Sammicelli (1553). Two towers of the mediaeval castle remain (920). Rovigo (Neo-Latin *Rhodigium*) is mentioned as Rodigo in 838.

ROVUMA, a river, about 500 mi. long, forming the boundary between Tanganyika territory and Portuguese East Africa. The lower Rovuma is formed by the junction of two branches of nearly equal importance, the longer, the Lujenda, coming from the southwest; the other, the Rovuma, from the west. Its source lies on a plateau of Archaean rocks 3,000 ft. high, east of Lake Nyasa. In its eastward course the Rovuma flows near the base of the escarpment of an arid plateau to the north, from

which direction the streams, which have cut themselves deep channels in the plateau edge, have almost all short courses. On the opposite bank the Rovuma receives, besides the Lujenda, the Msenga and Luchulingo, flowing in broad valleys running from south to north. The Lujenda rises near Lake Chlwa, in the small Lake Chlwa (1,700 ft.), the swamps to the south of this being separated from Chlwa only by a narrow wooded ridge. The river, at its mouth about 1 mi. wide, is fordable in many places in the dry season.

ROWE, NICHOLAS (1674–1718), English dramatist and miscellaneous writer, son of John Rowe (d. 1692), barrister and serjeant-at-law, was baptized at Little Barford in Bedfordshire on June 30, 1674. Nicholas Rowe was educated at Westminster school under Dr. Busby. He became in 1688 a King's scholar, and entered the Middle Temple in 1691. On his father's death he became the master of an independent fortune. His first play, *The Ambitious Step-mother*, the scene of which is laid in Persopolis, was produced in 1700, and was followed in 1702 by *Tamerlane*. In this play the conqueror represented William III, and Louis XIV is denounced as Bajazet. It was for many years regularly acted on the anniversary of William's landing at Torbay. In *The Fair Penitent* (1703), an adaptation of Massinger and Field's *Fatal Dowry*, occurs the character of Lothario, whose name passed into current use as the equivalent of a rake. Calista is said to have suggested to Samuel Richardson the character of Clarissa Harlowe, as Lothario suggested Lovelace. Other plays are: *The Biter* (1704), *Ulysses* (1706), *The Royal Convert* (1707), *The Tragedy of Jane Shore* (1714) and *The Tragedy of Lady Jane Grey* (1715).

In 1715 Rowe succeeded Nahum Tate as poet laureate. He died on Dec. 6, 1718, and was buried in Westminster abbey.

Rowe was the first modern editor of Shakespeare. It is unfortunate that he based his text (6 vols., 1709) on the corrupt Fourth Folio, a course in which he was followed by later editors. We owe to him the preservation of a number of Shakespearean traditions, collected for him at Stratford by Thomas Betterton. These materials he used with considerable judgment in the memoir prefixed to the *Works*. He divided the play into acts and scenes on a reasonable method, noted the entrances and exits of the players, and prefixed a list of the *dramatis personae* to each play.

Rowe's *Works* were printed in 1727, and in 1736, 1747, 1756, 1766 and 1791; his occasional poems are included in Anderson's and other collections of the British poets.

ROWELL, NEWTON WESLEY (1867–1941), Canadian jurist, was born on Nov. 1, 1867, in Middlesex county, Ontario. He was called to the bar in 1897, and became head of a law firm in Toronto. He was elected to the Ontario legislative assembly for North Oxford in 1911, and from that year to 1917 was leader of the liberal opposition in the Ontario legislature. In Oct. 1917 he entered the federal government as president of the council and vice-chairman of the war committee of the cabinet, and was a member of the dominion lower house 1917–21. He was a member of the Imperial war cabinet and Imperial War conference, 1918; Canadian representative at the International Labour conference at Washington, 1919; and a Canadian delegate to the first assembly of the League of Nations at Geneva, 1920, subsequently becoming vice-president of the League of Nations society in Canada. He wrote *The British Empire and World Peace* (1922), and *Canada, a Nation* (1923). He became a K.C. in 1902, and was chief justice of Ontario, 1936–38. He died Nov. 22, 1941.

ROWING, the propulsion of a boat by means of oars in a succession of strokes. An oar is a shaft of wood with a rounded handle at one end and a blade at the other. The blade, a thin broadened surface is either flat or slightly curved to offer increased resistance to the water (spoon-oar). The loom or middle portion rests in a notch or row-lock or between thole-pins on the gunwale or outrigger of the boat.

Racing oars are provided with leather buttons to prevent the oar from slipping outward. An oar may be regarded as a lever of the first order, the weight to be moved being the water and the fulcrum being at the lock or thole-pin; or as a lever of the second order, the weight to be moved being the boat, and the ful-

crum the water pressing against the blade. Theoretically an oar functions at one and the same time in both capacities (see G. C. Bourne, *A Text-Book of Oarsmanship*, chapter 11, Oxford, 1925), but practically the lock or pin is the fulcrum, and the point at which the oar is buttoned determines the leverage and is a fundamental factor in the mechanics of rowing.

Rowing a boat and paddling a canoe (*q.v.*) have in common the propulsion of a floating craft through the water by muscular power applied to a lever, oar or paddle, in a succession of strokes. But in rowing, the oarsman, seated on a thwart, faces toward the stern and pulls the oar handle toward his body with the tholepin or oarlock as a fixed fulcrum, while in paddling a canoe the canoeist, generally in a kneeling position, faces toward the bow and throws forward the weight of his body, using one arm as a moving fulcrum. In nautical use sculling is the propulsion of the boat by a single long oar worked to and fro from a notch in the stern transom, the blade being turned under water so as to give both projection and direction and acting like the tail of a fish. "Sweeps" and "sculls" are traditional terms for long and short oars.

As rowing developed into a form of competitive sport new terms were introduced and traditional terms acquired special meanings. Technically a stroke includes all the motions of an oarsman from the time he dips his oar for the catch to the time when it is again in the same position. The recovery is the part of the stroke during which the blade is in the air. Feathering is turning the blade by a wrist motion as it is lifted from the water and carrying it toward the bow in a nearly horizontal position until it is squared or bevelled (*i.e.*, the upper edge inclined slightly to the stern) for the next stroke. If the oarsman fails to clear the water with his blade on the recovery, because he has feathered too soon or too much or too little or because the boat has lurched down on his side, he "catches a crab."

Sculling as distinguished from its nautical sense is propelling a light racing craft with an oar in each hand. Oars so used are called sculls. "Singles" and "doubles" are popular entries in all regattas, and champion scullers have won wide acclaim. Rowing in the specialized sense is the art of propelling a racing craft by two or more oarsmen, each of whom handles a single oar, called a sweep. Paddling in boat racing parlance is rowing at reduced speed and at a leisurely pace. Sweep oarsmen row in pairs, fours, sixes (obsolete) and eights, the latter achieving the greatest speed and requiring the most complete co-ordination of skill. Eights are numbered from the bow, and number eight is known as stroke.

The coxswain (cock, a small boat; swain as in boatwain) not only steers but gives the necessary commands and in a race calls for spurts and in a stern chase informs the captain or the stroke of the position of the competing boats. The coxswain is the quarterback of the rowing team and with the stroke should plan and determine the strategy and rowing of each race.

A well-trained and finished eight-oared crew and a single sculler represent the highest developments of the art of rowing, and to produce a winning eight is the ambition of every club or school or college that fosters rowing as a form of competitive sport.

HISTORY—Rowing is now confined almost entirely to small boats and racing shells, but in ancient times it was the chief means of propelling vessels of war. As the size of vessels increased, sails gradually displaced oars, in both warships and merchant ships, but large galleys (*q.v.*) continued to be rowed in the Mediterranean until the 18th century. The oarsmen, generally captives of war or criminals, were chained to the benches, whence the term "galley slaves." Ancient galleys were rated according to the number of rowing banks or tiers of oars. The first recorded Roman fleet consisted of triremes. The earliest amateur oarsmen of whom there is record were the islanders who hospitably entertained Ulysses on his return to Ithaca. Their epithet in the *Odyssey* is "the oar-loving Phaeacians" (*Φαίηκες ὀλῆπτεροι*). Boat races probably formed part of the Panathenaic and Isthmian festivals (see *BOAT*).

Virgil, in his account of the funeral games instituted by Aeneas for his father Anchises, gives a vivid description of a boat race (*Aeneid*, v, 114–285):

The waiting crews are crowned with poplar wreaths;
 Their naked shoulders glisten, moist with oil.
 Ranged in a row, their arms stretched to the oars,
 All tense the starting signal they await.
 Together at the trumpet's thrilling blast
 Their bent arms churn the water into foam;
 The sea gapes open by the oars up-torn;
 With shouts and cheers of eager partisans
 The woodlands ring, the sheltered beach rolls up
 The sound, the hills re-echo with the din.

The earliest invasions of England were effected with the help of oars. The Britons, paddling wicker coracles, were no match for the legions that Caesar landed on their headlands from his Roman triremes. Later the Anglo-Saxons, rowing and sailing across the North sea, and after them the Danes, entered the estuaries of the east coast. Sails are mentioned often than oars in Old English literature, and rowing had not yet become a sport that could be described in Shakespeare's words:

There be some sports are painful, and their labour
 Delight in them sets off.

William of Malmesbury (c. 1080-c. 1143) records that Edgar the Peaceful was rowed in state on the river Dee by tributary kings, himself acting as coxswain.

Boat Racing in England.—The Thames may fairly be called the cradle of rowing as a pastime and competitive sport in modern times. The nobility and gentry who had mansions on the banks of the river relied almost entirely on their elaborately fitted barges as a means of conveyance. As early as 1454 Sir John Norman, mayor of London, "built a noble barge, and was rowed by watermen with silver oars." The lord mayor's procession by water to Westminster was an annual event until 1856. From the 15th century on, a considerable body of men lived by "the trade of rowing" as the statutes define the occupation of the watermen. In Queen Anne's time the river was still the highway of London, and there were about 10,000 licensed watermen on the tidal reaches of the Thames above London bridge. There were undoubtedly competitions between these in the 16th and 17th centuries, but the first race of which there is record is that for the "Doggett's Coat and Badge." Thomas Doggett, an Irish comedian, in 1715 offered an "orange livery with a badge representing Liberty to be rowed for by six watermen from London Bridge to Chelsea, annually on the same day, August 1, forever." Except during World Wars I and II, the race was rowed regularly under the administration of the Fishmongers' company.

The first English regatta (Italian *regata*, originally a gondola race in Venice) took place on the Thames in 1775. Though there are numerous instances of professional matches at the beginning of the 19th century, the increased participation in boat racing by amateur oarsmen, after the Napoleonic wars, overshadowed professional rowing, which never had the vogue in England which it attained in the United States (see below). Eton had a ten-oared boat, the "Monarch," and three eight-oars as early as 1811, but there is no record of any formal racing between amateur crews until 1817, the date of the founding of the Leander club, which rapidly gained the prestige it maintained from that time, as the oldest and most distinguished rowing club, whose oights, composed mainly of Oxford and Cambridge varsity oarsmen, upheld the highest standards of English rowing and sportsmanship.

The first race between Oxford and Cambridge was rowed in 1829 over a 2-mi. course at Henley, but it was not renewed until 1836. In 1845 the race was rowed over a 4½-mi. course from Putney to Mortlake, and in 1856 became an annual event except during World Wars I and II, attracting huge crowds along the banks of the river.

The Henley Royal Regatta.—The reaches of the Thames at Henley are not only the most beautiful along the river, but, because of a straight stretch of more than a mile immediately below the town, offer an ideal course for racing shells.

The Henley Royal regatta, established in 1839, has brought together not only the pick of English crews but, in the open events, has attracted competitors from Europe, America and Australia. Like other comparable events, it was interrupted by World Wars I and II. The course is 1 mi. 550 yd. with its finish near the town bridge in sheltered water, with sunny meadows and the shaded

lawns of country houses on each side of the river. The races are rowed in the first week of July and furnish three days of continuous excitement to the spectators that throng the towpath and the enclosures at the finish. Owing to the narrowness of the river and the many entries, the races are now rowed in heats of two or more entries. The course is protected by booms on each side, behind which spectators in punts and on houseboats moored along the banks obtain an unobstructed and close view of the competing oarsmen. There have for many years been eight events, four of which are open to all amateurs; viz, the Grand Challenge cup for eight oars (the oldest, established in 1839), the Stewards' cup for fours, the Silver Goblets for pair-oars and the Diamond Sculls for single scullers. In 1939 a ninth event, the Double Sculls, was added. The Grand Challenge cup and the Diamond Sculls have long been the most coveted trophies in the rowing world.

Australia and Canada.—Rowing as a sport began in Tasmania about 1830, and by 1880 eight-oared races between crews representing the various states had become annual fixtures, held alternately in the six capital cities. Interuniversity rowing originated in 1870. In 1893 Old Blues from Oxford and Cambridge presented the magnificent Oxford and Cambridge cup, which thereafter was contested for by the six state universities and like the interstate contest is rowed in each capital city by rotation.

In Canada, the 1870s were the heyday of the professional scullers. Purses ran from \$50 upward to \$1,000 and in international matches from £500 to £2,000. The outstanding world champion was Edward Hanlan of Toronto, who defeated the best scullers of Canada, the U.S., England and Australia. As the distinction between professional and amateur rowing became more sharply drawn, following the lead of England, Canada developed numerous amateur rowing clubs, among them the famous Argonauts of Toronto. There is a Royal Canadian Henley regatta held annually at Port Dalhousie, Ont.

United States.—In the United States, as in England, rowing as a competitive sport originated in contests between "occupational" oarsmen. In 1811 and 1823 the ferryman of Whitehall in New York city defeated their Long Island and Staten Island rivals on the Hudson. In 1824 they outrowed a crew of Thames watermen from the visiting British frigate "Hussar," in a four-mile race finishing at the Battery. This international race aroused tremendous local interest and the betting far exceeded the original stake of \$1,000 offered by the captain of the "Hussar." Light keelless racing shells soon displaced the service boats of the early contests. The cleavage between amateur and professional, following the organization of the National Association of Amateur Oarsmen (N.A.A.O.) in 1872, inaugurated the golden age of professional sculling. Among the scullers who won national and international fame were James Hamill, J. A. Ten Eyck, Wallace Ross, George Hosmer, Fred A. Plaisted, Walter Brown and Joshua Ward. The four Ward brothers had won an international race at Saratoga, N.Y., in 1871. Charles Courtney, who had begun as an amateur, turned professional and became the leading rival of the great Canadian Hanlan for championship honours and rewards. He was defeated by Hanlan in an exciting race at Lachine, Ont., in 1878. A return match for a purse of \$6,000 at Lake Chataqua was never rowed because Courtney's shell was found hacked in two on the morning of the race. This fiasco and the suspicion that betting and shady "deals" influenced the results of races were responsible for the decline of professional sculling in the United States. Courtney's later reputation was based on his success as coach of the Cornell crews, as was Ten Eyck's as coach of the Syracuse university crews for 35 years.

Amateur Clubs.—The first organization of amateur clubs was the Castle Garden Boat Club association of New York (1834); pleasure boating rather than racing was the main interest of these early clubs, their membership being based on social rather than aquatic prestige. The Detroit Boat club, 1839, the oldest survivor of these early clubs, is today one of the most important members of the N.A.A.O. and has entered crews in many regattas. In 1858 the boat clubs along the Schuylkill river, Philadelphia, Pa., were organized as the Schuylkill Navy. The boathouses of the

Navy stretch for nearly a quarter-mile along the banks of the river in Fairmount park, and until the silting up of the river, the Schuylkill course was one of the most popular and picturesque in the U.S., during the years when Philadelphia was a centre of the two great English sports of cricket and rowing. The first regatta to which only amateur oarsmen were admitted followed the organization of the N.A.A.O. in 1872 and was rowed on the Schuylkill under the auspices of the Schuylkill Navy. The N.A.A.O. thereafter was the chief promoter of rowing among the amateur clubs, holding annual regattas for the championship of the United States in singles, doubles, quadruples, fours and eights.

Intercollegiate Rowing.—The first formal intercollegiate boat race was rowed between Harvard and Yale in 1852 on Lake Winnepesaukee. In 1944, because of the use of the New London course by the United States navy, the race was shortened to two miles and rowed on the Housatonic river. The Yale-Harvard boat race is the oldest college contest in the United States and antedates football by 17 years.

In the 1870s rowing became popular at a number of eastern colleges. In 1875 there was a regatta on Saratoga lake in which 13 colleges participated. When Yale and Harvard in 1878 went to New London for their dual race, Lake George became the scene of college races in fours in which Cornell or Pennsylvania generally won, Wesleyan, Bowdoin, Columbia and Princeton affording good competition. In 1887 eights took the place of fours, and, until the establishment of the Poughkeepsie regatta in 1895, these races were rowed at New London, Cayuga lake, Lake Minnetonka and one on the Delaware at Torresdale (1894). From the inauguration of the four-mile race at New London, Harvard and Yale regarded this as the culmination of their rowing season. Though the record of the Cornell crews in the 1890s, the defeats of Yale and Harvard by Cornell and Princeton crews in the decade 1911-21, and the appearance of California and Washington and the U.S. Naval academy at Poughkeepsie challenged the leadership in college rowing that formerly could fairly be claimed by Harvard and Yale, the picturesqueness of the New London course, the tradition of the race and the prestige of Yale and Harvard among U.S. universities continued to surround the Harvard-Yale boat race with an interest analogous to that surrounding the Oxford-Cambridge race in England, the one rowed on the English Thames at London and the other on the United States Thames at New London. In 1895 Cornell, Columbia, Syracuse and Pennsylvania joined in a rowing association with annual regattas open to invited crews at Poughkeepsie. The Poughkeepsie regatta continued not only to attract the foremost eastern college crews; it also brought to the Hudson winning eights from the universities of California, Washington and Wisconsin and the United States Naval academy. Because of unsatisfactory water conditions and lack of interest, the Intercollegiate Rowing association (I.R.A.) regatta was moved to Marietta, O., for 1950 and 1951. Bad water conditions there caused its removal to Lake Onondaga, Syracuse, N.Y., where a satisfactory regatta, the 50th anniversary of the New London, Poughkeepsie regatta, the 50th anniversary of the New London, Poughkeepsie has had as many as nine starters in the interuniversity race. From 1895 to 1915 Cornell led in number of victories. Since the entrance of the U.S. Naval academy, Washington and California, these have been the most frequent winners.

Rowing was established on the Pacific coast in 1899. The first race, in fours, was between Washington and California. In 1907 eights displaced fours, and the Washington-California race, alternating between Lake Washington and the estuary at Oakland, Calif., became the rowing feature in the far west, and these crews soon began winning laurels at Poughkeepsie and in Olympic competitions. The favourable climatic conditions, the abundance of material in the open the year round, the program of rowing developed in the great state universities and the program of rowing developed in the western universities all contributed to the enviable record of the western crews.

Princeton had abandoned rowing in 1884, but, as a result of Andrew Carnegie's gift of a lake formed by the damming of two streams and affording 3½ mi. of rowing water, resumed the sport in 1910. At this time the only races that college crews trained

for were the long-distance contests at New London and Poughkeepsie. Princeton's revival of rowing was responsible for the inauguration of a series of short-distance races, 1½ to 2 mi., rowed on college waters and during term time, generally participated in by three crews and called triangular races. In 1912 the Childs cup race, next to the Yale and Harvard race the oldest intercollegiate fixture, was revived. This trophy had been given in 1879 by George W. Childs, the publisher of the *Philadelphia Ledger*, to be competed for by Columbia, Princeton and Pennsylvania, but the race had lapsed after 1884. In 1911 Princeton inaugurated intercollegiate rowing on Lake Carnegie with a triangular race between Yale, Cornell and Princeton, in which Princeton defeated Yale and came in as a close second to a fast Cornell crew that later won at Poughkeepsie. The Carnegie cup offered for this race in 1911 came into annual competition. Later a race between Yale, Columbia and Pennsylvania for the Blackwell cup and between the U.S. Naval academy, Pennsylvania and Harvard for the Adams cup became annual fixtures. All these races are alternately rowed on college waters, on Lake Cayuga, Lake Carnegie, the Charles river, the Housatonic river, the Schuylkill river and the Severn river at Annapolis, and before the close of the spring term. Later, Syracuse university and Massachusetts Institute of Technology also participated.

An annual regatta conducted by a group of smaller colleges under the name of the Dad Vail Rowing association, in honour of a former coach of Wisconsin, is participated in by Amherst college, Boston university, Dartmouth college, Florida Southern college, La Salle college, Marietta college, Rollins college, Rutgers university and the University of Tampa.

The increased interest in rowing at the colleges led to the organization of lightweight crews averaging 150 lb. per man. Some of these crews made up in skill and speed for lack of weight, and in competing at the Royal Henley for the Thames Challenge cup defeated in trial heats some of the best English college crews.

Rowing became a highly popular sport among both public and private schools. U.S. schoolboy crews have won the Thames cup at Henley. There are various regattas especially for school crews and attracting numerous entries.

In 1904 the American Rowing association was formed to increase intercollegiate competition by means of short-distance races in the early season, concluding with an annual regatta at the Henley distance of 1 mi. 550 yd. Thus this regatta became popularly known as the American Henley. This association, with the introduction of short-distance races, did a great deal to stimulate college rowing. It likewise had events at its annual regatta open for club crews who thereby matched their skill against college crews.

U.S. College Crews in Europe.—In 1869 Harvard challenged Oxford and Cambridge to a four-oared race on the Thames from Putney to Mortlake; Oxford accepted and won.

In the only other interuniversity race between English and Americans, Cambridge in 1906 defeated Harvard by about two lengths. There have been many U.S. entries at Henley. In 1878 a four from Columbia university won the Visitors' cup. In 1881 a Cornell four was defeated for the Stewards' cup, and in 1895 a Cornell eight lost to Trinity hall, Cambridge. In 1896 Leander beat a Yale crew coached by Bob Cook. In 1901 a University of Pennsylvania eight lost by a few seconds to Leander in the finals for the Grand Challenge cup. In 1914 the survivors in the finals for the Grand Challenge cup were Harvard and the Union Boat club of Boston, composed of former Harvard oarsmen; Harvard won, bringing the cup to the United States for the first time. Princeton in 1934 was defeated by Leander in the finals of the Grand Challenge; both crews broke the Henley record established in 1891. In 1939 and 1950 Harvard again brought the Grand Challenge cup to the U.S. Princeton in 1930 and 1934 and Yale and Harvard in 1938 entered 150-lb. crews for the Thames cup, which was won by Kent school in 1933, 1938, 1947 and 1950, by Tabor academy in 1936, 1937 and 1939 (both schoolboy crews) and by the University of Pennsylvania in 1951 and 1952.

Strokes, Styles and Coaches.—Sweep rowing was early differentiated from sculling in England. The so-called "English

stroke" was developed by Oxford and Cambridge oarsmen. As exemplified by the best Leander crews and described by Edmond Warre, provost of Eton (*A Grammar of Rowing*, Oxford, 1909), and R. C. Lehman of Cambridge (*The Complete Oarsman*, London, 1924), this stroke was based on early fixed-seat rowing, when body swing was the main source of power and the arms were used chiefly as connecting rods to transfer the weight of the body to the oar. When the sliding seat, an American invention, was introduced, the leg drive was added but the main stress was still on the body swing with shoulders carried well beyond the perpendicular at the finish. This required muscles which only years of practice could develop. The first challenge to this "orthodox" stroke came from a Cambridge student, Stephen Fairbairn, who had entered Jesus college from Australia in 1881 and as a member and coach of his college crews upset tradition by winning races in a style taboo to the "rigidly righteous" of the old school. Fairbairn (*Rowing Notes; Chats on Rowing*, Cambridge, 1934) emphasized leg drive and arm pull and considered smooth blade work more important than what he called the "showy style" of body work. If the proponents of the traditional stroke sometimes laid more emphasis on form than on speed, Fairbairn's stroke sacrificed form for speed.

The success of his and foreign crews was responsible for the adoption of innovations from abroad, such as the lengthened slide, the use of the swivel lock in place of tholepins and the seating of crews amidships in straight alignment instead of in the staggered order formerly used to increase leverage.

The British have devoted much time to the technical and theoretic aspects of rowing. A good exposition of the British system is G. C. Bourne's *A Text-Book of Oarsmanship*. R. C. Lehman, a leading exponent of the British system, was in 1896 invited to coach the Harvard crews. To Yale in 1914 went Guy Nickalls as head coach, and to Pennsylvania his brother Vivian. Though all these men had brilliant records as oarsmen and coaches in England and stimulated interest in rowing at the universities they visited, the English system did not permanently strike root in the U.S. Many of the dons in the English universities assist in coaching their college crews. Sir Leslie Stephen was an enthusiastic coach in his Oxford days. At Henley may frequently be seen on the towpath coaches who are equally at home among books and boats and who combine reading as a vocation with rowing as an avocation.

In the United States as in England the colleges first popularized rowing as a competitive amateur sport. The first college coaches were former professional scullers. Charles Courtney at Cornell, Ellis Ward at Pennsylvania, Edward Hanlan Ten Eyck at Syracuse, Richard Glendon at Annapolis, William Haines at Harvard and M.I.T. were types of "professionals" who instilled into their charges principles of honour, loyalty and courage, besides rowing technique and strict conformity to training rules.

The stroke they taught was essentially a sculling stroke adapted to sweep rowing. The first attempt to introduce a stroke differentiated from sculling and based on the scientific principles of the "English" stroke was made by Robert Cook of Yale, who, as an undergraduate in 1881, when captain of his crew, went to England and studied the system prevailing at Oxford and Cambridge. The Yale crews of the next 20 years coached by him were noted both for speed and form. The "Bob Cook" stroke was characterized by a hard catch with squared shoulders, straight back, straight arms, quick hand shoot and slow slide on the recovery, length in the water and lower beat than the prevailing "sculling" strokes. After the Cornell experience at Henley in 1895, Courtney, always ready to experiment and improve both rigging and rowing, modified the short sculling stroke his crew had previously rowed, and in the Poughkeepsie regatta of 1896, in which both Yale and Harvard

participated, it was difficult to distinguish Cornell from Yale.

In later years Courtney modified the hard catch, shortened the swing at the finish and developed the slow slide and run between strokes that enabled Cornell to defeat crews rowing a much higher stroke. The advocates of the lower stroke say, "If men were machines, the crew rowing the highest stroke would always win, but men are not machines and a lower stroke and smooth form conserve power." Richard Glendon at the U.S. Naval academy taught a stroke with exaggerated swing of the body at the finish. The fine physique of the midshipmen, combined with their finished watersmanship, brought victories to this stroke at Poughkeepsie and in the Olympics. The nearest approach to what may be called an "American stroke" was made by Hiram Connibear and his pupils at the University of Washington. Connibear, himself not an oarsman, when appointed rowing coach at Washington in 1907, studied Yale, Cornell and Syracuse methods, and on his return became an expert technician as well as an inspiring leader. He developed at the University of Washington, aided by the Pocock brothers, expert builders and riggers of racing shells, a system that by the 1940s dominated college rowing east and west. Edward Leader at Yale, Thomas Bolles at Harvard, Fred Spohn at Princeton, Russell Callow at Pennsylvania, Harrison Sanford at Cornell, Alvin Ulbricksen at Washington, Carroll Ebright at California, Robert Mock at Massachusetts Institute of Technology and Charles Logg at Rutgers were all products of the University of Washington and as coaches belonged to what fairly may be called the "Washington school" of rowing. As a matter of fact, there were only a few universities whose coaches were not former Washington oarsmen; viz., Edward Hanlan Ten Eyck of Syracuse, Charles S. Walsh of the U.S. Naval academy, Hubert Glendon of Columbia and Allen W. Walz of Wisconsin.

While in England college coaches are "invited" by the captains of crews or boat clubs, in the United States intercollegiate athletics became increasingly subject to faculty control, and coaches of major sports such as football and rowing are appointed by college authorities and considered part of the salaried staff of the institution. They are usually college graduates who have as amateurs been active in the sport they direct. A similar departure from the earlier system of professional coaching took place in the boat clubs.

Robert F. Herrick at Harvard, Averell Harriman and Mather Abbott at Yale, J. Duncan Spaeth and Gordon Sikes at Princeton and Father Sill at Kent acted as volunteer amateur coaches at their institutions; similar examples among the rowing clubs could be noted. However, the system of salaried but otherwise nonprofessional coaches described above became prevalent in the United States.

Governing Bodies and the Olympic Games.—The first duty of the governing bodies for rowing in each nation is to establish an amateur rule specifying the qualifications necessary for anyone to engage in amateur rowing competition. The governing body's authority and rulings must be respected by the organizations and individuals participating in the sport, and it must have power to disqualify and suspend those who violate the amateur status or other rules prescribed for rowing competition.

It is also the responsibility of the national governing body in each nation to hold a championship regatta each year which shall be open to all classes that are eligible under the amateur rule.

Winners of Singles and Eights in Olympic Regattas

Year*	Place	Singles		Eights	
		Winner	Country	Winner	Country
1900	Paris	Barrelet	France	Vesper Boat club	U.S.
1904	St. Louis	F. H. Greer	U.S.	Vesper Boat club	U.S.
1908	London	H. T. Blackstaffe	England	Leander	England
1912	Stockholm	W. D. Kinser	England	Leander	England
1920	Antwerp	J. B. Kelly	U.S.	U.S. Naval academy	U.S.
1924	Paris	J. H. Bredford, Jr.	England	Yale university	U.S.
1928	Amsterdam	R. K. Pearce	Australia	University of California	U.S.
1932	Los Angeles	H. K. Pearce	Australia	University of California	U.S.
1936	Berlin	G. Schaeffer	Germany	University of Washington	U.S.
1948	London	M. Wood	Australia	University of California	U.S.
1952	Helsinki	J. Tjukalov	U.S.S.R.	U.S. Naval academy	U.S.

*In 1916, 1920 and 1944 there were no Olympic games.

It is also the duty of the governing body, which in the U.S. is the Olympic Rowing committee, to conduct tryouts every four years to select those who are to compete in the International Olympic regatta.

The National Association of Amateur Oarsmen is the governing body in the U.S. for the clubs. For college rowing the Intercollegiate Rowing association and the Eastern Association of Rowing Colleges are the governing bodies in all regattas. In Canada it is the Canadian Association of Amateur Oarsmen, and in Great Britain it is the British Amateur Rowing association.

For international competition, the International Rowing federation, whose exact name is the *Fédération Internationale Sociétés d'Aviron* (F.I.S.A.), is composed of the recognized national rowing organization in each nation. The International Rowing federation is the only organization that is recognized by the International Olympic committee; it is given charge of organizing and conducting the rowing competition in the Olympic games which are held every four years. In addition to this the international federation conducts a European championship regatta every year. At this regatta entries are accepted only from the nations whose governing bodies are members of the international federation. For the Olympic regatta, entries from any nation are acceptable providing that the amateur status of the oarsman entered is in accordance with the Olympic rules.

There are seven events on the Olympic program; viz., single sculls, double sculls, pair-oared shells without coxswain, pair-oared shells with coxswain, four-oared shells without coxswain, four-oared shells with coxswain and eight-oared shells. The distance at the Olympic regatta is 2,000 m., or 13 yds. less than 14 mi. As in most regattas, the two principal events are the single sculls and the eight-oared shells.

Thirty-three nations competed in the XVth Olympiad rowing events at Helsinki, Fin., in 1952. There were 114 entries in the seven events. The National Association of Amateur Oarsmen was organized in 1872 in order to make a necessary distinction between amateur and professional competition. There was much professional rowing up to that time; amateurs and professionals were competing together and it was necessary that some means be found to meet this situation. The same condition in other sports prompted similar governing organizations for the same purpose. The association is composed of clubs and rowing organizations throughout the United States. Actual administration of the association is vested in an executive committee of 19.

Outstanding Oarsmen.—Records.—Recent years have produced three most outstanding English oarsmen were Guy Nickalls, Sr., who won the Diamonds five times and stroked pairs, fours and eights to victory many times at Henley; F. S. Kelly, a great sculler who won the Diamonds three times; and J. Beresford, Jr., who won the Diamonds four times and competed in five Olympic regattas, being a victor in three and second in two.

Among the oarsmen of the United States, perhaps the most outstanding have been Edward Hanlan Ten Eyck, John B. Kelly, Paul Costello, Walter M. Hoover, Joseph W. Burk and Joseph Angyal. Kelly was the most versatile. In addition to winning three Olympic championships, he stroked pairs, fours and eights to victory many times. Burk made a most remarkable record in single sculling. In four years, 1937-40 inclusive, he won a total of 46 races in single sculls. These included the United States national championship four times, the Canadian championship four times, the Diamond Sculls twice and the Philadelphia Gold Challenge cup. He was voted the most outstanding athlete in the United States in 1939 when he was awarded the James E. Sullivan trophy.

In Canada, the dean of rowing and the most outstanding was Joseph Wright, Sr., of the Argonaut Rowing club, who won many races as stroke of pairs, fours and eights and as such competed at Henley five times. Other outstanding Canadian oarsmen were Lou Scholes, first Canadian to win the Diamonds, Robert Dibble, Joseph Wright, Jr., and later H. R. Pearce; the last represented Australia in his first Olympic competition in 1928 and thereby under the rules was required to represent Australia in 1934, although he had in the meantime transferred his residence to Canada.

Australia produced many good crews and scullers. An Australian crew won the Grand Challenge cup at Henley and the Diamond Sculls. In single sculling, the most outstanding was H. R. Pearce, who won the Olympic single sculls championship in 1928 and 1932, and Mervyn Wood, who was world champion single sculler for nearly a decade until his defeat at the XVth Olympiad in 1952 by J. Tjukalov of the U.S.S.R.

ROWLAND, HENRY AUGUSTUS (1848-1901), U.S. physicist, was born at Honesdale, Pa., on Nov. 27, 1848. He graduated as a civil engineer at Rensselaer Polytechnic Institute at Troy in 1870, and two years later returned there as instructor in physics, becoming assistant professor in 1877. While at Troy he made investigations on magnetic induction, permeability and distribution, which established fundamental results. In 1875 he was chosen to occupy the chair of physics in the newly founded Johns Hopkins university, a position which he held until his death, at Baltimore, on April 16, 1901. Before beginning his work at Johns Hopkins he went to Europe, to visit the various physics research centres of the continent, and to purchase laboratory apparatus. He studied under Helmholtz in Berlin, where he carried out experiments proving that an electrostatic charge carried at a high rate of speed had the same magnetic action as an electric current. At Johns Hopkins he carried on a long series of experiments in which he computed the accepted value of the mechanical equivalent of heat, experiments which necessitated more careful thermometric and calorimetric methods than had ever been used before. Similar refined apparatus and technique enabled him to make a more nearly accurate determination of the value of the ohm, than had been calculated before. Becoming interested in the study of spectrum analysis, he realized the importance of securing more accurate diffraction gratings, and to this end constructed a dividing engine which allowed from 14,000 to 20,000 grating lines to be ruled to the inch on a plane surface of either glass or speculum metal. He next investigated the action of a grating ruled on a spherical concave surface, and, discovering the advantages proceeded to rule them. These gratings came to be used in physics laboratories the world over, and the modern study of spectroscopy as an exact science dates from this work. With these gratings Rowland studied and photographically mapped the solar spectrum for the first time. He then undertook the systematic study of the arc-spectra of all the elements so far as possible, and published his results between 1895 and 1900. In his last years he became interested in alternating currents and their practical application to motors, measuring instruments, etc. He devised a system of multiplex telegraphy depending upon synchronous motors which received a grand medal at the Paris Exposition of 1900. He was the recipient of many honours, including the Rumford and Draper medals.

See H. A. Rowland, *Physical Papers* (1902), which contains a bibliography of his writings.

ROWLANDSON, THOMAS (1756-1827), English caricaturist, was born in Old Jewry, London, in July 1756, the son of a tradesman or city merchant. On leaving school he became a student in the Royal academy, but at the age of 16 he went to study in Paris, and afterwards made frequent tours on the continent. In 1775 he exhibited at the Royal academy a drawing of "Delilah Visiting Samson in Prison." He took to drawing caricatures as a means of livelihood. His academy drawing of Vauxhall (1784) had been engraved by Pollard, and the print was a success. Rowlandson was largely employed by Rudolph Ackermann, the art publisher, who in 1809-11 issued in his *Poetical Magazine* "The Schoolmaster's Tour"—a series of plates with verses by Dr. William Coombe which became very popular. Again engraved by Rowlandson himself in 1812, and issued under the title of the "Tour of Dr. Syntax in Search of the Picturesque," they had reached a fifth edition by 1813, and were followed (1820) by "Dr. Syntax in Search of Consolation," and (1821) by the "Third Tour of Dr. Syntax in Search of a Wife." The same collaboration of designer, author and publisher resulted in the English "Dance of Death" (1814-16), and the "Dance of Life" (1822). Rowlandson also illustrated Smollett, Goldsmith and Sterne. Other designs are in *The Spirit of the Public Journals* (1825), *The English Spy* (1825), and *The Humourist* (1831). He died in London on April 22, 1827.

Rowlandson's designs were usually executed in outline with the reed-pen, and delicately washed with colour. They were then etched by the artist on the copper, and afterwards aqua-tinted—usually by a professional engraver, the impressions being finally coloured by hand. As a designer the quality of his work suffered from haste and over-production.

See J. Grego, *Rowlandson the Caricaturist, a Selection from his Works*, etc. (2 vols., 1880).

ROWLEY, WILLIAM (c. 1585–c. 1642), English actor and dramatist, collaborator with several of the dramatists of the Elizabethan period, especially with Thomas Middleton (*q.v.*). He is not to be identified with the "Master Rowley," whom Francis Meres described in his *Palladis Tamia*. William Rowley is described as the chief comedian in the Prince of Wales's company. He joined the King's Servants in 1623, and retired from the stage about four years later. He is supposed to have died about 1642. The following plays attributed to his sole authorship are extant: *A new Wonder, A Woman never Vext* (printed, 1632); *A Match at Midnight* (1633); and *A Shoemaker a Gentleman with the Life and Death of the Cripple that stole the Weathercock at Pauls* (1637). They are distinguished by effectiveness of situation and ingenuity of plot. It is recorded by Langbaine that he "was beloved of those great men Shakespeare, Fletcher and Jonson." With George Wilkins and John Day he wrote *The Trauaises of the Three English Brothers* (1607); with Thomas Heywood he produced *Fortune by Land and Sea* (printed, 1655); he was associated with Thomas Dekker and John Ford in *The Witch of Edmonton* (printed, 1658); *A Cure for a Cuckold* (printed, 1661); and *The Thracian Wonder* (printed, 1661) are assigned to the joint authorship of Webster and Rowley; while Shakespeare's name was unjustifiably coupled with his on the title-page of *The Birth of Merlin*; or, *The Child hath found his Father* (1662). Rowley also wrote an elegy on Hugh Attwell, the actor, and a satirical pamphlet describing contemporary London, entitled *A Search for Money* (1609).

SAMUEL ROWLEY, the dramatist, described without apparent reason by J. P. Collier as William Rowley's brother, was employed by Henslowe as a reader of plays. He wrote some scriptural plays now lost, with William Borne (or Bird, or Boyle) and Edward Juby. His only extant pieces are: *When you see me, You know me, Or the famous Chronicle Historie of King Henry the eighth, with the birth and veruious life of Edward Prince of Wales* (1605), of interest because of its possible connection with the Shakespearean play of *Henry VIII.*, and *The Noble Souldier, Or, A Contract Broken, justly reveng'd* (1634), which was entered, however, in the Stationers' Register as the work of Thomas Dekker, to whom the major share is probably assignable.

ROWLEY REGIS, municipal borough (1933), Kingswinford, parliamentary division, Staffs., England, on the G.W. ry., 7 mi. W. of Birmingham. Pop. (1938) 44,190. Area 6 sq.mi. It lies in a hilly district rich in coal and iron, while a basaltic intrusion, Rowley rag, is quarried for road metal.

ROWLOCK (pronounced in England *rollock*), a device, on the gunwale of a boat, in or on which an oar rests, forming a fulcrum for the oar in rowing. The word is a corruption due to "row" of the earlier "oar-lock." O.E. *ārloc*, a lock or enclosed place for an oar. The simplest form of rowlock is a notch, square or rounded, on the gunwale, in which the oar rests; other kinds are formed by two pins or pegs, "thole pins" (thole being ultimately the same word as Norw. *toll*, a young fir-tree), and by a swivel with two horns of metal, pivoted in the gunwale or on an out-rigger. (See *ROWING*.)

ROWNO, a town of Poland, in the province of Volhynia, on a tributary of the Goryn. Pop. (1931), 40,788. Though it never had the political importance of Luck or Ostrog, Rowno grew to be a larger town than either of these. It is an important railway junction, the centre of an agricultural district, and the Volhynian town with the largest Jewish population. It is one of the chief centres of the textile industry in Poland, with a large rayon and cotton textile industry. It is also a centre of the leather and fur industry. It was taken by the U.S.S.R. in 1939 and German in 1941.

ROWTON, MONTAGUE WILLIAM LOWRY-CORRY, 5th earl of Roxburghe (c. 1750–1821), British statesman and diplomat. He was the son of Sir Richard Lowry-Corry, 4th baronet, and his wife, the daughter of Sir George Corry, 1st baronet. He was educated at Eton and Christ Church, Oxford. He served in the army and was promoted to the rank of lieutenant-general. He was a member of the House of Commons from 1781 to 1783 and of the House of Lords from 1783 to 1821. He was a member of the Privy Council from 1783 to 1821. He was a member of the House of Commons from 1781 to 1783 and of the House of Lords from 1783 to 1821. He was a member of the Privy Council from 1783 to 1821.

parliament continuously from 1826–1873, and was a member of Lord Derby's cabinet (1866–68) as vice-president of the council and afterwards as first lord of the Admiralty. In 1866 he became private secretary to Disraeli, with whom he maintained intimate relations until the statesman's death in 1881. When Disraeli resigned office in 1868 Corry declined various offers of public employment in order to be free to continue his services, now given gratuitously, to the Conservative leader; and when the latter returned to power in 1874, Corry resumed his position as official private secretary to the prime minister. He accompanied Disraeli (then earl of Beaconsfield) to the congress of Berlin in 1878, where he acted as one of the secretaries of the special embassy of Great Britain. On the defeat of the Conservatives in 1880, Corry was raised to the peerage with the title of Baron Rowton, of Rowton Castle, Shropshire. After Beaconsfield's removal to the House of Lords, Rowton assisted him in keeping in touch with the rank and file of the party, and on Beaconsfield's death he was put in charge of his correspondence and papers.

Lord Rowton will long be remembered as the originator of the scheme known as the Rowton houses. Consulted by Sir Edward Guinness (afterwards Lord Iveagh) with regard to the latter's projected gift of £200,000 for endowment of a trust for the improvement of the dwellings of the working classes, Rowton made himself personally familiar with the conditions of the poorest inhabitants of London; and determined to establish "a poor man's hotel," which should offer better accommodation than the common lodging-houses, at similar prices. The first Rowton House was opened at Vauxhall in Dec. 1892, the cost (£30,000) being defrayed by Lord Rowton and it proved so successful that in 1894 a company, Rowton Houses (Limited), was incorporated to extend the scheme which was subsequently imitated throughout Great Britain, Europe and America. Lord Rowton also devoted himself to the business of the Guinness trust, of which he was a trustee. As he was unmarried the title became extinct on Lord Rowton's death on Nov. 9, 1903, at London.

See *Reports of the Rowton Houses, Ltd.*, 1895–1903; E. R. Dewar, *The Housing Problem in England* (1907); R. H. Vebch, *General Sir Andrew Clarke* (1905).

ROXANA or **ROXANE**, daughter of the Bactrian king Oxyartes, and wife of Alexander the Great. After the latter's death she gave birth at Babylon to a son (Alexander IV.), who was accepted by the generals as joint-king with Arrhidæus. Having crossed over to Macedonia, and thrown in her lot with Olympias, mother of Alexander the Great, she was imprisoned by Cassander in the fortress of Amphipolis and put to death (310 or 309 B.C.). The marriage of Alexander and Roxana was the subject of a famous painting by Aëtion.

See Plutarch, *Alexander*, 47, 77; Arrian, *Anab.* iv, 28, vii, 27; Diod. Sic. xviii, 3, 38, xix, 11, 52, 105; Strabo xl, p. 517, xvii, p. 794.

ROXBURGHE, EARLS AND DUKES OF. **ROBERT KER**, 1st earl of Roxburghe (c. 1570–1650), was the eldest son of William Ker of Cessford (d. 1606) and the grandson of Sir Walter Ker (d. c. 1584), who fought against Mary queen of Scots both at Carberry Hill and at Langside. He was descended from Sir Andrew Ker of Cessford (d. 1526) who fought at Flodden and was killed near Melrose in Jan. 1526 by the Scots of Buccleuch. After a turbulent life on the border Robert Ker became a Scottish privy councillor in 1599 and was made Lord Roxburghe about the same time; he accompanied King James to London in 1603, and was created earl of Roxburghe in 1616. He was lord privy seal for Scotland from 1637 to 1649, and in the Scottish parliament he showed his sympathy with Charles I.; but he took no part in the Civil War, although he signed the "engagement" for the king's release in 1648. His titles and estates passed by special arrangement to his grandson, **WILLIAM DRUMMOND** (d. 1675), the youngest son of his daughter Jean and her husband John Drummond, 2nd earl of Perth. William took the name of Ker, became 2nd earl of Roxburghe, and married his cousin Lord Ker's daughter Jean.

JOHN, 5th earl and 1st duke of Roxburghe (c. 1680–1741), received the dukedom in 1707 for his services in connection with the Union. This was the last creation in the Scottish peerage.

The duke was a representative peer for Scotland in four parliaments; George I made him a privy councillor and keeper of the privy seal of Scotland, and he was loyal to the king during the Jacobite rising in 1715. He was again a secretary of state from 1716 to 1725.

His grandson JOHN, 3rd duke of Roxburghe (1740-1804), was a famous bibliophile. The duke's library, including a unique collection of books from Caxton's press, and three rare volumes of broadside ballads, was sold in 1812, when the Roxburghe club was founded to commemorate the sale of Valdafer's edition of Boccaccio. Roxburghe's cousin William, 7th Lord Bellenden (c. 1728-1805), who succeeded to the Scottish titles and estates, died childless in October 1805, and for seven years the titles were dormant.

Then in 1812 SIR JAMES INNES, Bart. (1736-1823), a descendant of the 1st earl, established his claim to them, and taking the name of Innes-Ker, became 5th duke of Roxburghe. In his family the dukedom remained. Its holder has a seat in the house of lords as Earl Innes in the peerage of the United Kingdom.

ROXBURGHSHIRE, border county, Scotland, bounded west by Berwickshire, east and southeast by Northumberland, south by Cumberland, southwest by Dumfriesshire and northwest by Selkirkshire and Midlothian. It has a land area of 426,012 ac., or 665.6 sq.mi. The only low ground is in the north and in the valleys of the larger rivers, and the whole of the south is markedly hilly, though the Cheviots, forming for a considerable distance the natural boundary with England, mostly belong to Northumberland. The Tweed flows through the north of the shire for 26 out of its total run of 97 mi., though for about 2 mi. (near Abbotsford) it is the boundary stream with Selkirkshire, and for 10 mi. lower down with Berwickshire. On the right its affluents are the Bowden and the Teviot, and on the left the Allan and the Eden. The Teviot is the principal river entirely in Roxburgshire. From its source near Causeway Grain Head on the Dumfriesshire border, it follows mainly a northeasterly direction of 37 mi. to its confluence with the Tweed at Kelso. The Liddel is the main stream in the south. Rising near Peel Fell in the Cheviots it flows southwest to the Esk after a course of 27 mi., receiving on the right Hermitage Water, on the left Kershope Burn. The Kershope and Liddel, during part of their run, serve as boundaries with Cumberland. Excepting the Liddel, which drains to the Esk, much the greater portion of the surface is drained, by the Tweed, to the North sea. Teviotdale, Liddesdale, Tweedside and Jedvale are the principal valleys. The county contains a considerable range of sedimentary rocks from the Ordovician to the Carboniferous systems, and with these are associated large tracts of volcanic rocks. The Ordovician and Silurian rocks occupy the N.W. and W. part of the county. Two divisions of the Old Red Sandstone occur; the lower is confined to the Cheviots; the strata are unconformable upon the upturned Silurian beds. The upper division, which in its turn is unconformable upon the lower, occupies about one-third of the county, being well developed in the north, where volcanic rocks come in. Carboniferous rocks are represented by the Calciferous sandstone series in the southwest in Liddesdale and on the uplands of Carter Fell, etc. An interesting series of volcanic "necks" belonging to the Carboniferous period is exemplified in Dunain Law, Black Law, Maiden Paps, Ruberslaw and other hills. Glacial deposits are represented by boulder clay and beds of sand and gravel.

History and Antiquities.—Among the more important remains of the original inhabitants are the standing stones and circles at Plenderleith between the Kale and Oxnam; on Hownam Steeple, a few miles to the northwest; and at Midshiels on the Teviot. The stones on Ninestane Rig, near Hermitage Castle, and on Whisgill are supposed to commemorate the Britons of Strathclyde who, under Aidan, were defeated with great slaughter by Elhefrith, king of Bernicia, at the battle of Degansstane or Dawstane in 603. There are hill forts in Liddesdale on the Allan, in the parish of Oxnam, and on the most easterly of the three Eildons. This last is said to be the largest example of its kind in Scotland. One of the most important and most mysterious of British remains is the Catrail, or Picts' Work Dyke. In its orig-

inal condition it is supposed to have consisted of a line of double mounds or ramparts, with an intervening ditch 6 ft. broad. It is now far from perfect and in places has disappeared for miles. Beginning at Torwoodlee, northwest of Galashiels, it ran south-west to Yarrow church, whence it turned first south and then southeast, following a meandering course to Peel Fell in the Cheviots, a distance of 48 mi. Roman remains are also of interest. Dere street crossed the border north of Brownhart Law in the Cheviots, then took a mainly northwestern direction across the Kale, Oxnam, Jed and Teviot to Newstead, near Melrose, where it is conjectured to have crossed the Tweed and run up Lauderdale into Haddingtonshire. Another so-called Roman road is the Wheel Causeway or Causey, a supposed continuation of the Maiden Way which ran from Overburgh in Lancashire to Bewcastle in Cumberland, and so to the Border. It entered Roxburgshire north of Deadwater and went (roughly) north as far as Wolflee, whence its direction becomes a matter of surmise. Of Roman camps the principal appear to have been situated at Cappuck, to the southeast of Jedburgh, and near Newstead, at the base of the Eildons, the alleged site of *Trimontium*. After the retreat of the Romans the country was occupied by the Britons of Strathclyde in the west and the Bernicians in the east. It was then annexed to Northumbria for over four centuries until it was ceded, along with Lothian, to Scotland in 1018.

David I constituted it a shire, its ancient county town of Roxburgh (see Kelso) forming one of the Court of Four Burghs. The castle of Roxburgh, after changing hands more than once, was captured from the English in 1460 and dismantled. Other towns were repeatedly burned down, and the abbey of Dryburgh, Jedburgh, Kelso and Melrose ultimately ruined in the expedition of the earl of Hertford (the Protector Somerset) in 1544-45. The Border freebooters—of whom the Armstrongs and Elliots were the chief—conducted bloody frays on their own account.

Agriculture and Industries.—The soil is chiefly loamy in the level tracts along the banks of the larger streams, where it is also very fertile. In other districts a mixture of clay and gravel is mostly found, but there is besides a considerable extent of mossy land. Of the area under grain about 68% was occupied by oats in 1938, the remainder being barley and wheat in roughly equal quantities. Among green crops turnips and swedes are most generally cultivated (12,202 ac. in 1928), potatoes covering a comparatively small acreage. In some parts of Tweedside and Jedvale several kinds of fruit are successfully grown. Both in the pastoral and arable localities agriculture is in an advanced condition. The hill country is everywhere covered with a thick green pasture admirably suited for sheep, which occupy the walks in large numbers (591,703 in 1938). The herds of cattle are also heavy, horses are kept mostly for farming operations, and pigs are raised in moderate numbers. About 42% of the 1,123 holdings in 1938 were over 100 ac., the average being 156 ac. Many districts on the Tweed and Teviot are beautifully wooded.

The county is a principal seat of the tweed and hosiery manufactures in Scotland. Ironfounding and dyeing are also carried on at Hawick and tanning at Jedburgh, and agricultural implements, chemical manures and fishing tackle are made at Kelso. The salmon fisheries on the Tweed are of considerable value.

The Waverley route of the L.N.E. railway runs through the county near from Melrose in the north to Kershopefoot in the south. At St. Boswells branches are sent off to Duns and Reston, and to Jedburgh and Kelso via Roxburgh. There is also a line from Berwick to Kelso, via Coldstream and Carham.

Population and Administration.—The population was estimated in 1938 at 45,783. In 1931 it was 45,787, and there were 97 persons who spoke Gaelic and English, but none Gaelic only. The small burghs are Hawick (est. 1938 pop. 17,102), Kelso (3,864), Jedburgh (3,477), the only royal burgh and the county town, and Melrose (2,052). The four county districts have the same names. The county returns one member to parliament with Selkirkshire. The shires of Roxburgh, Berwick and Selkirk form a sheriffdom, and a resident sheriff-substitute sits at Jedburgh and Hawick. The county is under school-board jurisdiction, and there are secondary schools at Hawick and Jedburgh.

ROXBURY, formerly a city of Norfolk county, Massachusetts, U.S.A., situated between Boston and Dorchester, but since 1868 a part of Boston. It is primarily a residential district. The town of Roxbury (at first usually spelled Rocksbury) was founded in 1630 by some of the Puritan immigrants who came with Gov. John Winthrop; the settlers were led by William Pynchon, who in 1636 led a party from there and founded Springfield, Mass. At the home of Thomas Welde (d. c. 1662), the first minister, Anne Hutchinson (q.v.) was held in custody during the winter of 1637-38. Associated as teacher with Welde and his successors, Samuel Danforth and Nehemiah Walter, was John Eliot, the apostle to the Indians, who moved to Roxbury in 1632 and died there in 1660. Roxbury was the home also of Thomas Dudley, of his son Joseph and of his grandson Paul, of Robert Calef (d. 1719), the leader of the opposition to the witchcraft craze; of Gen. Joseph Warren, and of William Eustis (1753-1825), who was U.S. secretary of war (1809-12), and governor of Massachusetts (1823-25); and from 1837 to 1845 Theodore Parker was the pastor of the Unitarian church of West Roxbury. Of special interest in the old Roxbury burial ground is the Minister's tomb, containing the remains of John Eliot, and the tomb of the Dudleys. West Roxbury was the scene of the Brook Farm (q.v.) experiment.

The Roxbury Latin school was founded in 1645 by a group of town fathers, among them John Eliot, and was known as the Free School of Roxbury.

After several hazardous years the school progressed and grew steadily thereafter.

See F. S. Drake, *The Town of Roxbury, its Memorable Persons and Places* (Boston, 1878 and 1905).

ROY, WILLIAM (fl. 1527), English friar, studied at Cambridge university and later joined the Franciscan order at Greenwich, Eng., as a friar observant.

As secretary to William Tyndale (c. 1492-1536), Roy assisted him in the translation of the New Testament at Cologne and later at Worms, 1525-26.

Roy's works included *A litle treatise or dialogue very necessary for all Christen men to learne and to knowe* (1526, 1527-28, reprinted at Vienna, 1874); *Rede me and be nott worthe, for I say no thyng bute trothe* (Worms, 1526; Strasburg, 1528; London, 1546). An exhortation to the diligent study of scripture, made by Erasmus Roterdamus, and translated into English, to which is appended an exposition unto the seventh chapter of the first epistle to the Corinthians (Marburg, 1529); *A proper dialogue betwene a gentillman and a husbandman, eche complaynyng to other their miserable calamities through the ambition of the clergy* (Marburg, 1530; London, 1863); and *A compendious olde treatyse howe that we ought to have ye Scripture in Englyshe* (Marburg, 1530; Bristol, 1863).

ROY, WILLIAM (1726-1790), British surveyor and anti quarry, was born on May 4, 1726, at Milton Head, Lanarkshire. In 1746, as an assistant in the office of Lt. Col. David Watson, deputy quartermaster-general to the forces, he began the survey of the mainland of Scotland, the results of which were embodied in what became known as the duke of Cumberland's map.

Roy became deputy quartermaster-general to the forces, and in 1765 he was appointed surveyor-general of coasts and engineer-director of military surveys in Great Britain. Named a fellow of the Royal Society in 1767, he was appointed major general in 1781 and director and lieutenant colonel of royal engineers in 1783.

Besides his campaigns and observations in Germany, he visited Ireland in 1766 and prepared the manuscript "A General Description of the South Part of Ireland, or Observations during a Short Tour in Ireland." In 1783 he conducted observations for determining the relative positions of the French and English royal observatories. His measurement of a base line for that purpose on Hounslow Heath in 1784 gained him in 1785 the Copley medal of the Royal Society. Roy's measurements, not fully utilized until 1787, when the Paris and Greenwich observatories were properly connected, formed the basis of the topographical survey of Middlesex, Surrey, Kent and Sussex. He was finishing an account of his work when he died in London, Eng., on July 1, 1790.

His principal publication in book form was the *Military Antiquities*

of the Romans in Britain, and Particularly Their Ancient System of Castrametation Illustrated from Vestiges of the Camps of Agricola Existing There (1793).

ROYAL AGRICULTURAL SOCIETY: see AGRICULTURAL SOCIETIES AND SHOWS

ROYAL FERN, the common name for the fern *Osmunda regalis*, native to Asia, Europe (including Great Britain), North America, Mexico and South America, growing usually in bogs and marshy woods. It is a handsome plant with bi-pinnate fronds 2 to 6 ft. long and 1 ft. or more broad; the tops of the fronds are fertile, the fertile pinnae being cylindrical and densely covered with the spore-cases, giving the appearance of a dense panicle of flowers, whence the plant is known as the flowering fern. There are various cultivated forms—*cristata* has the ends of the fronds and the pinnae finely crested, and *corymbifera* has curiously forked and crested fronds. Several related species, among them *O. cinnamomea* and *O. Claytoniana*, natives of North America, are known in Great Britain as handsome greenhouse ferns.

ROYALL, ANNE NEWPORT (1769-1854), U.S. editor and traveller, born on June 11, 1769, in Maryland, spent her childhood chiefly in the frontier country of Pennsylvania. She then lived in Virginia as a domestic servant in the household of William Royall, a gentleman farmer and Revolutionary soldier, to whom she was married in 1797. After her husband's death 16 years later, she spent 10 years in litigation with other heirs over his estate and was finally left impoverished.

Although she was sponsored by John Quincy Adams in her claim for a government pension as the widow of a Revolutionary soldier, she did not receive her award, which proved very small, until 1848. In 1824 she began to support herself by publishing accounts of her extensive travels in the United States. Her books included *Sketches of History, Life and Manners in the United States, by a Traveller* (1826); *The Tennessean* (1827), an unsuccessful novel, *The Black Book, or a Continuation of Travels in the United States*, 3 vol. (1828-29); *Mrs. Royall's Pennsylvania*, 2 vol. (1829); *Mrs. Royall's Southern Tour*, 3 vol. (1830-31); and *Letters from Alabama* (1830).

Anne Royall published and edited two newspapers in Washington, D.C., *Paul Pry*, 1831-36, and *The Huntress*, 1836-54. She attacked corruption in government and was known for her vigorous and personal attacks against her opponents. She died in Washington, D.C., on Oct. 1, 1854.

See S. H. Porter, *The Life and Times of Anne Royall* (1909) and R. L. Wright, *Forgotten Ladies* (1928).

ROYAL OAK, a suburb of Detroit, Mich., U.S., located on Woodward avenue (U.S. federal highway 10). It is the shopping centre of South Oakland county and is served by the Grand Trunk railway commuter trains. Pop. (1950) 46,898; (1940) 25,087.

ROYAL PALM (*Roystonea*), a small genus of tropical American palms, formerly known as *Oreodoxa*. They occur in southern Florida and the West Indies. *Roystonea regia* is much planted as an ornamental, especially in avenues. (See PALM.)

ROYAL SOCIETY, THE, the oldest scientific society in Great Britain, and one of the oldest in Europe. The Royal Society (more fully, The Royal Society of London for Improving Natural Knowledge) is usually considered to have been founded in 1660, but a nucleus had been in existence for some years before that date. As early as the year 1645 weekly meetings were held in London of "divers worthy persons, inquisitive into natural philosophy and other parts of human learning, and particularly of what hath been called the *New Philosophy* or *Experimental Philosophy*," and there can be little doubt that this gathering of philosophers is identical with the "Invisible College" of which Boyle speaks in syndical letters written in 1646 and 1647.

Some of these "Philosophers," resident in Oxford about 1643, formed an association there under the title of the Philosophical Society of Oxford, and used to meet, most usually in the rooms of Dr. Wilkins, warden of Wadham College. A close intercommunication was maintained between the Oxford and London Philosophers; but ultimately the activity of the society was concentrated in the London meetings, which were held principally at Gresham College.

On Nov. 28, 1660, the first journal book of the society was

opened with a "memorandum," from which the following is an extract: "Memorandum that Novemb. 28, 1660, These persons following, according to the usual custom of most of them, mett together at Gresham Colledge to hear Mr. Wren's lecture, viz., The Lord Brouncker, Mr. Boyle, Mr. Bruce, Sir Robert Moray, Sir Paul Neile, Dr. Wilkins, Dr. Goddard, Dr. Petty, Mr. Ball, Mr. Rooke, Mr. Wren, Mr. Hill. And after the lecture was ended, they did, according to the usual manner, withdraw for mutual converse. Where amongst other matters that were discoursed of, something was offered about a designe of founding a Colledge for the promoting of Physico-Mathematicall Experimentall Learning." It was agreed at this meeting that the company should continue to assemble on Wednesdays at three o'clock; an admission fee of ten shillings with a subscription of one shilling a week was instituted; Dr. Wilkins was appointed chairman; and a list of forty-one persons judged likely and fit to join the design was drawn up. On the following Wednesday Sir Robert Moray brought word that the king (Charles II) approved the design of the meetings; a form of obligation was framed, and was signed by all the persons enumerated in the memorandum of Nov. 28 and by seventy-three others. On December 12, another meeting was held at which fifty-five was fixed as the number of the society—persons of the degree of baron, Fellows of the College of Physicians, and public professors of mathematics, physics and natural philosophy of both universities being supernumeraries.

Gresham College was now appointed to be the regular meeting-place of the society. Sir Robert Moray (or Murray) was chosen president (March 6, 1661), and continued from time to time to occupy the chair until the incorporation of the society, when Lord Brouncker was appointed the first president under the charter. In Oct. 1661 the king offered to be entered one of the society, and next year the society was incorporated under its present title. The name "Royal Society" appears to have been first applied to the Philosophers by John Evelyn, in the dedication of his translation of a book by Gabriel Naudé, published in 1661.

The charter of incorporation passed the Great Seal on July 15, 1662, to be modified, however, by a second charter in the following year, repeating the incorporating clauses of the first charter, but conferring further privileges on the society. The second charter passed the Great Seal on April 22, 1663, and was followed in 1669 by a third, confirming the powers granted by the second charter, with some modifications of detail, and granting certain lands in Chelsea to the society. The council of the Royal Society met for the first time on May 13, 1663.

At this early stage of its history the "correspondence" which was actively maintained with continental philosophers formed an important part of the society's labours, and selections from this correspondence furnished the beginnings of the *Philosophical Transactions* (a publication now of world-wide celebrity). At first the publication of the *Transactions* was entirely "the act of the respective secretaries." The first number, consisting of 16 quarto pages, appeared on Monday, March 6, 1664-65, under the title of *Philosophical Transactions: giving some Account of the present undertakings, studies and labours of the Ingenious in many considerable parts of the world*, with a dedication to the Royal Society signed by Henry Oldenburg, the first secretary of the Royal Society. The society also from its earliest years published, or directed the publication of, separate treatises and books on matters of philosophy; most notable among these being the *Philosophiæ naturalis principia mathematica* Autore Is. Newton. *Imprimatur: S. Pepys, Reg. Soc. Praeses. Julii 5, 1686, 4to Londini 1687.*

In 1687 the *Philosophical Transactions* were divided into two series, labelled A and B respectively, the former containing papers of a mathematical or physical character, and the latter papers of a biological character. More than 225 quarto volumes have been published. In 1832 appeared the first volume of *Abstracts of papers, printed in the Philosophical Transactions from the year 1800*. This publication developed in the course of a few years into the *Proceedings of the Royal Society*, which has been continued up to the present time.

It is, however, certain that one of the most important func-

tions of the society from the beginning was the performance of experiments before the members. In the royal warrant of 1663 ordering the mace which the king presented to the society, it is described as "The Royal Society for the improving of Natural Knowledge by experiments"; and during its earlier years the time of the meetings was principally occupied by the performance and discussion of experiments. The society early exercised the power granted by charter to appoint two "curators of experiments," the first holder of that office being Robert Hooke, who was afterwards elected a secretary of the society.

Another matter to which the society gave attention was the formation of a museum, the nucleus being "the collection of rarities formerly belonging to Mr. Hubbard," which, by a resolution of council passed in 1666, was purchased for the sum of £100. This museum, at one time the most famous in London, was presented to the trustees of the British Museum in 1781, upon the removal of the society to Somerset House. A certain number, however, of instruments and models of historical interest have remained in the possession of the society, and some of them, more peculiarly associated with its earlier years, are still preserved at Burlington House. The remainder have been deposited in the Victoria and Albert Museum, South Kensington.

After the Great Fire of London in September 1666 the apartments of the Royal Society in Gresham College were required for the use of the city authorities, and the society was invited by Henry Howard (later duke of Norfolk) to meet in Arundel House. At the same time he presented them with the library purchased by his grandfather, Thomas earl of Arundel, and thus the foundation was laid of the important collection of scientific works, now exceeding 60,000 volumes, which the society possesses. Of the Arundel mss. the bulk was sold to the trustees of the British Museum in 1830 for the sum of £3,559, the proceeds being devoted to the purchase of scientific books. These mss. are still kept in the British Museum as a separate collection. The society, however, still possesses a valuable collection of scientific correspondence, official records and other manuscripts, including the original manuscript, with Newton's autograph corrections, from which the first edition of the *Principia* was printed.

Under date December 21, 1671, the journal-book records that "the lord bishop of Sarum proposed for candidate Mr. Isaac Newton, professor of the mathematics at Cambridge." Newton was elected a Fellow Jan. 11, 1671-72, and in 1703 he was appointed president, a post which he held till his death in 1727. During his presidency the society moved to Crane Court, their first meeting in the new quarters being held Nov. 8, 1710. In the same year they were appointed visitors and directors of the Royal Observatory at Greenwich, a function which they continued to perform until the accession of William IV., when by the new warrant then issued the president and six of the Fellows of the Royal Astronomical Society were added to the list of visitors.

In 1780, under the presidency of Sir Joseph Banks, the Royal Society removed from Crane Court to the apartments assigned to them by the government in the new Somerset House, where they remained until they removed to Burlington House in 1857. The policy of Sir Joseph Banks was to render the Fellowship more difficult of attainment. A step in pursuance of the same policy was taken in the year 1847, when the number of candidates recommended for election by the council was limited to fifteen, and the election was made annual. This limitation has remained in force up to the present time. Concurrent with the gradual restriction of the Fellowship was the successive establishment of other scientific bodies. The founding of the Linnean Society in 1788 under the auspices of several Fellows of the Royal Society was the first instance of the establishment of a distinct scientific association under royal charter, and this has been followed by the formation of the large number of societies now active in the promotion of special branches of science.

From the time of its royal founder onwards the Royal Society has constantly been appealed to by the government for advice in connection with scientific undertakings of national importance. The following are some of the principal matters of this character upon which the society has been consulted by, or which it has

successfully urged upon the attention of the government: the improvement and equipment of the Royal Observatory, Greenwich, in 1710, when it was placed in the sole charge of the society; the change of the calendar in 1753; ventilation of prisons; protection of buildings and ships from lightning; measurement of a degree of latitude; determination of the length of a pendulum vibrating seconds; comparison of the British and French standards of length; the Geodetic Survey in 1784, and the General Trigonometrical Survey begun in 1791; expeditions to observe the transits of Venus in 1761, 1769 (commanded by Captain Cook), 1877 and 1882; the Antarctic expeditions of 1772 (under Captain Cook, whose voyage extended to the circumnavigation of the globe), of 1839 (under Ross), and 1900; help with the reports of the British Antarctic Expedition of 1910-13; observations for determining the density of the earth; Arctic expeditions of 1817 (in search of the North-West Passage), of 1819 (under Parry), of 1827 (Parry and Ross), of 1845 (Franklin) of 1874 (under Nares); numerous expeditions for observing eclipses of the sun; 1822, use of coal-tar in vessels of war; best manner of measuring tonnage of ships; 1823, corrosion of copper sheathing by sea-water; Babbage's calculating machine; lightning-conductors for vessels of war; 1825, supervision of gas-works; 1832, tidal observations; 1835, instruments and tables for testing the strength of spirits; magnetic observatories in the colonies; 1862, the great Melbourne telegraph; 1865, pendulum observations in India; 1866, reorganization of the meteorological department; 1866, deep-sea research; 1872, "Challenger" expedition; 1879, prevention of accidents in mines; 1881, pendulum observations; cruise of the "Triton" in Faroe Channel; 1883, borings in delta of Nile; 1884, Bureau des Poids et Mesures; international conference on a prime meridian; 1888, inquiry into lighthouse illuminants; 1890, the investigation of colour-blindness; 1895, examination of the structure of a coral reef by boring; 1896, inquiry into cylinders for compressed gases; the establishment of an International Geodetic Bureau; 1897, determination of the relations between the metric and Imperial units of weights and measures; and, more recently, an inquiry into the volcanic eruptions in the West Indies; international seismological investigation; international exploration of the upper atmosphere; measurement of an arc of the meridian across Africa. During 1913-17 the society completed a magnetic survey of the British Isles. In 1920 it sent two expeditions to observe the total solar eclipse of May 29th, and to note any deflection of rays of light by the sun's gravitational field, as required by Einstein's general theory of relativity. In recent years also the society, acting at the request of the government, has taken the leading part in investigations, in the course of which important discoveries have been made, in relation to various tropical diseases, beginning with the tsetse-fly disease of cattle in Africa, followed by investigations into malaria, Mediterranean fever and sleeping-sickness. In 1924 the society received a bequest of £10,000 for medical research on tropical diseases, etc., and sent an expedition to Kala Asar in North China. The society has also shown an active interest in problems of respiration and circulation in high altitudes (Peru expedition, 1921), and in investigations into glass workers' cataract. The society has standing committees which advise the Indian government on matters connected with scientific inquiry in India and on the observatories of India. The society has taken a leading part in the promotion of the *International Catalogue of Scientific Literature*, and of the International Association of Academies.

In addition to the occasional services enumerated above, the Royal Society has exercised, and still exercises, a variety of important public functions of a more permanent nature. It still provides seven of the board of visitors of the Royal Observatory at Greenwich, has eleven representatives on the Joint Permanent Eclipse committee, and has a Solar Research committee of its own. From 1877 until the reconstitution of the Meteorological Office in 1906 the society nominated the meteorological council, which had the control of that office. The Gassiot and other committees of the society continued to co-operate with the Meteorological Office. Since 1919, when the Meteorological Office was attached to the Air Ministry, the society has two representatives

on the Meteorological Committee. The society has the custody of standard copies of the imperial standard yard and pound. The president and council have the scientific control of the National Physical Laboratory, an institution established in 1899 in pursuance of the recommendations of a treasury committee appointed by H.M. government in response to representations from the Royal Society (the financial control was transferred to the Department of Scientific and Industrial Research in 1918). It also appoints the British delegates to the meetings of the International Research Council.

One of the most important duties which the Royal Society performs on behalf of the government is the administration of the annual grant of £6,000 for the promotion of scientific research. This grant originated in a proposal by Lord John Russell in 1849 that at the close of the year the president and council should point out to the first lord of the treasury a limited number of persons to whom the grant of a reward or of a sum to defray the cost of experiments might be of essential service. This grant of £1,000 afterwards became annual, and was continued until 1876. In that year an additional sum of £4,000 for similar purposes was granted, and the two funds of £1,000 and £4,000 were administered concurrently until 1881, in which year the two were combined in a single annual grant of £4,000 under new regulations. In 1920 the annual grant was increased to £6,000. Since 1896 parliament has also voted annually a grant of £1,000 to be administered by the Royal Society in aid of scientific publications, not only those issued by itself, but also scientific matter published through other channels. This grant was raised to £2,500 in 1925. One of the most useful of the society's publications is the great catalogue of scientific papers—an index now in twelve quarto volumes, under authors' names, of all the memoirs of importance in the chief English and foreign scientific serials from the year 1800 to the year 1883.

A statement of the trust funds administered by the Royal Society will be found in the *Year Book* published annually, and the origin and history of these funds will be found in the *Record of the Royal Society*.

Five medals (the Copley medal, two Royal, the Davy and the Hughes) are awarded by the society every year; the Rumford and the Darwin medals biennially, the Sylvester triennially and the Buchanan quinquennially. The first of these originated in a bequest by Sir Godfrey Copley (1709), and is awarded "to the living author of such philosophical research, either published or communicated to the society, as may appear to the council to be deserving of that honour"; the author may be an Englishman or a foreigner. The Rumford medal originated in a gift from Count Rumford in 1796 of £1,000 3% consols, for the most important discoveries in heat or light made during the preceding two years. The Royal medals were instituted by George IV., and are awarded annually for the two most important contributions to science published in the British dominions not more than ten years nor less than one year before the date of the award. The Davy medal was founded by the will of Mr. John Davy, F.R.S., the brother of Sir Humphry Davy, and is given annually for the most important discovery in chemistry made in Europe or Anglo-America. An enumeration of the awards of each of the medals and the conditions of the awards are published in the *Year Book*.

Under the existing statutes of the Royal Society every candidate for election into the society must be recommended by a certificate in writing signed by six or more Fellows, of whom three at least must sign from personal knowledge. From the candidates so recommended the council annually select fifteen by ballot, and the names so selected are submitted to the society for election by ballot. Princes of the blood, however, and not more than two persons selected by the council on special grounds once in two years, may be elected by a more summary procedure. Foreign members, not exceeding fifty, may be selected by the council from among men of the greatest scientific eminence abroad, and proposed to the society for election.

The anniversary meeting for the election of the council and officers is held on St. Andrew's Day. The council for the ensuing year, out of which are chosen the president, treasurer, principal

secretaries, and foreign secretary, must consist of eleven members of the existing council and ten Fellows who are not members of the existing council. These are nominated by the president and council previously to the anniversary meeting. The session of the society is from November to June; the ordinary meetings are held on Thursdays during the session, at 4.30 P.M. The selection for publication from the papers read before the society is made by the "Committee of Papers," which consists of the members of the council for the time being aided by committees appointed for the purpose. The papers so selected are published either in the Society's *Philosophical Transactions* (4to) or *Proceedings* (8vo).

ROYALTIES. Payment by royalties based on a percentage of the published price has now become the customary method of sharing receipts between publisher and author from sales of a book. The amount of royalty agreed upon depends on the cost (including advertising) and the estimated sale of the book, as well as on the respective bargaining powers of publisher and author. British publishers are accustomed to contracts calling for payment to the author of 10% of the original published price—usually 7/6d.—of a novel by a new author, with provision that the royalty shall rise by agreed-upon stages to 15 or 20%. The successful British author whose sales are already established ordinarily gets a percentage beginning at 15 or 20, and rising to 25 after a sale of from 10,000 to 20,000 at the original price. The royalties on non-fiction books published at higher prices are as a rule somewhat higher than the royalties on novels.

Most British contracts for fiction now contain a provision for publication in cheaper form after the sales at the original published price have ceased. Royalties on these cheap editions range from a farthing a copy on sixpenny editions to 10% on 2/6d. editions.

Another phase of royalties is the advance. When it became apparent that the royalty system was fairer to publisher and author than the old system of payment outright for all rights, the author was prompt to point out that he might starve while waiting for his money—hence the publishers' custom of paying an advance on account of royalties on the day of publication. Authors whose previous sales had been large commanded proportionately large advances.

In the United States, where costs of distribution and advertising are greater than in the British Isles, royalties are lower. Whereas 20% was not uncommon for a successful writer, 15% is now the rule, though 20% after a sale of 10,000 at the original price in America is not unknown, despite the declaration of most of the American publishers that they cannot now go above 15%. The tendency is to begin at 10% of the advertised price, rising to 12½% or 15% after a sale of 5,000 copies at the original price.

When advances are paid to the author before any royalties are earned they are customarily made (a) upon the signing of the agreement, (b) upon delivery of the complete manuscript ready for publication and (c) on the publication date.

It is not the general custom of American publishers to bring out cheap editions of their own novels, though more publishers are bringing out these cheaper editions than ever before. The more usual practice is to sell the cheap edition rights, when possible, to firms who specialize in such editions, the original publisher providing the plates and giving the author half of the royalties, which usually yields to the author a royalty of 5% of the published price of the cheap edition.

As regards royalties on the Continent, it is only within recent years that this system of payment has been generally adopted, and even yet in some of the central European countries and in Holland it is only for particularly important books that royalties

can be obtained. As a rule the percentages are lower than those prevailing in England. In Germany and Austria the royalty is not paid on the retail published price but on the "Broschert," that is to say, on the retail price to the bookseller of the stitched and unbound copy.

A compromise between the percentage royalty on the retail price of every copy sold and the outright payment for the copyright has now been extensively adopted by foreign publishers; the system being the payment of an outright sum for every 1,000 copies printed. The advance on such payment usually covers the number of copies printed in the first edition.

Recent Developments.—The royalty system has undergone a notable change since the beginning of the twentieth century. It was formerly customary for the publisher to contract for the world rights of his author, reselling on a basis of half receipts to himself and half to the author such rights as he could not use—e.g., foreign rights, serial rights, dramatic rights and, at first, moving-picture rights. But such contracts are now rare, the author selling each right separately.

The same tendency is observable in play sales. Here the normal royalty in England and America has become fixed at approximately 5% of the gross weekly receipts up to £500 or \$2,500; 7½% on the next £200 (or \$1,000) and 10% on all gross weekly receipts above £1,000 or \$5,000, with an advance on account of these royalties, payable on the signing of the contract, of from £100 to £200. If the play is sold first in England, the English manager claims a share in the American rights and the film rights—and vice versa if the play is sold in America. If the author is in a strong position he claims and gets a separate royalty in each country for each right, with somewhat lower royalties for translation rights on account of the cost of translation and possibly adaptation. He even reserves the royalties obtainable on his amateur rights, broadcasting rights, and book publication rights.

When moving pictures first presented themselves to the authors as a possible source of suddenly augmented income, an attempt was made to apply the royalty system to payment per foot of film for what soon came to be known as "film rights"; but the difficulties of collection and checking became such that the system has been practically abandoned for outright payment. However, the preference for profit-sharing has brought forth a new form of royalty payment that may presently prevail—i.e., payment on signature of contract of an advance on account of a royalty of usually from 5 to 10% on the "bookings," i.e., the purchases of exhibitors of the rights to show the film for varying periods.

A normal agreement for publication of music is 10% per copy of the retail selling price; half royalty on copies sold for export; half of any broadcasting fees, and half of the moneys received by the publishers as royalties on mechanical reproduction rights. These royalties on mechanical contrivances for the performance of musical works were altered in Great Britain in 1928 by order of the Board of Trade from 5% to 6¼%.

Earlier Systems.—The royalty system became general only in the last century, although before that authors were occasionally paid a stipulated sum for the first impression of a book, and a further sum if a further impression were called for. Samuel Simmonds paid Milton £5 for *Paradise Lost* and agreed to pay a further £5 at the end of the sale of each of the first three impressions. Richard Baxter records that he arranged with Thomas Underhill and Francis Tyton to publish his *Saints' Everlasting Rest*, a quarto of nearly 1,000 pages, for a payment of £10 for the first impression and £20 for every subsequent impression up to 1665.

Sidney Lee records that the highest price known to be paid before 1599 to an author for a play by the manager of an acting company was £11. "A small additional gratuity, rarely exceeding 20s., was bestowed on a dramatist whose piece on its first production was especially well received, and the author was customarily awarded, by way of benefit, a certain proportion of the receipts of the theatre on the production of a play for the second time. The 19 plays which may be set to Shakespeare's credit between 1591 and 1599 combined with such revising work as fell to his lot during those nine years cannot consequently have

successfully urged upon the attention of, the government: the improvement and equipment of the Royal Observatory, Greenwich, in 1710, when it was placed in the sole charge of the society; the change of the calendar in 1752; ventilation of prisons; protection of buildings and ships from lightning; measurement of a degree of latitude; determination of the length of a pendulum vibrating seconds; comparison of the British and French standards of length; the Geodetic Survey in 1784, and the General Trigonometrical Survey begun in 1791; expeditions to observe the transits of Venus in 1761, 1769 (commanded by Captain Cook), 1877, and 1882; the Antarctic expeditions of 1772 (under Captain Cook, whose voyage extended to the circumnavigation of the globe), of 1839 (under Ross), and 1900; help with the reports of the British Antarctic Expedition of 1910-13; observations for determining the density of the earth; Arctic expeditions of 1817 (in search of the North-West Passage), of 1819 (under Parry), of 1827 (Parry and Ross), of 1845 (Franklin) of 1874 (under Nares); numerous expeditions for observing eclipses of the sun; 1822, use of coal-tar in vessels of war; best manner of measuring tonnage of ships; 1823, corrosion of copper sheathing by sea-water; Babbage's calculating machine; lightning-conductors for vessels of war; 1825, supervision of gas-works; 1832, tidal observations; 1835, instruments and tables for testing the strength of spirits; magnetic observatories in the colonies; 1862, the great Melbourne telegraph; 1865, pendulum observations in India; 1866, reorganization of the meteorological department; 1868, deep-sea research; 1872, "Challenger" expedition; 1879, prevention of accidents in mines; 1881, pendulum observations; cruise of the "Triton" in Faroe Channel; 1883, borings in delta of Nile; 1884, Bureau des Poids et Mesures; international conference on a prime meridian; 1888, inquiry into lighthouse illuminants; 1890, the investigation of colour-blindness; 1895, examination of the structure of a coral reef by boring; 1896, inquiry into cylinders for compressed gases; the establishment of an International Geodetic Bureau; 1897, determination of the relations between the metric and imperial units of weights and measures; and, more recently, an inquiry into the volcanic eruptions in the West Indies; international seismological investigation; international exploration of the upper atmosphere; measurement of an arc of the meridian across Africa. During 1913-17 the society completed a magnetic survey of the British Isles. In 1920 it sent two expeditions to observe the total solar eclipse of May 29th, and to note any deflection of rays of light by the sun's gravitational field, as required by Einstein's general theory of relativity. In recent years also the society, acting at the request of the government, has taken the leading part in investigations, in the course of which important discoveries have been made, in relation to various tropical diseases, beginning with the tsetse-fly disease of cattle in Africa, followed by investigations into malaria, Mediterranean fever and sleeping-sickness. In 1924 the society received a bequest of £10,000 for medical research on tropical diseases, etc., and sent an expedition to Kala Azar in North China. The society has also shown an active interest in problems of respiration and circulation in high altitudes (Peru expedition, 1921), and in investigations into glass workers' cataract. The society has standing committees which advise the Indian government on matters connected with scientific inquiry in India and on the observatories of India. The society has taken a leading part in the promotion of the *International Catalogue of Scientific Literature*, and of the International Association of Academies.

In addition to the occasional services enumerated above, the Royal Society has exercised, and still exercises, a variety of important public functions of a more permanent nature. It still provides seven of the board of visitors of the Royal Observatory at Greenwich, has eleven representatives on the Joint Permanent Eclipse committee, and has a Solar Research committee of its own. From 1877 until the reconstitution of the Meteorological Office in 1906 the society nominated the meteorological council, which had the control of that office. The Gassiot and other committees of the society continued to co-operate with the Meteorological Office. Since 1919, when the Meteorological Office was attached to the Air Ministry, the society has two representatives

on the Meteorological Committee. The society has the custody of standard copies of the imperial standard yard and pound. The president and council have the scientific control of the National Physical Laboratory, an institution established in 1899 in pursuance of the recommendations of a treasury committee appointed by H.M. government in response to representations from the Royal Society (the financial control was transferred to the Department of Scientific and Industrial Research in 1918). It also appoints the British delegates to the meetings of the International Research Council.

One of the most important duties which the Royal Society performs on behalf of the government is the administration of the annual grant of £6,000 for the promotion of scientific research. This grant originated in a proposal by Lord John Russell in 1849 that at the close of the year the president and council should point out to the first lord of the treasury a limited number of persons to whom the grant of a reward or of a sum to defray the cost of experiments might be of essential service. This grant of £1,000 afterwards became annual, and was continued until 1876. In that year an additional sum of £4,000 for similar purposes was granted, and the two funds of £1,000 and £4,000 were administered concurrently until 1881, in which year the two were combined in a single annual grant of £4,000 under new regulations. In 1920 the annual grant was increased to £6,000. Since 1896 parliament has also voted annually a grant of £1,000 to be administered by the Royal Society in aid of scientific publications, not only those issued by itself, but also scientific matter published through other channels. This grant was raised to £2,500 in 1925. One of the most useful of the society's publications is the great catalogue of scientific papers—an index now in twelve quarto volumes, under authors' names, of all the memoirs of importance in the chief English and foreign scientific serials from the year 1800 to the year 1883.

A statement of the trust funds administered by the Royal Society will be found in the *Year Book* published annually, and the origin and history of these funds will be found in the *Record of the Royal Society*.

Five medals (the Copley medal, two Royal, the Davy and the Hughes) are awarded by the society every year; the Rumford and the Darwin medals biennially, the Sylvester triennially and the Buchanan quinquennially. The first of these originated in a bequest by Sir Godfrey Copley (1709), and is awarded "to the living author of such philosophical research, either published or communicated to the society, as may appear to the council to be deserving of that honour"; the author may be an Englishman or a foreigner. The Rumford medal originated in a gift from Count Rumford in 1796 of £1,000 3% consols, for the most important discoveries in heat or light made during the preceding two years. The Royal medals were instituted by George IV., and are awarded annually for the two most important contributions to science published in the British dominions not more than ten years nor less than one year before the date of the award. The Davy medal was founded by the will of Mr. John Davy, F.R.S., the brother of Sir Humphry Davy, and is given annually for the most important discovery in chemistry made in Europe or Anglo-America. An enumeration of the awards of each of the medals and the conditions of the awards are published in the *Year Book*.

Under the existing statutes of the Royal Society every candidate for election into the society must be recommended by a certificate in writing signed by six or more Fellows, of whom three at least must sign from personal knowledge. From the candidates so recommended the council annually select fifteen by ballot, and the names so selected are submitted to the society for election by ballot. Princes of the blood, however, and not more than two persons selected by the council on special grounds once in two years, may be elected by a more summary procedure. Foreign members, not exceeding fifty, may be selected by the council from among men of the greatest scientific eminence abroad, and proposed to the society for election.

The anniversary meeting for the election of the council and officers is held on St. Andrew's Day. The council for the ensuing year, out of which are chosen the president, treasurer, principal

secretaries, and foreign secretary, must consist of eleven members of the existing council and ten Fellows who are not members of the existing council. These are nominated by the president and council previously to the anniversary meeting. The session of the society is from November to June; the ordinary meetings are held on Thursdays during the session, at 4.30 P.M. The selection for publication from the papers read before the society is made by the "Committee of Papers," which consists of the members of the council for the time being aided by committees appointed for the purpose. The papers so selected are published either in the Society's *Philosophical Transactions* (4to) or *Proceedings* (8vo).

ROYALTIES. Payment by royalties based on a percentage of the published price has now become the customary method of sharing receipts between publisher and author from sales of a book. The amount of royalty agreed upon depends on the cost (including advertising) and the estimated sale of the book, as well as on the respective bargaining powers of publisher and author. British publishers are accustomed to contracts calling for payment to the author of 10% of the original published price—usually 7/6d.—of a novel by a new author, with provision that the royalty shall rise by agreed-upon stages to 15 or 20%. The successful British author whose sales are already established ordinarily gets a percentage beginning at 15 or 20, and rising to 25 after a sale of from 10,000 to 20,000 at the original price. The royalties on non-fiction books published at higher prices are as a rule somewhat higher than the royalties on novels.

Most British contracts for fiction now contain a provision for publication in cheaper form after the sales at the original published price have ceased. Royalties on these cheap editions range from a farthing a copy on sixpenny editions to 10% on 2/6d. editions.

Another phase of royalties is the advance. When it became apparent that the royalty system was fairer to publisher and author than the old system of payment outright for all rights, the author was prompt to point out that he might starve while waiting for his money—hence the publishers' custom of paying an advance on account of royalties on the day of publication. Authors whose previous sales had been large commanded proportionately large advances.

In the United States, where costs of distribution and advertising are greater than in the British Isles, royalties are lower. Whereas 20% was not uncommon for a successful writer, 15% is now the rule, though 20% after a sale of 10,000 at the original price in America is not unknown, despite the declaration of most of the American publishers that they cannot now go above 15%. The tendency is to begin at 10% of the advertised price, rising to 12½% or 15% after a sale of 5,000 copies at the original price.

When advances are paid to the author before any royalties are earned they are customarily made (a) upon the signing of the agreement, (b) upon delivery of the complete manuscript ready for publication and (c) on the publication date.

It is not the general custom of American publishers to bring out cheap editions of their own novels, though more publishers are bringing out these cheaper editions than ever before. The more usual practice is to sell the cheap edition rights, when possible, to firms who specialize in such editions, the original publisher providing the plates and giving the author half of the royalties, which usually yields to the author a royalty of 5% of the published price of the cheap edition.

As regards royalties on the Continent, it is only within recent years that this system of payment has been generally adopted, and even yet in some of the central European countries and in Holland it is only for particularly important books that royalties

can be obtained. As a rule the percentages are lower than those prevailing in England. In Germany and Austria the royalty is not paid on the retail published price but on the "Broschert," that is to say, on the retail price to the bookseller of the stitched and unbound copy.

A compromise between the percentage royalty on the retail price of every copy sold and the outright payment for the copyright has now been extensively adopted by foreign publishers; the system being the payment of an outright sum for every 1,000 copies printed. The advance on such payment usually covers the number of copies printed in the first edition.

Recent Developments.—The royalty system has undergone a notable change since the beginning of the twentieth century. It was formerly customary for the publisher to contract for the world rights of his author, reselling on a basis of half receipts to himself and half to the author such rights as he could not use—e.g., foreign rights, serial rights, dramatic rights and, at first, moving-picture rights. But such contracts are now rare, the author selling each right separately.

The same tendency is observable in play sales. Here the normal royalty in England and America has become fixed at approximately 5% of the gross weekly receipts up to £500 or \$2,500; 7½% on the next £200 (or \$1,000) and 10% on all gross weekly receipts above £1,000 or \$5,000, with an advance on account of these royalties, payable on the signing of the contract, of from £100 to £200. If the play is sold first in England, the English manager claims a share in the American rights and the film rights—and vice versa if the play is sold in America. If the author is in a strong position he claims and gets a separate royalty in each country for each right, with somewhat lower royalties for translation rights on account of the cost of translation and possibly adaptation. He even reserves the royalties obtainable on his amateur rights, broadcasting rights, and hook publication rights.

When moving pictures first presented themselves to the authors as a possible source of suddenly augmented income, an attempt was made to apply the royalty system to payment per foot of film for what soon came to be known as "film rights"; but the difficulties of collection and checking became such that the system has been practically abandoned for outright payment. However, the preference for profit-sharing has brought forth a new form of royalty payment that may presently prevail—i.e., payment on signature of contract of an advance on account of a royalty of usually from 5 to 10% on the "bookings," i.e., the purchases of exhibitors of the rights to show the film for varying periods.

A normal agreement for publication of music is 10% per copy of the retail selling price; half royalty on copies sold for export; half of any broadcasting fees, and half of the moneys received by the publishers as royalties on mechanical reproduction rights. These royalties on mechanical contrivances for the performance of musical works were altered in Great Britain in 1928 by order of the Board of Trade from 5% to 6¼%.

Earlier Systems.—The royalty system became general only in the last century, although before that authors were occasionally paid a stipulated sum for the first impression of a book, and a further sum if a further impression were called for. Samuel Simmonds paid Milton £5 for *Paradise Lost* and agreed to pay a further £5 at the end of the sale of each of the first three impressions. Richard Baxter records that he arranged with Thomas Underhill and Francis Tyton to publish his *Saints' Everlasting Rest*, a quarto of nearly 1,000 pages, for a payment of £10 for the first impression and £20 for every subsequent impression up to 1665.

Sidney Lee records that the highest price known to be paid before 1599 to an author for a play by the manager of an acting company was £11. "A small additional gratuity, rarely exceeding 20s., was bestowed on a dramatist whose piece on its first production was especially well received, and the author was customarily awarded, by way of benefit, a certain proportion of the receipts of the theatre on the production of a play for the second time. The 19 plays which may be set to Shakespeare's credit between 1591 and 1599 combined with such revising work as fell to his lot during those nine years cannot consequently have

brought him less than £200 or some £20 a year. Between 1599 and 1611 his remuneration as both actor and dramatist was on the upward grade. The fees paid dramatists rose rapidly. The exceptional popularity of Shakespeare's work after 1599 gave him the full advantage of the higher rates of pecuniary reward in all directions. The 17 plays that were produced by him between that time and the close of his professional career could not have brought him less on an average than £25 each, or some £400 in all." But the pound of that day had over five times its present value. Later on prices improved and Fielding, for example, received £1,000 from Andrew Miller for *Amelia*, while Gibbon received two-thirds of the proceeds on his history.

Edward Chapman, of Chapman and Hall, in a letter to Forster (1837) said: "There was no agreement about *Pickwick* except a verbal one. Each number was to consist of a sheet and a half, for which we were to pay 15 guineas, and we paid him for the first two numbers at once, as he required the money to go and get married with. We were also to pay more according to the sale, and I think *Pickwick* cost us altogether £3,000." Forster adds: "I had always pressed so strongly the importance to him of some share in the copyright that this at last was conceded in the deed above mentioned (though five years were to elapse before the rights should accrue) and it was only yielded as part consideration for a further agreement entered into on the same date (Nov. 19, 1837) whereby Dickens engaged to write a new work (*Nickelby*) the first number of which was to be delivered on the 15th of the following March and each of the numbers on the same day of each of the successive 10 months, which was also to be the date of the payment to him by Chapman and Hall, and 20 several sums of £150 each for five years' use of the copyright, the entire ownership in which was then to revert to Dickens."

On July 2, 1840, Dickens wrote to Chapman and Hall: "Your purchase of *Barnaby Rudge* is made upon the following terms. It is to consist of matter sufficient for ten monthly numbers of the size of *Pickwick* and *Nickelby*, which you are, however, at liberty to divide and publish in 15 smaller numbers if you think fit. The terms for the purchase of this edition in numbers and for the copyright of the whole book for six months after the publication of the last number are £3,000. At the expiration of six months, the whole copyright reverts to me." (C. Bn.)

See Copinger's *Law of Copyright* (6th ed., 1927); Michael Joseph, *The Commercial Side of Literature* (1925); Stanley Unwin, *The Truth about Publishing* (1926).

ROYALTIES, IN MINING. In some countries (e.g. France) minerals are owned by the State which may grant concessions to private individuals or corporations. In others (e.g. the United States) they belong to the landowner.

Until the coming into force of the Coal Mines Act of 1938 all minerals in Great Britain—apart from special customs and excepting mines of gold and silver, which are the property of the Crown (i.e. "Royal") metals, hence the term "royalty"—were privately owned. But under the Coal Mines Act alluded to the coal and associated mineral substances (fireclays, stratified ironstone) pass to the State under a system of compulsory purchase, the total amount of the compensation payable being £66,450,000. A Central Valuation Board was appointed in Sept. 1938 to divide this amount as between the coal "regions" in accordance with the terms of the Act, which specified that the amount allocated to each "valuation region" should bear the same proportion to the global figure as the value of all the principal coal hereditaments in the said region bears to the value of all such hereditaments in Great Britain.

The valuation of the individual ownerships, region by region, commenced in Jan. 1, 1939, the date determined by the Act, from which date the coal is held as if all existing owners had entered into a contract for the sale of the coal to the Coal Commission (a body set up by Parliament to control the nationalized coal property, and clothed with certain other powers), the contract being completed on the "vesting date", July 1, 1942.

Presumably the transfer of the ownership of the coal and allied minerals will not materially affect the terms upon which it is leased to the colliery proprietors. These terms are such as include

the right to work the coal on the payment of a "fixed," "certain" or "dead" rent per annum, which merges in the royalty rent. When in any year the tonnage worked at this rent exceeds in royalty value the certain rent, the surplus is paid as "overworkings"; when it falls short, the deficiency is carried forward as "short workings" to the next year's account.

The royalty rent is payable either (1) as a tonnage rate pure and simple, (2) a sum per acre per foot thick of coal in the seam, (3) simply a sum per acre as a proportion of the value of the mineral raised, or (4) by way of a sliding scale. The first two are the methods most commonly adopted. The average royalty per ton inclusive of way-leave (i.e. the right of passage through another's land—surface or underground) of all coal raised in Great Britain, is usually taken at 53d. per ton. The total gross revenue derivable from ownership of coal (royalties and way-leaves) was, in 1918, £5,960,365. The average taken by government for purposes of compensation under the Act was £4,430,000, being the average for the years 1928–34 inclusive. In the case of metalliferous ores, both in Great Britain and in other countries, the royalty is assessed as a proportion of the "dressed" ore (i.e. as ready for smelting): e.g. 1/20th to 1/30th. Clay china, gneiss, and other "clays," oil shale, slate, building stone, and stratified ironstone are also subject to royalty.

In the United States the royalty payable on coal is usually based upon a fixed rate per ton, which in the case of bituminous coal would be a uniform rate for all coal sold; but in the case of anthracite the rate per ton frequently varies with the size, a higher royalty being paid upon larger sizes; and, in some instances, the royalty is a sliding scale varying with the sale price. Royalties vary from a few cents per ton in the case of bituminous, to as much as \$1.00 per ton for the highest grades and largest sizes of anthracite.

Natural petroleum does not occur in commercial quantity in Great Britain, but in the United States, where it is produced in vast quantities, oil lands are usually leased on a royalty basis, the royalty being paid to the owner of the land on a percentage of the oil produced. In the case of natural gas, royalties are rarely paid on a percentage basis, but usually as a stipulated amount for the right to pipe and sell the gas.

In Canada the royalty is 10% of the crude oil; in British India 5%; France and Algeria 20%; Rumania from 8% when the output per well per day averages 10 metric tons up to 35% when it exceeds 150 metric tons, payable to the State which allows 20% of the receipts to the surface owner; in Colombia and Peru, from 10 to 6 per cent; in Argentina and Venezuela, 10 per cent. Crude oil for royalty purposes usually means crude oil after deduction of water, foreign substances, and oil consumed in production.

See J. H. Cockburn, *The Law of Coal and Minerals* (1902); R. A. S. Redmayne and G. Stone, *The Ownership and Valuation of Mineral Property* (1920); E. R. Wiley, *The Oil Industry* (1926). (R. R.)

ROYAN, a town of W. France, in the department of Charente-Inférieure, on the right bank of the Gironde at its mouth 63 mi. below and N.N.W. of Bordeaux. Pop. (1936) 10,193. It belonged to the family of Trémouille, in whose favour it was made first a marquessate and then a duchy. During the first half of the 15th century it was held by the English. During the wars of religion it was the centre of Calvinism and in 1622 was besieged by Louis XIII. At the end of the 18th century it had about 1,000 inhabitants and was noticeable only for its priory. Its prosperity dates from the Restoration, when steamboat communication was established with Bordeaux.

ROYCE, JOSIAH (1855–1916), American philosopher and teacher, was born at Grass Valley, a California mining town, on Nov. 20, 1855. At 16 he entered the newly-opened University of California, inclined to the study of engineering. But the teaching of Joseph LeConte, the geologist, and of Edward Rowland Sill, the poet, raised his extraordinary speculative power; and on receiving his baccalaureate degree, 1875, he gave himself to the study of philosophy, first in Leipzig and Göttingen (under Lotze) and then, as one of the first fellows of Johns Hopkins university, with William James and Charles Peirce. Here he received the degree of Ph.D., 1878. After teaching English for four years in

the University of California he was called to Harvard university as lecturer in philosophy, becoming assistant professor in 1885, professor in 1892 and succeeding George Herbert Palmer as Alford professor in 1914. He received various honorary degrees and was made in 1916 Honorary Fellow of the British Academy. He died at Cambridge, Mass., Sept. 14, 1916.

His effect as teacher and writer was profound: no previous American thinker had so united moral energy with wide historical learning, command of scientific method and intense interest in logical technique. His versatile mind concerned itself effectively with a wide range of subjects; he contributed to mathematical logic, psychology, social ethics, literary criticism and history as well as to metaphysics. His thought was massive and intimately human; yet it was sustained with a dialectical skill of such evident virtuosity as, on the one hand, to excite the critical opposition first of pragmatic and then of realistic schools, and, on the other hand, to set a new standard in the systematic treatment of philosophy. In this latter respect, Royce did for American philosophy what his older contemporary, F. H. Bradley, did for British philosophy: in many ways the views of these thinkers are akin. Like Bradley, Royce teaches a monistic idealism. Scientific laws he describes—anticipating certain developments of recent physics—as statistical formulae of average behaviour. His absolute idealism is supplemented, not corrected, by the ethical and social teachings of his later years and, in particular, by the conception of the world of human selves as the Great Community, the literally personal object of moral loyalty.

BIBLIOGRAPHY.—Among his more important publications (selected from a far greater number) are: *The Religious Aspect of Philosophy* (1885); *The Spirit of Modern Philosophy* (1895); *The Conception of God* (1895), with Supplementary Essay (1897); *Studies of Good and Evil* (1898); *The World and the Individual* (Gifford Lectures), vols. I, II, (1900–01); *The Conception of Immortality* (1900); *Outlines of Psychology* (1908); "The Relation of the Principles of Logic to the Foundations of Geometry," in *Transactions of the American Mathematical Soc.*, vi, 3 (1905); *The Philosophy of Loyalty* (1908); *The Sources of Religious Insight* (1912); "Eristic Logic," *Encyclopædie der Philosophischen Wissenschaften*, Bd. I, (1912), English translation in *Encyclopaedia of the Philosophical Sciences*, vol. I, (1913); *The Problem of Christianity* (lectures delivered at the Lowell Institute, Boston, and at Manchester college, Oxford), vols. I, II, (1913); "The Mechanical, the Historical and the Statistical," *Science*, n.s. xxxix, (1914); *Lectures on Modern Idealism* (1919). ROYDEN, AGNES MAUDE (1876–), British social worker and preacher, youngest daughter of Sir Thomas Royden, 1st bart of Frankly hall, Cheshire. Until 1914 she edited *The Common Cause*, the organ of the National Union of Women's Suffrage societies. She was assistant preacher at the City temple, London, from 1917 until 1920, when she founded, with Percy Dearmer, the Fellowship societies at Kensington, later transferred to Great Ormond street, London. She was created C.H. in 1930.

Her numerous books and pamphlets include *Women and the Sovereign State* (1917); *Sex and Common-sense* (1922; rev. ed. 1947); *Prayer as a Force* (1922), *Political Christianity* (1922); *The Church and Woman* (1924); *Here—and Hereafter* (1934); and *A Threefold Cord* (1947).

ROYER-COLLARD, PIERRE PAUL (1763–1845), French statesman and philosopher, was born on June 21, 1763, at Sompuis, near Vitry le Français (Marne), the son of Antoine Royer, a small proprietor. He was sent to the college of Chaumont of which his uncle, Father Paul Collard, was director. He followed his uncle to Saint-Omer, where he studied mathematics. At the outbreak of the Revolution he was practising at the Parisian bar. He was returned by the Island of Saint Louis to the Commune, of which he was secretary from 1790 to 1792. After the revolution of Aug. 10, 1792, he was replaced by J. L. Tallien. His sympathies were now with the Gironde, and after the insurrection of the 12th Prairial (May 31, 1793) he was in danger of his life.

He returned to Sompuis, and was saved from arrest possibly by the protection of Danton. In 1797 he was returned by his department (Marne) to the Council of the Five Hundred. He made one great speech in the council in defence of the principles of religious liberty, but retired into private life at the *coup d'état* of

Fructidor (Sept. 4, 1797).

From that time until the Restoration Royer-Collard devoted himself to the study of philosophy. His opposition to the philosophy of Condillac arose from the study of Descartes and his followers, and from his early veneration for the fathers of Port-Royal. He desired to establish a system which should provide a moral and political education consonant with his view of the needs of France. From 1811 to 1814 he lectured at the Sorbonne. Royer-Collard was the moving spirit of the "Doctrinaires" led by Guizot, P. F. H. Serre, Camille Jordan and Charles de Rémusat, who met at the house of the comte de Ste. Aulaire and in the salon of the duchesse de Broglie. In 1820 Royer-Collard was excluded from the council of State by a decree signed by his former ally Serre. In 1827 he was again elected; in 1828 he became president of the chamber, and fought against the reactionary policy which precipitated the Revolution of July. In March 1830 he presented the address of the 221. From that time he took no active part in politics, although he retained his seat in the chamber until 1839.

He died at his estate of Châteauneuf, near Vitry, on Sept. 2, 1845. He had been a member of the Academy since 1827.

Fragments of Royer-Collard's philosophical work are included in Jouffroy's translation of the works of Thomas Reid. The standard life of Royer-Collard is by his friend Prosper de Barante, *Le politique de M. Royer Collard, ses discours et ses écrits* (3 vols., 1861). There are also biographies by M. A. Philippe (1857), L. Vingtain (1858), E. Spuller (1895), in *Grands écrivains français*. See E. Fauguet, *Politique et morale du dix-neuvième siècle* (1891); H. Taine, *Les Philosophes français du dix-neuvième siècle* (1857); L. Stéché, *Les Derniers Jansénistes* (1891); and Lady Blennerhassett, "The Doctrinaires" in the *Cambridge Modern History* (vol. x, chap. ii, 1907).

ROYSTON, a market town and urban district in Hertfordshire, England, near the border of Cambridgeshire, 48 mi. N. of London. Pop. (1951) 4,663. Area, 2.5 sq.mi.

The town lies on the Roman Ermine street. Roman relics have been found, and several barrows and earth-mounds occur on the neighbouring hills. A monastery of Augustinian canons was founded here about 1180. The church of St. John the Baptist is mainly Early English.

ROYTON, urban district, Lancashire, England, on L.M.S.R. Pop. (1951) 14,772. Area, 3.4 sq.mi. It lies next to Oldham and owes its rise to the cotton manufacture.

ROZAS, JUAN MARTINEZ DE (1759–1813), the earliest leader in the Chilean struggle for independence, was born at Mendoza in 1759. In early life he was a professor of law, and of theology and philosophy at Santiago.

He was acting governor of Concepción at one time, and was also colonel in a militia regiment. In 1808 he became secretary to the last Spanish governor, Francisco Antonio Carrasco, and used his position to prepare the nationalist movement that began in 1809. After resigning as secretary, Rozas was mainly responsible for the resignation of the Spanish governor, and the formation of a national Junta on Sept. 18, 1810, of which he was the real leader. Under his influence many reforms were initiated, freedom of trade was established, an army was organized and a national congress was called in July 1811. Rozas died at Mendoza March 3, 1813.

RUANDA-URUNDI, United Nations trust territory in East Africa, administered by Belgium. It lies between 1° and 4° S. latitude and 29° to 31° E. longitude and is bound on the north by Uganda, on the east and south by Tanganyika territory (boundary adjusted by treaty, Nov. 22, 1934), on the west by the Belgian Congo. Area, 20,115 sq.mi. Pop. (1950) 3,904,779, including 3,733 Europeans (2,605 Belgians) and 1,866 Asiatics.

After World War I Belgium assumed administration under a mandate of the League of Nations, which was formally accepted by the Belgian parliament on Oct. 20, 1924, after concurrence of the United States had been secured by treaty, April 18, 1923. It had previously been a portion of German East Africa.

In Dec. 1946 the United Nations placed it under U.N. trusteeship. Under the law of Aug. 21, 1925, Ruanda-Urundi was organized as an integral part of the Belgian Congo but with a separate budget. A vice-governor general, under the direction of the governor general of the Belgian Congo, was named the administrator.

The residency of Ruanda is comprised of the territories of Kigali, Nyanza, Astrida, Shangugu, Kisenyi, Ruhengeri, Byumba and Kibungu; the residency of Urundi is comprised of Kitega, Muramvya, Ngodi, Muhinga, Ruyigi, Rutana, Bururi, Usumbura and Bubanza.

The greater part of the country is mountainous and lies at a high altitude. The bulk of the people are of Bantu stock, but the higher caste, about one-tenth of the total population, are of the pastoral Wahima race, as in Uganda, Bunyoro and Ankole. The wealth of the country consists in its flocks and herds.

Early in 1928 there was a revolt against Musunga, the king of Ruanda. The movement was also antiwhite and spread across the border into the southwest corner of Uganda. Belgian and British forces restored order.

As a result of its distance from the sea and the lack of cheap transport, the trade of the country developed slowly.

In 1930 the value of exports was 1,082,970,340 fr. and the value of imports 1,174,854,788 fr. Roads totalled 4,803 mi., including 216 mi of principal roads. There were no railways.

BIBLIOGRAPHY.—*Rapports sur L'Administration Belge du Ruanda-Urundi* (annual); R. De Rouck, *Atlas géographique et historique du Congo Belge et des territoires sous mandat du Ruanda-Urundi* (1928). (P. W. L.; X.)

RUBBER: BOTANY, CULTIVATION AND CHEMISTRY. During his second visit to South America, Columbus was astonished to see the native Indians amusing themselves with a black, heavy ball made from a vegetable gum. Later explorers were equally impressed by these balls, and an historian of the time remarked that they rebounded so much that they appeared alive. Three centuries elapsed before the material was brought into commercial use in Europe, and it was then marketed not for

tions of powders and plastic solids.

Although raw rubber is a coherent, elastic solid, it is obtained from a milky liquid known as *latex*, which occurs in special tubes in the roots, stem, branches, leaves and fruit of a wide variety of trees growing for the most part in the tropics. Rubber latex consists of a watery solution (serum), in which float small globules of rubber visible under a microscope. Although neither the rubber nor the serum is definitely opaque in thin layers, the many reflecting surfaces presented by these globules cause the latex to have the appearance of cows' milk, but whereas cows' milk contains only about 1% solid matter, rubber milk contains 30-40%. When rubber milk is suitably treated the globules unite (coagulate) and float in the serum as a soft, doughy mass (coagulum), which can be easily rolled to a sheet or other convenient form. On drying the coagulum loses its doughy character and becomes the firm, elastic solid known as raw or crude rubber.

Sources of Supply.—The numerous varieties of trees which contain rubber latex belong to many different botanical families, but nearly the whole of the world's rubber supply is obtained from a tree known as *Hevea brasiliensis* belonging to the family Euphorbiaceae. The rubber obtained from the latex of this tree usually contains over 90% caoutchouc of excellent quality. Few other trees furnish rubber of a purity and quality approaching this. In some cases the latex yields a product which consists chiefly of resin. Jelutong rubber, for example, obtained from *Dyera costulata*, a large tree growing in the East Indies, is very resinous, as also is the rubber produced from shrubby species of *Euphorbia* indigenous to South Africa.

Certain tropical African plants yield rubber of good quality, but the methods of preparation employed by the natives are crude and tend to degrade the product. The most important are *Funtumia elastica*, a tall and stately tree, and various species of *Landolphia*, which are big woody climbers.

A tree which is well known because it is cultivated in Europe as an ornamental plant under the name of the indiarubber tree is *Ficus elastica*, indigenous to Assam and Burma, where it grows to a considerable size. It yields moderately resinous rubber.

Guayule rubber from *Parthenium argentatum*—a silvery-leaved shrub found in north Mexico and is also moderately resinous.

The tropical American rubbers include Ceara rubber from *Manihot Glaziovii*, a tree of moderate size growing in Brazil, and Caucho rubber from *Castilloa elastica*, a large tree found in Central America and portions of Brazil. In both cases the rubber is of fairly good quality. The purest and best, however, is undoubtedly the Para rubber obtained chiefly from *Hevea brasiliensis* and to a lesser extent from *Hevea Benthamiana*. Both these trees are found in the Amazon valley, the former around the southern and the latter around the northern tributaries. *Hevea Benthamiana* is not so widely distributed as *Hevea brasiliensis*, but both yield rubber which is classed as "hard fine para"—the highest grade on the market.

Origin of Plantations.—In spite of huge natural resources the demand for Para rubber is far in excess of the quantity which the Amazon can supply. At one time there was no other source of *Hevea* rubber, but as long ago as 1834 Thomas Hancock, the English discoverer of vulcanisation and a rubber manufacturer, called attention to the high price of rubber and the possibility of growing it in the East. The requisite climate conditions appeared to be a heavy, well-distributed rainfall (about 100 in. per annum) and a temperature of 70°-90° F. These conditions are obtained over wide areas in the East. Eventually Sir Joseph Hooker, Director of the Royal Botanical Gardens, Kew, London, interested himself in the problem, and in 1873 2,000 *Hevea* seeds from the Amazon were delivered to Kew by a Mr. Farris. Only a dozen germinated, and six sent to the Royal Botanical Gardens, Calcutta, did not thrive. Arrangements were then made for further supplies of seeds. The most successful collector was H. A. Wickham (now Sir Henry Wickham) who displayed much enterprise and care in successfully bringing to Kew a consignment of 70,000 seeds of *Hevea brasiliensis*. Hot houses were summarily emptied, and within two weeks of the arrival of

its elastic properties but to rub out lead pencil marks—hence the name indiarubber or rubber. Since then the principal constituent (caoutchouc) of this material has been found as a vegetable product in many parts of the world, sometimes mixed with as little as one twentieth and sometimes with eight times its own weight of other substances. Some of these mixtures are strong and elastic, others are weak and brittle, but they are all classified as rubber. In addition, the term has been broadened by common use to include a wide range of vulcanised products derived from rubber by heating with sulphur, generally after mixing with large propor-

the seeds in England there were over 2,000 young plants, nearly all of which were despatched to Ceylon, where they proved very successful.

After the establishment of *Hevea* trees in Ceylon steps were taken to distribute plants and seeds to other countries. Difficulties were experienced in exporting seeds in a sound condition, and the problem was studied by H. N. Ridley in the Botanical Gardens at Singapore. He found that seeds packed in moist, powdered charcoal retained their fertility for a long time, and when shortly after the beginning of the twentieth century planters began to take an increasing interest in rubber, large quantities of seeds were distributed by this means from Malaya.

The countries producing the largest quantities of plantation rubber are Malaya, the Dutch East Indies, and Ceylon. Smaller amounts are also obtained from India, Sarawak, Borneo, French Indo-China, Siam and various parts of Africa. Owing chiefly to the demands of the motor car industry the production of plantation rubber has made phenomenal progress. The first occasion on which a considerable amount of plantation rubber was offered on the market was in 1910, when the output reached 11,000 tons. By 1920 it was nearly 317,000 tons and in 1927 it amounted to 567,000 tons. In this period there were wide fluctuations in price, ranging from 12s. od. per lb. in 1910 to 7½d. per lb. in 1921.

While the production of plantation rubber has continued to increase that of wild rubber has decreased until in 1927 the world's production of all grades of wild rubber was only 6% of that produced on plantations. The reason for this is that not only is plantation rubber of good quality, comparable with that from the Amazon, but it is put on the market in a clean, dry condition.

Description of Principal Rubber Tree.—*Hevea brasiliensis* is a large tree which on occasions grows to a height of over 100 ft. with a well developed trunk more than 12 ft. in circumference. The usual height on plantations is from 60 to 80 ft. The leaves are three-lobed, the segments being long and narrow and tapering at each end. The flowers are usually pale green and inconspicuous, separate male and female flowers being borne on the same tree. The fruit is a capsule containing three seeds which are oval and have a mottled brown, smooth coat. When ripe the

bark. Next to the cambium and in the soft portion of the bark are found the latex tubes. Outside the soft bark is a hard portion where there are comparatively few latex tubes. The whole is protected by an external layer of cork. The diameter of the latex tubes is considered to be about 0.0015 inch.

Cultivation.—*Hevea brasiliensis* is planted on many types of soil and thrives remarkably well as long as exposed precautions are taken to avoid swampy, undrained or exposed lands. It is sometimes grown at an altitude of over 2,000 ft., but the trees do not flourish so well at this altitude as at a lower level.

In opening up a new plantation the land is cleared of all growth as soon as possible not only to make room for the rubber trees but also to avoid the possibility of disease from rotting timber.

At one time it was the practice on rubber plantations to remove all weeds and leave bare the ground between the trees, but this is no longer regarded as an attribute of a well-kept estate. It is still the practice to remove the weeds, but heavy tropical rains have caused such loss of top-soil, particularly on sloping land, that many estates find it necessary to plant cover crops. Shrubby types of plants such as species of *Crotalaria* and *Tephrosia* which are periodically lopped and mulched into the soil, or herbaceous types such as *Cenrosema pubescens* and *Vigna oligosperma* are among those used.

On sloping land cover crops are not sufficient to prevent the loss of valuable top-soil. In Ceylon for example stone walls are sometimes built across the hills. As a general rule however it is considered better to level the land in a series of contours about 15 to 20 ft. apart, cutting into the side of the hill at a slight gradient to a depth of about six feet.

The loss of top-soil can also be reduced by drains which prevent the accumulation of a continuous stream of water during heavy rain. In Ceylon a series of lateral drains empty into main drains (herring-bone drains) which carry the water away, but in Malaya and Sumatra the water is trapped in blind drains (silt pits) from which it ultimately percolates into the soil.

Where considerable erosion has taken place or the soil has been impoverished by previous cultivation it is sometimes possible to effect great improvement in the health of the trees by the addition of manures, particularly those containing nitrogen and phosphorus. This increased health is reflected in a more vigorous canopy of leaves, better replacement of bark removed for collection of latex, and a greater yield of latex.

The number of trees planted per acre on estates is largely dictated by local conditions, such as the quality of the soil and the contour of the land. Most estates plant out more trees than will eventually be required and thin them out, removing weak ones or those which prove low yielders, leaving about 90 trees per acre.

The rubber tree is by no means free from disease but a careful watch is kept by scientific officers, and nowhere in the East have the diseases assumed serious proportions. The most troublesome are an abnormal leaf-fall (not to be confused with that which occurs while the trees are wintering) and a pathological condition of the bark often associated with heavy tapping. Measures have been devised to counteract both, but they still occur.

Selection of Planting Material.—Most trees on estates yield 4 to 5 lb. of rubber per annum, but there are a few which yield as much as 30 lb. growing by the side of others which yield only 2 lb. As yield capacity is partly hereditary, it seems probable that the yield per acre may be greatly increased by propagating from high-yielding trees only. For this purpose two methods of propagation have received considerable attention. In one the plants are raised from seeds from carefully selected high yielding mother-trees. In the other a bud from a high yielding mother-tree is grafted on to a vigorous young plant grown from seed. Unless special care is taken a high yielding mother tree is liable to be fertilised by pollen from neighbouring low yielders, so that the daughter trees grown from seed may not be particularly good yielders. On the other hand it is to be expected that the budded material will have the vegetative characteristics of the mother tree.

Tapping.—The trees are ready for tapping for latex when about five years old, but the yield of latex and the quality of rubber obtained are not so good as when the trees are a few years

FIG. 2.—*CASTILLEJA ELASTICA*
(A) Sprig bearing male flowers, (B) a seed, (C) a leaf, (D) twig bearing female flowers

capsules explode violently and eject the seeds to a distance of 20 yd. or more, well beyond the shadow cast by the parent tree.

The structure of what is popularly known as the bark is of considerable importance in *Hevea brasiliensis*, because, as already indicated, the latex vessels in this part of the tree are the chief source of the world's rubber supply. The trunk of a tree may be divided roughly into an inner portion of wood and an outer portion of bark. At the junction of the bark and the wood is a layer of cells about the thickness of a sheet of paper, known as the cambium, which appears as a slimy layer when the bark is torn away from the tree. This layer is the seat of growth, on the one hand adding new cells to the wood and on the other new cells to

older. Tapping is a very delicate and important operation, consisting in the removal of a shaving of bark with a sharp knife. The cut passes through the latex tubes and there is a flow of latex in consequence. If the cut is too deep, it penetrates into the cambium and bark renewal is hindered, but if it is not deep enough only a portion of the latex tubes are pierced and the yield of latex is reduced. For perfect tapping it is necessary to cut within $\frac{1}{8}$ in. of the wood, an operation requiring practice and skill.

The only tapping tools in general use on the plantations are a gouge (straight or bent) and the ordinary farrier's knife (or its modification).

It is the usual practice to make the first cut at between two and four feet from the ground. A shaving is then taken at definite intervals of time from the lower edge of the exposed bark. The thickness of the shaving removed is so arranged that the consumption of bark is between half an inch and one inch per month, some districts, such as Ceylon, preferring thin shavings while others, such as Malaya, prefer thicker shavings.

The length of the shaving varies from one-half to one-quarter of the circumference, some estates employing a single spiral cut at an angle of about 30° to the horizontal and some a V cut. In Ceylon it is the practice to change the tapping panel every six or twelve

tapping operations are always carried out in the early morning when the flow of latex is greatest. The latex from each tree is collected in a cup, transferred to a pail and taken to the factory as quickly as possible. Sometimes sodium sulphite is added to prevent premature coagulation. When the latex has ceased to drip there remains on the bark a thin film which dries in the sun leaving a strip of rubber. This is collected, washed in the factory and sold as "tree scrap"—an inferior grade.

Preparation.—The details of the methods employed in the preparation of plantation rubber depend upon the shape and appearance of the product to be put on the market, but in nearly all cases the outlines of the procedure adopted are the same. The sieved and diluted latex containing 15–25% rubber is treated with a coagulant such as acetic or formic acid or sodium silicofluoride. This causes the rubber to rise to the surface as a wet, white, doughy coagulum leaving in solution a small quantity of mineral and organic matter. The coagulum is then pressed between rollers until it is the required consistency, thickness and shape. After that it is hung to dry and eventually packed in wooden cases and shipped to its destination.

The two most important forms of plantation rubber are sheet and crêpe. Sheet is generally dark brown in colour because it is dried in smoke, whilst crêpe is a straw colour and is dried in air.

Sheet is obtained from latex coagulated in shallow tanks divided into compartments of suitable dimensions, each piece of coagulum being pressed by light machinery to the required thickness.

In the preparation of crêpe the coagulum is machined much more drastically, heavy rollers being necessary. During this process the coagulum is torn and pressed until it is sufficiently thin to dry in air without artificial heat. The rubber is dried by hanging on racks in well ventilated sheds for about a week.

Sheet is thicker than crêpe and requires artificial heat to dry it in a reasonable time. It is therefore exposed to the smoke of a wood fire for about 14 days. It was at one time presumed that smoking had a beneficial effect on quality because the highest grade rubber was obtained from the Amazon where the latex is coagulated with smoke, a wooden paddle being repeatedly dipped into the latex and exposed to the smoke of burning Urucuri nuts until a fairly large sized ball of rubber is built up. Experimental evidence does not support this view however and it is probable that as firewood becomes more difficult to obtain other means of drying sheet rubber will be developed on estates.

Both crêpe and sheet are sold largely on appearance. It is customary therefore to add sodium bisulphite to latex when preparing crêpe so that the rubber may be as pale as possible, and p-nitrophenol to latex in the preparation of sheet so that the development of mould may be prevented. Sheet rubber contains more mechanically enclosed serum substances than crêpe and is therefore a more suitable medium for the growth of mould. Not even drying in smoke entirely prevents this when conditions are favourable, but p-nitrophenol is an effective safeguard.

A considerable proportion of plantation rubber is prepared on native estates without machinery of any kind. In these cases the latex is coagulated with a convenient coagulant, not necessarily a suitable one. Sulphuric acid and alum have been used for this purpose although they affect adversely the behaviour of the rubber during manufacturing processes. The coagulum is lightly pressed by hand and whilst still wet is sent to a central factory where it is milled to crêpe and sold as an inferior grade of rubber.

Chemistry.—The microscope has been particularly useful in yielding information concerning the structure of rubber latex. The array of globules dancing here and there (Brownian movement) are easily seen at moderate magnifications, and it is possible to measure them and show that they vary in shape and size. In Hevea latex the globules are shaped like a pear and vary in length from 0.0003 in. to six times that size. In spite of their minute size the expert has been able to ascertain that the globules in Hevea latex consist of an outer skin of non-rubber material, enclosing a viscous rubber shell surrounding semifluid rubber.

When Hevea latex is treated with any but very weak acids, the Brownian movement of the globules ceases, and they unite to form a coherent coagulum. Dehydrating agents such as alcohol and pro-

months, but elsewhere it is customary to continue tapping on one panel down to the ground before commencing a fresh panel. Tapping is generally carried out every alternate day, one portion of an estate being rested while the other is tapped.

After the bark has been cut away, it is regenerated complete with latex vessels in a few years. With the most conservative system it is eventually necessary to tap on renewed bark. As the replacement of bark becomes more difficult each time a panel is tapped, there is a limit to the economic life of the tree, but the industry is too young for definite information on this point.

tein precipitants such as tannic acid also cause *Hevea* latex to coagulate.

In the presence of suitable proportions of an alkali such as ammonia or caustic soda, *Hevea* latex retains its liquid condition for many years, but in the absence of such additions bacterial action occurs, acids are developed and the latex quickly coagulates. Disinfectants also have a preserving effect on latex.

As already indicated, undiluted *Hevea* latex usually contains 30-40% of rubber. There are also present a number of other substances, amongst which by a remarkable chance are small quantities of compounds essential to the commercial applications of the product. When latex is coagulated with an acid only a portion of the accessory substances are coagulated with the rubber. The rest remains in the serum. The active non-rubber substances still mixed with the rubber are ample, however, to satisfy commercial requirements. For this reason methods of preparing rubber by evaporating latex have not met with general approval. In such cases the pure rubber may only amount to 85% of the solid material, whereas commercial crepe and sheet prepared by acid coagulation may contain as much as 95%.

The following table shows the average percentage of the different non-rubber substances in dried *Hevea* latex in comparison with the amounts present in crepe and sheet.

Non-rubber constituent	Amount present in	
	Dried latex per cent	Crepe and Sheet per cent
Protein and nitrogenous matter	4-5	2
Constituents soluble in acetone	4-5	3
Mineral matter (ash)	1-2	0-3
l-methyl inositol	1-2	traces
Sugars	2	traces

Some of the constituents of the accessory substances are particularly active in accelerating vulcanisations and are therefore of great importance to the rubber manufacturer. A similar effect may also be produced by another of the accessory substances, viz., the ash which consists chiefly of potassium compounds.

Constituents soluble in acetone (a solvent which does not affect the rubber portion of the product) contain an appreciable amount of fatty acids such as oleic and stearic which dissolve and disperse some of the mineral powders mixed with rubber during commercial operations. The acetone-soluble material also contains a substance (allied in chemical composition to the sterols) which is particularly useful in preserving vulcanized rubber goods against the effects of atmospheric oxidation, so that they remain supple and elastic for a longer period than they otherwise would.

Pure rubber (caoutchouc) is a compound containing carbon and hydrogen only, in the proportion corresponding to five atoms of carbon and eight of hydrogen (C_5H_8). It belongs to the class of bodies known as terpenes and is related in chemical composition to the constituents of turpentine.

The specific gravity of rubber is a little less than that of water. It decreases regularly with increase of temperature except between 30 and 35° C when the decrease is greatly accelerated. At the temperature of liquid air rubber is transparent and brittle like glass. At 0-10° C it is hard and opaque, but quickly reverts to a soft and translucent condition above 20° C. As the temperature increases the rubber becomes softer, stickier, weaker and less elastic. These changes are greatly accelerated at temperatures of 50-60° C. At a little below 200° C rubber decomposes yielding liquid hydrocarbons of the terpene series.

When rubber is repeatedly pressed between rollers it becomes more plastic and sticky and less elastic. While in this condition large quantities of powders and plastic solids may be mixed with the rubber merely by repeatedly passing through rollers.

Rubber is insoluble in water and is unaffected by alkalis or moderately strong acids, but these substances may react with the non-rubber accessory substances present. Rubber is dissolved by benzol, petrol, carbon disulphide, chlorinated hydrocarbons, etc. It forms compounds with halogens, halogen acids, ozone, certain oxides of nitrogen, chromyl chloride and certain metallic halides. It is oxidised by nitric acid, potassium permanganate and hydrogen peroxide. It is also slowly affected by atmospheric oxygen, par-

ticularly in the presence of copper salts. It is reduced by hydrogen in the presence of a catalyst.

When rubber is heated at 120-160° C with sulphur it forms a product known as vulcanized rubber, which is stronger, more elastic and less affected by changes of temperature than the raw material. It is also insoluble in all the usual solvents. These changes are considerably modified by the amount of sulphur and heat applied and also (although to a lesser extent) by powders and other substances which may have been mixed with the rubber. With suitable adjustments it is possible to obtain from the raw materials a product which is as soft and elastic as an inner tube or as hard and brittle as a piece of vulcanite.

RUBBER: PRODUCTION AND MANUFACTURE.

Spanish explorers to the new world 400 years ago found the natives playing games with a ball made from latex, the fluid exudate of a tree. The first written reference to this gum was by Gonzalo Fernandez De Oviedo y Valdes in *La historia natural y general de las Indias*, published in Seville, 1535-57. The natives of tropical America referred to rubber by the names *Hevea*, "Olli" ("Ule"), "kik" and "cauchuc" (Spanish adaptation). In ancient Peru "cauchuc" was regarded as one of three substances with magical properties. Charles Marie de la Condamine, who was dispatched by the French government in 1731 on an expedition to study the shape of the earth, sent back from the Amazon a dark-coloured resinous material from *Hevea* trees called "caoutchouc" and reported: "Linen is covered with this material and used like oil-cloth at home; the natives make shoes of it which are waterproof. They also cover molds of earth, in the shape of bottles, with this material and when the resin is dry they smash the mold, take the pieces of earth out through the bottle neck, and have an unbreakable bottle which is useful for preserving all kinds of liquids." Some of the crude rubber found its way to England, where Joseph Priestley, discoverer of oxygen, observed that it rubbed out pencil marks and gave it the name "rubber." By 1825 "gum boots" of native make were imported into the United States. These were soon to be made on wooden lasts supplied by Yankee traders. This business reached a volume of 462,230 pairs in 1842. In 1831 similar shoes, made in a factory in the United States by coating fabric with a solution of rubber in turpentine, proved unsatisfactory as the rubber became soft in summer and stiff in winter and was degraded by turpentine. People in Europe and America, who had taken an interest in rubber, became disgusted with its limitations. The German F. Luedersdorff, 1832, and the American Nathaniel Hayward had found sulphur effective in lowering the tendency of rubber to grow sticky. Yet, it was Charles Goodyear's experiment (Jan. 1839) in cooking a mixture of rubber, white lead and sulphur on a kitchen stove that pointed the way to the commercial use of rubber. Thomas Hancock in England, working on the same problem, was shown samples made by Goodyear. The sulphur bloom on these samples prompted him to heat raw rubber in molten sulphur which effectively "vulcanized" the rubber as his friend William Brockedon termed the operation. Hancock patented his discovery in England in 1843, while Goodyear's U.S. patent was issued in 1844.

The discovery of hot vulcanization led to great activity in the manufacture of rubber in Europe and the U.S. In the United States, rubber footwear, waterproofed clothing, bumpers for railway cars, rubber balls and other articles were made until, by 1858, 10,000 workers, located mainly in New England and New

TABLE L.—Consumption by Countries of Natural and Synthetic Rubbers

*Estimated or partly estimated.

Jersey, were engaged in making rubber goods valued at nearly \$5,000,000. In 1870 rubber manufacturing was started in Akron, O., by B. F. Goodrich.

By 1910 Akron had become the greatest centre of rubber manufacture in the world. The manufacture of rubber articles at mid-20th century was being conducted on every continent and in all parts of the world, but most extensively in the

United States, United Kingdom, France, Canada and Germany. Important commercial developments in the production and manufacture of rubber goods comprise transportation items (used in the assembly of automobiles, aeroplanes, farm machinery, bicycles and other vehicles; see TYRE); the industrial products (belting, hose, packing, jar rings, typewriter platens, shock absorbers, sponge rubber and a host of other items); footwear and clothing; sports items (rubber balls, shoes and wearing apparel); druggists' sundries (hot-water bottles, bulbs, syringes and gloves); and novelty items (toys, balloons, aprons, stationers' bands, etc.).

Rubber Consumption.—The world consumption of natural rubber in long tons was 100,000 in 1910, 297,500 in 1920, 710,000 in 1930 and 1,110,000 in 1940. The increased rate of consumption was caused mainly by the development of automotive transportation. In each of years 1910 to 1940 (except 1944) 40% to 75% of the crude rubber used was consumed in the United States. The importance of synthetic rubber for general-purpose uses began to be recognized after 1940.

Two basic developments anticipated the growth of the modern rubber industry—the discovery of the hot vulcanization of rubber by Charles Goodyear of New Haven, Conn., 1839, and the noteworthy contributions of Thomas Hancock, England, 1820–56, who invented processes and machines the basic principles of which have continued to find widespread use in the industry. Hancock invented the masticator for kneading tough natural rubber into soft masses, the calendar, a set of squeeze rolls to sheet rubber or coat it on fabrics, and he used moulds, 1846, to form rubber articles under heat and pressure. Hancock was also among the first to recognize the advantages of forming articles from natural rubber latex. Both these pioneer inventors were unusually productive of new ideas. Between them they anticipated the use of rubber in making hundreds of new articles and laid the groundwork for almost every important development made by the industry. Contemporary with these two men were Charles Macintosh of London who introduced the practice of spreading fabrics with rubber solutions and doubling the plies to give the macintosh raincoat fabric, and Edwin M. Chaffee of Massachusetts who introduced the smooth roll mill for mixing rubber batches in 1835, and the first set of calendar rolls, 1836, for the frictioning of rubber masses onto fabric.

Other prominent technical advances in the rubber industry were the development of the applied science of compounding; the introduction of reclaimed rubber made from discarded rubber articles by a number of methods; the development of reinforcing pigments like the fine particle size carbon blacks which impart to cured rubber marked improvement in tear and abrasive wear; the advantageous use of rubber in composite structures with materials such as textiles, metals, wood, glass, asbestos and other components; the invention of many ingenious machines for use in the assembly of rubber articles; and the development and extensive use of synthetic rubber. The discovery of organic accelerators by George Oenslager of Akron, O., in 1906, benefited the industry by speeding up the vulcanization step and by making possible products of better quality and higher uniformity. The

discovery of age resisters, chemicals which retard the deterioration of rubber goods without affecting the state of vulcanization, was announced by Herbert Winkelman and Harold Gray in 1923, and by Sidney Cadwell in 1924.

Crude Rubber.—(See RUBBER: BOTANY, CULTIVATION AND CHEMISTRY.) The source of natural rubber is the latex of certain plants, mainly the tree *Hevea brasiliensis*. In plantation practice coagulated latex may either be washed and air dried to make "pale crepe" or sheeted and cured to form "smoked sheets." These two grades are the standard types of commercial rubber. Commercial grades include various types of ribbed smoked sheets, latex crepes, brown crepes, remilled crepes, flat bark crepes, fine Para, central scrap, Congo and guayule rubbers. Crude rubber is usually shipped in rectangular bales wrapped in sheets of similar rubber. The weight of a bale is about 224 lb. Originally, rubber came from wild trees and vines and was collected by natives of the region where these grew. Great variability and scores of different grades prevailed even for some time after the advent of plantation rubber, c. 1910. Washing and drying operations formerly widespread in the manufacturing industry are most extensively practised near the source of the rubber. A great deal of the rubber used by the factories is cleaned by straining in a screw-fed machine in the head of which is mounted a screen to retain foreign matter.

Synthetic Rubber.—After 1941 the use of synthetic rubber was necessary in the manufacture of rubber articles; first, because Japan captured Malaya, Indo-China and Indonesia—source of more than 90% of the world's rubber—and withheld crude rubber from world markets until its defeat in 1945; and, second, because the world production of crude rubber was inadequate to supply the demand after World War II. Scientists from mid-19th century had envisaged the possibility of getting from chemical reactions a product like rubber. The idea started when Michael Faraday, at the request of Hancock, made a chemical analysis of natural rubber and reported, 1826, the empirical formula C_4H_8 ; the German, C. Himly, in 1838 named the volatile distillate which he derived from rubber "Faradayine," a tribute to the pioneer chemist in the field of rubber; the French chemists, A. Bouchardat, 1837, and G. Bouchardat, 1875, starting from this type of distillate, made resinous products from it. C. Crepuze, who was the probable main component in Faradayine and that rubbery masses could be made from isoprene. His countryman, W. Tilden, 1892, reported that isoprene from turpentine gave products like yellowish masses on standing. But none of these experiments was rubber, the molecule that has never been created except in the latex cells of growing plants. Intense nationalism and bickering marred the progress of scientific discovery in the search for synthetic rubber after 1900. Contention increased as the need came for more and more rubber in world trade, and thus prompted large rewards in prestige and profit. Three Rus-

sian scientists made significant early discoveries. I. Kondakov in 1900 made leatherlike plastic masses from 2,3-dimethyl butadiene-1,3, the substance which about 1910 was to serve as the basis of the earliest chemical rubber made independently both in the United States and in Germany. S. V. Lebedev in 1910 converted butadiene-1,3 to a rubberlike product, which later became the most important molecule with which to start in the making of chemical rubbers; Lebedev also originated one of the simplest methods for obtaining butadiene from alcohol. A third Russian scientist, I. Ostromlensky, not only contributed valuable information on the source of butadiene, 1915, but also worked on the polymers of vinyl chloride, 1916, new giant molecules which by 1940 had proved of great industrial importance in supplementing rubber.

The German attempts to make synthetic rubber from dimethyl butadiene, 1910-18, led to a production of only 2,350 tons of the "methyl" rubbers—grades "W" for use in soft rubber goods and "H" in hard rubbers—but these rubbers were not competitive with natural rubber. Parallel with this early German effort, L. P. Kyrides (Kyriakides) and Richard Earle, 1910-13, worked out three processes for synthetic rubber for the Hood Rubber company near Boston, Mass. The most promising of these depended upon dimethyl butadiene from acetone and gave rubber from which satisfactory footwear was made at a high cost. C. Harries in Germany and F. E. Mathews and E. H. Strange in England independently in Oct. 1910 found metallic sodium an excellent catalyst for polymerization of butadiene and isoprene. This type of rubber was to be made commercially in the U.S.S.R. after 1928 under the designation SKB (based on alcohol) or SKA (based on petroleum).

The first commercially important and successful synthetic rubber, neoprene, was announced in 1931 for sale by E. I. du Pont de Nemours and company. Neoprene (first called Duprene) stemmed from the work of the Rev. Julius Arthur Niewland, S.J., and was perfected by the work of du Pont chemists, Wallace Carothers, Elmer K. Bolton and others, which started about 1925. Neoprene, made from 2-chlorobutadiene-1,3 (chloroprene), resembles natural rubber chemically more closely than any of the other chemical rubbers. Its finished products resist oil, sunlight and ozone, and are used widely. Consumption of neoprene annually averaged 43,000 long tons over the period 1944-48.

Buna Rubbers.—German chemists of I. G. Farben A. G. began an intensive search for a commercial synthesis of rubber about 1925. The numbered Buna rubbers, such as Buna 85 and Buna 115, were made by Lebedev's method from Butadiene and sodium (Natrium) whence the name "Buna," but these rubbers which ranged from a rubbery to a pitchy consistency were not of good enough quality to replace crude rubber in general use. Hence, the search was continued and led to the emulsion copolymerization of butadiene and styrene, two chemicals which the German industry could provide abundantly from grain alcohol and coal, respectively. The copolymer Buna S was made by charging the butadiene and styrene into a pressure vessel with soap, water and minor ingredients. The emulsion thus formed was transformed overnight into a suspension of rubbery particles, an opaque latex from which Buna S rubber was derived by coagulation with salts and acids. When washed and dried Buna S resembled crude rubber. By a similar method Buna N was formed from the reactants butadiene and acrylonitrile. The first large factory, capacity 24,000 metric tons, for the synthesis of these "lettered" Buna rubbers by the emulsion process was subsidized by the Nazi government and began operation about 1939. Those who were required to use Buna S to make rubber goods complained that it took two to three times as much milling capacity as natural rubber, but reports indicated that tires made from it gave good mileages. During the shortage of neoprene in 1937, Buna N from Germany was sold in the United States under the name "perbunan." Manufactured articles made from it gave good service in withstanding oil exposure.

After 1925 several polymers other than neoprene with properties akin to rubber were perfected and produced mainly in the United States. Some of these, such as the plasticized polyvinyl

esters (Koroseal, Vinylite, Geon), are of the nonvulcanizing type and are often listed as plastics, but their performance in uses once rendered only by cured rubber entitles them to rate as rubbery materials. The noncuring polyisobutylene and polyethylene were also used commercially to supplement rubber. Thiokol, 1928, a polyalkylene polysulphide, had a limited use, mainly for articles required to withstand lacquer solvents.

Perbunan, Hycar, Chemigum and Butaprene, all nitrile-butadiene rubbers of the oil-resistant type, not only replaced natural rubber in parts exposed to various oils but were used extensively in new fields such as compounding with synthetic resins to replace plasticizer (Polyblends) in making films for food packaging or as latex in paper impregnation. Silicone and Silastic rubbers, organic polymers containing silicon, support loads at temperatures in the range from -50°F. to 550°F. without loss of shape or insulating properties. At temperatures somewhat lower than 500°F. the sun-resistant Hycar P.A. (acrylate type) rubbers impart good elasticity under both compression and elongation.

In June 1940 the B. F. Goodrich company announced the Ameripol tire in which more than 50% of the rubber consisted of a butadiene copolymer, and the Standard Oil Development company announced butyl rubber for inner tubes. Butyl rubber was a polymer made at temperatures about -100°F. from isobutylene with only about 2%-5% of a diene such as isoprene.

GR-S.—In 1940 the United States began to recognize the threat of war to the world's supply of rubber. The Rubber Reserve company of the Reconstruction Finance corporation was created June 28, 1940, to build up domestic stocks of crude rubber from the alarmingly low level of 125,000 long tons at the end of 1939. The National Defense Advisory committee in Aug. 1940 held meetings with informed men in the rubber industry and drew up a program for 100,000 long tons a year capacity of synthetic rubber since private companies appeared unwilling to risk the capital needed to go ahead on this scale. Even the government at that time was reluctant to approve such a large operation, and in May 1941 scaled it down to about 40,000 long tons with plans for four plants, each of 10,000 tons capacity. Meantime, privately financed plants of 30,000-ton capacity were in prospect by 1942. After the attack by Japan on Pearl Harbor this government program was increased tenfold, and again doubled after the fall of Singapore. With relatively slight alterations these programs when completed had a capacity of 1,000,000 long tons a year of synthetic rubber. Even after their authorization the public was not convinced that they could be completed in time to supply the needs of the United Nations in a global war. Hence, on Aug. 6, 1942, Pres. Franklin D. Roosevelt appointed the Rubber Survey committee to study the rubber situation and make recommendations, with Bernard M. Baruch as chairman. The specific recommendations of the committee, Sept. 1942, were quickly enforced. These were rationing of motor fuel and tires, limiting driving speeds to 35 m.p.h., and for "bulling through" the gigantic synthetic program with the reorganization and consolidation of the government agencies then dealing with rubber. The president in Sept. 1942 created the Office of Rubber Director under the War Production board. Among the chemicals required each year to effect this synthetic program were 600,000 tons of butadiene, 220,000 tons from alcohol and the balance from petroleum feed stocks; 187,500 tons of styrene; about 100,000,000 pounds of soap, and smaller amounts of auxiliary chemicals, catalysts and solvents. Besides the plants to make these starting materials there were polymerization plants for GR-S (government rubber, styrene type, the general purpose rubber) and plants of entirely different design for the manufacture of butyl (GR-I) and neoprene (GR-M). Fifty-one plants were designed, built and operated by 49 rubber, chemical and industrial companies under the supervision of Rubber Reserve company. The estimated plant investment exceeded \$700,000,000. These operations involved full co-operation of the industry with the pooling of patents and the exchange of technical information under an agreement which extended from Dec. 19, 1941, to March 31, 1949. Plants were located mainly in Connecticut, Pennsylvania, Ohio, West Virginia, Kentucky, Louisiana, Texas,

Arkansas and California. The Canadian plant at Sarnia, Ont., under the dominion government, had a designed yearly capacity of 30,000 long tons of GR-S and 7,000 tons of butyl, with facilities for butadiene, styrene and isobutylene manufacture.

From 1945 on disposal of government-owned plants was actively studied by government agencies and by industry. U.S. public law 469 (1948) prescribed a minimum consumption of GR-S of 200,000 long tons a year with stand-by plant capacity up to 600,000 long tons to ensure national security, and with 65,000 long tons capacity for specialty rubbers, including those suitable for inner tube manufacture. The president of the United States, Jan. 1950, recommended the policy of selling government-owned plants to the industry under conditions that would ensure adequate supplies of the needed rubbers, encourage developments designed to improve their quality and restrain the ownership of the plants by a monopoly.

TABLE II.—Production of Synthetic Rubbers
(in long tons)

Year	United States				Germany	World total
	GR-S	Neoprene	Butyl	Nitrile type	Buna S	
1939		1,738		12	10,851	13,748
1940		2,460		91	36,350	42,386
1941	237	3,413	0	2,464	68,075	77,615

* Total of all types.

† Excluding German production.

‡ Not available.

The year 1948 marked the introduction of "cold" rubber made from the same basic ingredients as GR-S in an activated recipe at 41° F. compared with the temperature 122° F. ordinarily used. The road wear of tires made from cold rubber was improved over those from crude rubber by 10% to 25%. At the end of 1949 GR-S plants had been equipped to make up to 180,000 long tons a year of cold rubber.

MATERIALS USED IN THE INDUSTRY

Rubber Materials.—The new rubbers consumed by the industry, including natural and synthetic, comprise the largest tonnage of any material used.

Reclaimed Rubber.—Vulcanized rubber scraps (tires, tubes, footwear, etc.) are plasticized and are available for reprocessing by the ordinary methods of rubber goods manufacture. The process of scrap treatment is known as reclaiming and the product as reclaimed rubber, reclaim or shoddy. The two methods most extensively used are the alkali process, patented by A. H. Marks, 1899, and the heater process, in which pans of scrap rubber, softeners and caustic are exposed to steam at about 350° F. Reclaim originates in at least 23 countries with an aggregate reclaiming capacity estimated as of 1945 at 530,000 long tons. Reclaim blends readily with crude rubber and GR-S to give compositions which process smoothly and is of great economic importance as a supplement to the new rubber consumed by the industry. In 1948 the tonnage of reclaim consumed by the U.S. manufacturing industry was 25% of the total new rubber consumption. Proportionate consumption in 1939 was 29% and in 1942 was 65%.

Scrap.—Unvulcanized trimmings containing no fabric or other materials are not waste. They may be blended with fresh stocks of the same composition and utilized with no loss of material value. Unvulcanized waste containing fabric may be treated to pulverize the fabric and utilized in rubber compositions with some reduction in value. Even vulcanized waste is incorporated in certain goods.

Dry Pigments.—Reinforcing and Filling Pigments.—Powdered materials are blended with rubber materials in order to modify the stiffness, strength and resistance to abrasion or chemical action of the vulcanized rubber. Reinforcing pigments possess the property of stiffening and strengthening rubber com-

positions so that the total energy necessary to extend a strip of the compound to its breaking point is greater than that necessary to stretch a similar mix containing only rubber, sulphur and accelerator. Fillers, though they may stiffen the vulcanized compound, do not increase the total energy of rupture. Carbon blacks of two types (impingement and furnace), zinc oxide, certain clays, calcium silicate and magnesium carbonate are common reinforcing pigments. Whiting and barytes are extensively used as fillers.

Colours.—Most of the colours for rubber goods are useful in powdered form, and few colours soluble in rubber are used. For white goods, zinc oxide, lithopone, titanium oxide and zinc sulphide are used. Reds, blues, yellows and other colours and shades are secured with pigments such as ferric oxide, ultramarine blue and zinc carbonate. The utilization of certain organic dyestuffs (phthalocyanine colours) and certain salts of azo dyes has enhanced the aesthetic appeal of rubber articles.

Other Compounding Ingredients.—Softeners.—For modifying the characteristics of the vulcanized rubber mixtures and for improving their properties for ease in processing, many kinds of softening materials are incorporated in rubber stocks. Petroleum products from oils to paraffin wax, tars, oxidized petroleum residues (mineral rubber), rosin, pine tar, fatty acids or their zinc salts, and many others are common to the industry. For use with the synthetic rubbers, resins derived from coal by distillation and by ensuing chemical treatments of distillates have been highly regarded.

Vulcanizing Agents.—By far the commonest vulcanizing agent is sulphur, used in the form of ground brimstone. The proportion used depends upon the character of the product required. Soft rubber goods carry from 2 to 10 parts of sulphur, but in most compounds not more than 3½ parts per 100 of rubber are used. Synthetic rubber articles in general require about four-fifths as much sulphur as those made from crude rubber. Compositions unusually resistant to natural deterioration are produced containing less than 1% of sulphur. Hard rubber compositions carry 20% to 50%. Some organic sulphur compounds which liberate sulphur at vulcanizing temperatures have been used in special cases without addition of sulphur itself. Selenium and tellurium will produce vulcanization also, and have been used to some extent, usually, however, with some sulphur. Benzoyl peroxide, dinitro- and trinitro-aromatic compounds, dioximes, disulcyanates and dinitroso-compounds also vulcanize rubber.

Accelerators of Vulcanization.—Vulcanization of rubber by sulphur alone proceeds at a slow rate and almost invariably suitable materials, called accelerators, are added to the rubber mixes to hasten the process. From the time of Goodyear's experiment, in which he used white lead, until 1906, the only accelerators used were inorganic oxides or hydroxides—litharge, white lead, quick or slaked lime, magnesia. Organic accelerators shortened the time of vulcanization and enhanced the tensile and other properties of the vulcanizate. The early accelerators (1906)—thiocarbonyl and para-amino dimethyl aniline—gave way to diphenyl guanidine, mercaptobenzothiazole, the aldehyde-amines, thiazuram sulphides and many newer chemicals. The activity of accelerators is improved by secondary ingredients such as zinc oxide, litharge or magnesia, and even by other organic accelerators. They are often further assisted by acid materials, such as oleic or stearic acids or pine tar. Pneumatic tires, formerly requiring three hours for vulcanization without accelerators, are vulcanized by the action of organic accelerators in less than an hour. Deterioration of rubber may be greatly retarded by the use of certain accelerators.

Age Resisters.—Deterioration of vulcanized rubber in storage or in service may be retarded also by incorporating in the mixture, before vulcanization, 0.5% to 6% of certain organic chemicals which have practically no effect on the vulcanization rate but greatly retard the rate of oxidation or change in properties of the vulcanized product. Some age resisters also impart to rubber compounds resistance to deterioration by heat and resistance to cracking under repeated flexure. The age resisters used in largest volume are secondary amino compounds. The

term "antioxidant" is widely used in referring to the behavior of chemicals which retard the deterioration of rubbers. While crude rubber from most sources contains a natural antioxidant, it is necessary to stabilize synthetic rubbers by the incorporation of 1% to 2% antioxidant in their manufacture to keep these rubbers fresh during storage. Usually, additional antioxidant is used in compounding these rubbers.

Other Materials.—Factice is made either by the action of sulphur chloride on vegetable oils—white substitute—or by heating these oils with sulphur—brown substitute. White substitute is used in cold vulcanized articles (see below) and brown substitute in hot vulcanized goods.

TECHNOLOGY

"Compounding" is that branch of technology concerned with systematic study of the composition and physical properties of natural and synthetic rubbers and their vulcanizates in relation to the performance of rubber articles. Compounding, as an applied science, has contributed to the growth of the industry by testing and specifying those compositions which perform best under severe service. As a result of these technical advances by anonymous compounders, rubber has come to be properly regarded as a state of matter rather than the specific hydrocarbon analyzed by Faraday in 1826. In the United States during World War II the consumption of new rubber changed from 96% natural in 1942 to 80% synthetic in 1944. The fact that the performance of rubber products remained without interruption at a very high level during this period is a tribute to the compounders. (The term "compounding" is also used to refer to the weighing of the various ingredients in preparation for the factory mixing of rubber batches, but in this article "compounding" will be used only in the technological sense.) Certain physical properties of compositions based upon natural and synthetic rubbers are shown in Table III and Table IV.

TABLE III—Properties of Widely Used Rubbers
(Not loaded with pigment)

Property	Unit	Natural rubber (Hevea)		Synthetic rubber vulcanizates	
		Un- vul- canized	Vul- canized	GR-S*	Neoprene GN

*The corresponding values for Buna S are as follows: Tensile 300-450, hardness 20-35, permanent set 5-10, modulus of elasticity at 300% elongation 12-20, specific gravity at 20° C. 1.00, permeability for H₂ 30, brittle point -58, volume resistivity 10¹⁴, dielectric strength 30-35, dielectric constant X 10³ 3.4, power factor X 10⁴ 7-8.
†Special insulating mix.

Properties of Vulcanized Rubber.—Typical uses of rubber in the unvulcanized state are for cements, surgical adhesive tape, insulating tape and crepe soling. Nearly all rubber depends upon vulcanization and compounding for the properties which make it useful. The primary properties which lead to the wide use of rubber comprise high elongation with rapid recovery over a wide range of temperatures, the cohesive strength with flexibility needed

to cushion shocks and impacts, impermeability to gases and to water, and low specific gravity. Moreover, rubber compositions are relatively unaffected by oxygen, acids, bases, many organic solvents and other chemicals, and show good electrical properties. Outstanding among other materials is the performance of rubber against abrasive wear which accounts for many of its applications such as in transportation, conveyor belts, chutes, linings and air hose. Among the various rubbers, natural rubber compounds have relatively the lowest hysteresis and the best resistance to cutting, chipping and crack growth. Of the compounded synthetic rubbers, butyl has the lowest permeability by gases, GR-S (cold rubber) shows the best tread wear, the nitrile rubbers show the least swelling in oils and most solvents, the acrylate rubbers (consisting mainly of polyethyl acrylate) are remarkably resistant to dry heat and sunlight, and neoprene is notably unaffected by ozone.

Laboratory Controls and Specifications.—Incessant technological changes within the industry have been made possible only by vigilant control over quality at every step in manufacture. Chemical and physical tests on the raw materials, the rubber mixtures in process and on the end products of manufacture have become routine. For example, tread mixings are tested for specific gravity, for plasticity and for cured hardness to ensure uniform performance on the road. More accurate testing methods have led to rigorous specifications governing the selection of materials, the operations of processing and assembly and the performance of finished products.

Cleaning and Straining.—See section on *Crude Rubber* above.

Washing and Drying.—See section on *Crude Rubber* above.

Mastication.—Unvulcanized rubbers are softened by the influence of temperature, oxidation and mastication. Crude rubber breaks down, loses toughness when masticated, and most effectively when the mill rolls are chilled. This type of softening is due to oxidation under the electrical stresses generated by friction. Both crude and synthetic rubbers are more quickly masticated for large production operations at temperatures c. 350° F. in which process temperature is the important variable. Chemical softeners usually of the thio-aromatic type may be incorporated in amounts customarily under 1% to facilitate mastication, but these are not used in most batches. Rubber is often plasticized on two-roll mills and in internal mixers, but by far the largest tonnages are passed through powerful extrusion type (Gordon) plasticators in preparation for the subsequent steps.

Mixing.—The mixing operation is the most important of all through which the rubber compositions pass in the fabrication of goods. In fact, proper running in all subsequent operations depends upon the mixing operation having been properly performed.

Mixing mills vary in size from 24 in. to 84 in. in width. The 84-in. mills are the largest in common use. They consist of two parallel, horizontal rolls set close together side by side and revolving in opposite directions. The back roll is fixed in position and geared directly to a drive shaft; the front roll is floating. The clearance between the rolls is adjustable by means of set screws near the ends of the front roll. Rolls are made of cast iron with chilled surface. The rolls of 84-in. mills are 24 in. or 26 in. in diameter, cast hollow and fitted for service with internal perforated pipes for the introduction of cooling water. The procedures for mixing batches containing crude rubber, reclaim or one of the chemical rubbers will differ somewhat from each other. It is essential, however, in all cases, that all parts of the batch be uniformly blended. This blending is secured by cutting the sheet on the mill roll with a sharp knife, beginning at one end and rolling it on itself until the sheet has been cut almost entirely across. The roll thus formed is permitted to sheet out again on the mill and the process repeated in the opposite direction. This is repeated six or seven times to secure uniform mixtures. Mills of 84-in. width will mix batches from 150 lb. to 300 lb. in 25 min. to 40 min. Internal (Banbury) mixers have been used extensively since c. 1927 for nearly all large tonnage formulations. These closed mixers handle batches weighing up to 1,000 lb., operate at higher temperatures than roll mills and may do the mixing in a time interval as short as five minutes to eight minutes. A typical large Banbury mixer, three stories in height, is provided with a hydraulic ram which is lifted as soon as the rubber is sufficiently softened and jammed home after the charge of carefully weighed pigments has been added. Two irregularly shaped opposing rotors knead the contents together by a powerful smearing action. The energy is supplied at such a rate that much heat is generated. To avoid preclude the sulphur and vulcanizing ingredients are often added later on 84-in. mills, three of which serve the Banbury, and sheet out the finished batch stock.

Calendering.—The calendering operation produces sheeted stock by pressing the rubber between rolls to form sheets of predetermined size and thickness. Calenders of various types and sizes are used in the industry. The usual type, a three-roll calender, consists of a heavy vertical frame holding adjustable horizontal rolls. The rolls can be driven either at even speed or at odd speed, and heated or cooled by internal circulation. Sheeted calenders are usually operated with the rolls at even speed and at 10 yd. to 30 yd. per minute. Calenders 100 in. wide with rolls 30 in. in diameter are the largest used in the industry. Sheets varying in thickness from point to point and sheets with embossed surfaces are also run on calenders equipped with special rolls. Footwear calenders are four-roll machines with engraved or embossed rolls so mounted that they are quickly detachable. Frictioning calenders for rubberizing fabrics are run so as to squeeze the rubber into the meshes of the fabric. The driven middle roll bears the rubber and delivers the sheet at a slightly faster speed than the bottom roll which supports the fabric. The frictioning process may be repeated on the opposite face of the fabric. Coating calenders of the three-roll type operate with the lower two rolls at even speed. The rubber sheet is firmly pressed against the prepared fabric as it passes through the calender but is not forced through the meshes as in frictioning. Successive operations of frictioning and coating are frequently employed. The use of the four-roll calender to coat both faces of the prepared fabric simultaneously has found wide acceptance, particularly in the tire industry. In a typical operation, parallel cords delivered from a creel are treated with latex, dried and fed between the squeeze rolls of the coating calender where uniform coats of rubber from the second and third rolls are compressed so as to join and surround the cords, thus forming a single ply of cord tire fabric. Coating calenders are run at speeds of 10 yd. to 40 yd. per minute.

Tubing Operations.—Tubing machines, or extruding machines, are devices for forcing continuous strips of rubber from a die. These strips may be tubular, rectangular or any one of a great variety of irregular cross-sectional shapes. The tubing machine consists of a horizontal cylinder in which a power-driven screw

rotates, forcing the rubber stock through a die inserted at the end of the machine. They are used for the production of tubing, hose tubes, pneumatic tire treads, solid tire treads, inner tubes for pneumatic tires, channel rubber slides for the windows of automobiles and many other articles.

Cements.—Among the oldest of all operations in the industry is the preparation of solutions of rubber in organic solvents (cements). For each rubber variety the solvent must be properly chosen. Cements are usually prepared in enclosed churns with stirring. The relative importance of cements to dry mixing operations and to latex applications has lessened since c. 1930.

Spreading.—The fabric is drawn over a roller under a spreader knife, which can be set at varying distances from the roll, carrying from a cement feed a thin layer of the cement, and then over steam-heated pipes to evaporate the solvent. This process is repeated until the required thickness of rubber coating is built up. By this method the rubber surfacing is applied to shoe cover and backing cloth, halloon fabrics, printers' blankets for offset work and similar products. Thin coatings similarly applied are used to improve the adhesion of fabric of rubber layers later applied on a calender. Cements applied by brushing are extensively used in the manufacture of rubber articles, notably footwear.

Vulcanization (Curing).—Before vulcanization, rubber is weak, softened by moderate heat, rendered stiff by cold, soluble in gasoline or other solvents and easily plasticized and sheeted between warm rolls. After vulcanizing it is strong, not greatly softened by heat nor stiffened by cold, insoluble in gasoline, and will crumble if run between rolls. Unvulcanized rubber is easily deformed to assume new shapes permanently; vulcanized rubber returns to its original shape after deformation. The vulcanization process most generally

used is the hot air method. It is carried out in a hot air oven or in a hot air curing chamber. The articles are placed in the oven or chamber and the door is closed. The heat is maintained at a temperature of 150° C. to 180° C. for a period of 1 to 2 hours. The articles are then removed and cooled. The vulcanization process is also carried out in a hot air oven or in a hot air curing chamber. The articles are placed in the oven or chamber and the door is closed. The heat is maintained at a temperature of 150° C. to 180° C. for a period of 1 to 2 hours. The articles are then removed and cooled.

Press Curing in Moulds.—Presses consist of parallel-faced, steam-heated plates between which are placed metal moulds in which the articles are formed. Pressure between the plates (platens) is secured hydraulically with the article receiving its heat only by conduction through the plates and mould faces, not by contact with steam. Most presses in production are provided with more than two platens to accommodate the work scheduled for them. Hollow articles like syringe bulbs, tennis or toy balls are vulcanized in moulds under inflation either by air or by nitrogen generated by the action of heat upon such a mixture as sodium nitrite and ammonium chloride in pelleted form. Special presses are made for curing long flat belts, a section of 20 ft. to 36 ft. being cured at one time. Heavy conveyor belts, made in this fashion, may weigh 30,000 lb.

Lead Coating for Curing.—Garden hose made in long lengths is run through a lead press and covered with a lead sheath. A 500-ft. length thus covered is wound on a drum and water connections leading outside the heater are made at both ends. A number of the drums are placed side by side in a horizontal, cylindrical vulcanizer and hot water under pressure run through the hose, while steam is admitted to the vulcanizer. In this manner, heat is applied simultaneously from both sides of the rubber structure and the internal water compacts the hose against the lead sheath. The lead covering is stripped, melted and used again for covering.

Open Steam Curing.—Articles which require no further forming than is produced in building operations may be vulcanized without enclosure in moulds. Steam is permitted to come into contact either with the bare goods or with wet fabric wrappings around them. Air brake hose is built on mandrels, wrapped tightly with wet cloth and vulcanized by steam directly surrounding the wrapped hose. Pressure may be applied during vulcanization in open steam to articles built on hollow forms. Boots and shoes, for example, built on hollow, perforated lasts, each of which is connected in the vulcanizer with a vent to the atmosphere, receive from the steam around them only the heat necessary for vulcanization, but also mechanical pressure which forces out the air between the shoes and the forms and between the separate pieces composing the goods.

Continuous Curing of Insulated Wire.—Wire covered with a rubber insulation compound which cures rapidly is passed continuously through superheated steam in long steel pipes to effect vulcanization of the rubber in about one minute. The nipples for passing the wire in and out of the vulcanizer are sealed by a slip fit between the rubber cover of the wire and the wall of the nipple.

Water Curing.—Some rubber goods are cured immersed in hot water

PREPARING RUBBER FOR COMMERCIAL USES

1. Native tapping a rubber tree for latex
2. The latex, after being sieved and diluted, is placed in tanks containing acetic acid or other coagulum. The rubber rises to the surface in the form of white coagulum
3. The coagulum is passed through a series of sheeting rolls which press out most of the moisture. Following this operation, the sheets are out to length and sent to the smokehouse
4. A plantation smokehouse, where the rubber sheets are hung on long

racks. A fire is kept burning continuously in the lower part of the building. The smoke passes over baffles into the upper chamber, where it comes into contact with the sheets before it passes out through vents in the top. The smoking process takes from one to two weeks

5. Making crêpe rubber from coagulum. The rolls rotate at different speeds, thus giving the typical crêping action
6. Crêpe rubber is air-dried in sheds in order to preserve the natural light colour. This drying process takes from four to five weeks

RUBBER MANUFACTURE AND PRODUCTS

1. Rubber conveyor belt elevator, 14 stories high, lifts 100 tons of rock every hour.
2. GR-S polymerizers in a U.S. government rubber plant, Port Neches, Tex.
3. Two-roll mixing mill. The batch shown is white sidewall stock for passenger-car tires.
4. Mould curing. Dome-type vulcanizers are hinged like waffle irons. The tire is shown before (right) and after cure. Interval curing bags transmit both heat and pressure.
5. The creel starts about 3,000 parallel cords on their way to form the sandwich between sheets of rubber at the coating calender. Such a sandwich makes up one ply in a passenger-car tire.
6. Butadiene row, in Port Neches, Tex. Still columns which separate butadiene from cracked petroleum feed stock.

under pressure. The pressure may be equal to or greater than that of saturated steam at the same temperature. Rubber sheet to be cut into thread is wrapped with wet cloths on drums, covered with a vulcanized rubber sheet and cured under water. To secure a smooth surface on sheets of hard rubber the unvulcanized stock is rolled on sheeted tin, a number of these slabs piled together and vulcanized under water.

Air Curing—Varnished footwear and shoes containing wool fabrics are cured by heating in air, which is used most effectively under pressure and circulated by pumps.

Sulphur Chloride Curing—The process of cold vulcanization was discovered in 1836 by Alexander Parkes in England. It is conducted by exposing rubber surfaces to sulphur chloride as vapour or in solution. Cold curing was practised extensively in the "dipped goods" industry to make thin articles like surgeon's gloves and finger cots on foams by repeated dipping in rubber cements. The curing of the thin rubber tissues in the vapour of sulphur chloride was followed by a neutralizing exposure to ammonia gas. Dental dam, a calendered sheet, is cured by this process, but most of the articles formerly made by dipping and cold curing have more recently been made from compounded latex and in some instances from pre-vulcanized latex.

Hard Rubber Vulcanization—The commercial heating of rubber with large proportions of sulphur was first actively studied by Nelson Goodyear, who patented in 1851 a process for making hard rubber (ebonite). Articles of hard rubber are ordinarily formulated with 50% to 60% sulphur on the weight of the rubber, often with numerous other ingredients. Typical cures for these articles are carried out at higher temperatures and over longer periods than for soft rubber articles. Extensive heat evolution, and volume shrinkage and the generation of some hydrogen sulphide gas accompany ebonite vulcanization. Hence, cures are most frequently conducted in steam or water. Small masses of hard rubber can be cured in moulds.

Assembly Operations—Primitive fabrication, e. g., of rubber hand stripped from fine Para biscuits was by cutting these sheets into patterns, forming articles from the pieces and joining the seams by compression or the use of rubber cement. The evolution of the industry has progressed through cement dipping and spreading, through mastication, mixing and calendering, through the use of pressure moulding and vulcanization, away from the handicraft arts toward mass production methods in which machines continue to replace human labour. In the industry the principle of flat-built assembly was in 1950 widely prevalent. Films of rubber from cement or latex were flowed by machine onto hundreds of rotated can ends a minute to form grates for pressure sealing; conveyor and transmission belts were built on tables from plies of frictioned and coated fabrics and cured in flat presses. Rubber footwear starts with plies of rubberized fabric and sheeted rubber to be punched out into pieces of many sizes and shapes on toggle presses. These parts are placed in flat books ready for the building assembly on shoe or boot lasts. Passenger car tires (see Tyres) start with coated cord fabric plies and vulcanized tread sections. The final assembly, including the dipping, insulated wire beads, is made on a steel drum. The industry consistently favoured machine assembly operations and conveyor installations which reduced drudgery, enhanced uniformity and quality of products and markedly lowered costs to the consumers.

Latex—Hevea latex from far eastern and Liberian plantations usually reaches the market in concentrated form of about 60% total solids with ammonia as the preservative. Various synthetic rubbers, mainly of U.S. production, including the nitrile rubbers, are also available as latices. Suitably compounded with ingredients in finely divided aqueous dispersions, these latices find extensive use commercially in the treatment of tire cord for improved adhesion and in numerous novel applications whereby articles are formed by coating, dipping, casting inside or outside of porous forms, by ionic coagulation and by electrodeposition. The latter process, and a type of ionic coagulation, are covered by patents of the American Anode company.

Pre-vulcanized latex compounds are available in most countries made by a process originated by Philip Schidrowitz, of London, Eng. Latex compounds have been made available both to the industry and to artists and craftsmen by the latex suppliers who are usually the large manufacturers of rubber. These latices which require vulcanization give sheets of tensile strengths in excess of 5,500 psi. while sheets made from pre-vulcanized latex test over 4,000 psi.

(H. L. Tr.)
RUBBER ACCELERATORS are substances which increase the rate or lower the temperature of the vulcanization of rubber (see RUBBER: PRODUCTION AND MANUFACTURE).

RUBBLE, broken stone, of irregular size and shape. This word is closely connected in derivation with "rubbish," which was formerly also applied to what we now call "rubble."

"Rubble-work" is a name applied to several species of masonry (q.v.). One kind, where the stones are loosely thrown together in a wall between boards and grouted with mortar almost like concrete, is called in Italian *muraglia di getto* and in French *bocage*.

RUBELLITE, a red variety of tourmaline (q.v.) used as a gem-stone. It generally occurs crystallized on the walls of cavities in coarse granitic rocks, where it is often associated with a pink lithia-mica (lepidolite). The most valued kinds are deep red; the colour being probably due to the presence of manganese. Some of the finest rubellite is found in Siberia. The mills at Ekaterinburg, where it is cut and polished, draw most of their supplies from the Urals—chiefly from Mursnka, Sarapulskaya and Shaitanka—but specimens are occasionally found at Nerchinsk in Transbaikalia. Burma is famous for rubellite; the pits which yield it are dug in alluvial deposits in the Mönglong valley, some miles to the S.E. of Mogok, the centre of the ruby country. Very fine rubellite is found in the United States, notably at Mount Mike, near Paris, Oxford Co., Maine, where the crystals are often red at one end and green at the other. Mount Rubellite, near Hebron, and Mount Apatite at Auburn, are other localities in the same State from which fine specimens are obtained. Chesterfield and Goshen, Mass., also yield red tourmaline, frequently associated with green in the same crystal. Pink tourmaline also occurs, with lepidolite and kunzite, in San Diego Co., California. In Europe rubellite occurs sparingly at a few localities, as at San Piero in Elba and at Penig in Saxony.

RUBENS, PETER PAUL (1577–1640), Flemish painter, was born at Siegen, in Westphalia, on June 29, 1577. His father, Johannes Rubens, a druggist, although of humble descent, was a man of learning, and councillor and alderman in his native town (1562). A Roman Catholic by birth, he adopted the Reformed faith, and we find him spoken of as *le plus docte Calviniste qui just pour lors au Bas Pays*. After the plundering of the Antwerp churches in 1566, Johannes Rubens hastily quitted Spanish soil, ultimately settling at Cologne (October 1568) with his wife and four children.

Here he became legal adviser to Anne of Saxony, the second wife of the prince of Orange, William the Silent. Before long it was discovered that their relations were not purely of a business kind. Rubens was imprisoned at Dillenburg for two years, and after that he was confined to the small town of Siegen. Here he lived with his family from 1573 to 1578, and here Maria Pype-linx gave birth to Peter Paul. A year after (May 1578) he returned to Cologne, where he died on March 18, 1587.

Rubens went to Antwerp with his mother when he was scarcely ten years of age. He was an excellent Latin scholar. Part of his boyhood he spent as a page in the household of the countess of Lalaing at Audenarde but soon his mother allowed him to follow his proper vocation, choosing as his master Tobias Verhaecht, a landscape painter. From 1592–96 he worked under Adam Van Noort, whose aspect of energy is well known through Van Dyck's beautiful etching, the highly esteemed master of numerous painters—among them Jordaens, later his son-in-law. Rubens thereafter studied under Otto Vaenius of Van Veen, a gentleman by birth

and a court painter to archduke Albrecht, sovereign of the Spanish Netherlands. In 1598, Adam Van Noort acting as dean of the Antwerp gild of painters, Rubens was officially recognized as "master." His style at this early period may be judged from the "Annunciation" in the Vienna Museum.

Italian Period.—From 1600 to the latter part of 1608 Rubens belonged to the household of Vincenzo Gonzaga, duke of Mantua. The duke, who spent some time at Venice in July 1600, had his attention drawn by one of his courtiers to Rubens's genius, and induced him to enter his service. The influence of the master's stay at Mantua was of extreme importance to his artistic development. Sent to Rome in 1601, to take copies from Raphael for his master, he was also commissioned to paint several pictures for the church of Santa Croce, by archduke Albrecht. "St. Helena with the Cross," "The Crowning with Thorns" and "The Crucifixion" are to be found in the hospital at Grasse in Provence.

At the beginning of 1603, "The Fleming," as he was termed at Mantua, was sent to Spain with a variety of presents for Philip III. and his minister the duke of Lerma, and thus had opportunity to spend a whole year at Madrid and become acquainted with some of Titian's masterpieces. Among his own works, known to belong to the same period, in the Madrid Gallery, are "Heracitus" and "Democritus." Of Rubens's abilities so far back as 1604 we get a more complete idea from an immense picture now in the Antwerp Gallery, the "Baptism of Our Lord," originally painted for the Jesuits at Mantua. Here may be seen the influence of Italian surroundings on the painter. Vigorous in design, he reminds us of Michelangelo, while in decorative skill he seems to be descended from Titian and in colouring from Giulio Romano. Executed simultaneously with this picture, were "The Transfiguration," now in the museum at Nancy, and the portraits of "Vincenzo and his Consort, kneeling before the Trinity," in the library at Mantua. To 1606 belong a large altar-piece of "The Circumcision" at St. Ambrogio at Genoa, the "Virgin in a Glory of Angels" and two groups of Saints, painted on the wall, at both sides of the high altar in the church of Santa Maria in Valicella in Rome.

Return to Antwerp.—While employed at Rome in 1608, Rubens received alarming news of his mother's health. He at once set out for the Netherlands. When he arrived in Antwerp, Maria Pypelinx was no more. His wish to return to Italy was overruled by the express desire of his sovereigns, Albrecht and Isabella, to see him take up a permanent residence in the Belgian provinces. On Sept. 23, 1609, Rubens was named painter in ordinary to their Highnesses, with a salary of 500 livres, and "the rights, honours, privileges, exemptions," etc., belonging to persons of the royal household, not to speak of the gift of a gold chain. Not least in importance for the painter was his complete exemption from all the regulations of the gild of St. Luke, entitling him to engage any pupils or fellow-workers without being obliged to have them enrolled—a favour which has been of considerable trouble to the historians of Flemish art. By order of the municipality he painted the first among the numerous repetitions of the "Adoration of the Magi," a picture in the Madrid Gallery, measuring 12 ft. by 17, and containing 28 life-size figures, many in gorgeous attire, warriors in armour, horsemen, slaves, camels, etc.

Apart from his success, another powerful motive had helped to detain the master in Antwerp—his marriage with Isabella Brant (Oct. 13, 1609). Many pictures have made us familiar with Isabella. We meet her at The Hague, Leningrad, Berlin, Florence, but more especially at Munich, where Rubens and his wife are depicted at full length on the same canvas. "His wife is very handsome," observes Sir Joshua Reynolds, "and has an agreeable countenance"; but the picture, he adds, "is rather hard in manner." This, it must be noted, is the case with all those pictures known to have immediately followed Rubens's return, when he was still dependent on the assistance of painters trained by others than himself. Even in the "Raising of the Cross," now in the Antwerp cathedral, and painted for the church of St. Walburga in 1610, the dryness in outline is striking. The picture is tripartite, but the wings only serve to develop the central composition, and add to the general effect. In Witdoeck's beautiful engraving the

partitions disappear. Thus, from the first, we see Rubens quite determined upon having his own way, and it is recorded that, when he painted the "Descent from the Cross," "St. Christopher," the subject chosen by the Arquebusers, was altered so as to bring the artistic expressions into better accordance with his views. Although the subject was frequently repeated by the great painter, this first "Descent from the Cross" has not ceased to be looked upon as his masterpiece. Begun in 1611, the celebrated work was placed in 1614. Rubens received 2,400 florins for this picture. In many respects, Italian influence remains conspicuous in the "Descent from the Cross." Rubens had seen Ricciarelli's fresco at the Trinità de' Monti, and was also acquainted with the grandiose picture of Barocci in the cathedral of Perugia. But in Rubens strength of personality could not be overpowered by reminiscence; and the "Descent from the Cross" may be termed thoroughly Flemish.

If Sir Dudley Carleton could speak of Antwerp in 1616 as *Magna civitas, magna solitudo*, there was no place nevertheless which could give a wider scope to artistic enterprise. Spain and the United Provinces were for a time at peace; almost all the churches had been stripped of their adornments; monastic orders were powerful, and corporations eager to show the fervour of their Catholic faith, now that the "monster of heresy" seemed for ever quelled. Gothic churches began to be decorated according to the new fashion adopted in Italy. Altars magnified to monuments, sometimes reaching the full height of the vaulted roof, displayed, between their twisted columns, pictures of a size hitherto unknown. No master seemed better fitted to be associated with this kind of painting than Rubens. The church of St. Charles, erected by the reverend fathers in Antwerp, was almost entirely the painter's work, and if he did not, as we often find asserted, design the front, he certainly was the inspirer of the whole building. Hitherto no Fleming had undertaken to paint ceilings with foreshortened figures, and blend the religious with the decorative art after the style of those Italian buildings which owe their decorations to masters like Titian, Veronese and Tintoretto. Thirty-nine ceiling-panels were composed by Rubens, and painted under his direction in the space of two years. All were destroyed by fire in 1718.

Rubens delighted in undertakings of the vastest kind. "The large size of a picture," he writes to W. Trumbull in 1621, "gives us painters more courage to represent our ideas with the utmost freedom and semblance of reality. . . . I confess myself to be, by a natural instinct, better fitted to execute works of the largest size." The correctness of this appreciation he demonstrated by a series of twenty-four pictures, illustrating the life of Marie de' Medici, queen-mother of France. The gallery at the Luxembourg Palace, which these paintings once adorned, has long since disappeared, and the complete work is now exhibited in the Louvre. The sketches of all these paintings—now in the Munich Gallery—were painted in Antwerp, a numerous staff of distinguished collaborators being entrusted with the final execution. But the master himself spent much time in Paris, retouching the whole work, which was completed within less than four years. On May 13, 1625, Rubens writes from Paris to his friend Peiresc that both the queen and her son are highly satisfied with his paintings, and that Louis XIII. came on purpose to the Luxembourg, "where he never has set foot since the palace was begun sixteen or eighteen years ago." We also gather from this letter that the picture representing the "Felicity of the Regency" was painted to replace another, the "Departure of the Queen," which had caused some offence. Richelieu gave himself some trouble to get part of the work, intended to represent the life of Henry IV., bestowed upon Cavalier d'Arpina, but did not succeed. The queen's exile, however, prevented the undertaking from going beyond a few sketches, and two or three panels, one of which the "Triumph of Henry IV.," now in the Uffizi Gallery, is one of the noblest works of Rubens or of any master.

Rubens's comprehension of religious decorative art is disclosed in the "Assumption of the Virgin" at the high altar of Antwerp cathedral, finished in 1626. Every outline is bathed in light, so that the Virgin is elevated to dazzling glory. Rubens penetrates

into the spirit of his subjects more deeply than, at first sight, seems consistent with his prodigious facility in execution. The "Massacre of the Innocents," in the Munich Gallery, is a composition that can leave no one unmoved.

Diplomatic Activity.—In the midst of his activity as a painter, Rubens was now engaged on diplomatic business. The truce concluded between Spain and the Netherlands in 1609 ended in 1621; Archduke Albrecht died the same year. His widow wished to prolong the arrangement, still hoping to see the United Provinces return to the Spanish dominion, and in her eyes Rubens was the fittest person to bring about this conclusion. The French ambassador writes from Brussels in 1624—"Rubens is here to take the likeness of the prince of Poland, by order of the infant. I am persuaded he will succeed better in this than in his negotiations for the truce." But, if Rubens failed to bring about an arrangement with the Netherlands, other events enabled him to render service to the state.

Rubens and Buckingham met in Paris in 1625; a correspondence of some importance had been going on between the painter and the Brussels court, and before long it was proposed that he should endeavour to bring about a final arrangement between the Crowns of England and Spain. The infant willingly consented, and King Philip acceded on hearing that the negotiator on the English side, Sir Balthasar Gerbier—a Fleming by birth—was likewise a painter. Rubens and Gerbier met in Holland, and Rubens volunteered to go to Spain and lay before the council the result of his negotiations (1628). The nine months then spent at Madrid rank among the most important in Rubens's career. He had brought with him eight pictures as presents from the infant, and he was also commissioned to paint several portraits of the king and royal family. Philip delighted to see Rubens at work in the studio prepared for him in the palace, where he not only left many original pictures, but copied for his own pleasure and profit the best of Titian's. In Spain Rubens and Velasquez met, to the delight and advantage of both.

The king now commissioned Rubens to go to London as bearer of his views to Charles I., and the painter, honoured with the title of secretary of the king's privy council in the Netherlands, arrived in London just as peace had been concluded with France. He induced Charles to engage in no undertakings against Spain so long as the negotiations remained unconcluded, and he remained immovable in this resolution. The tardiness of the Spanish court in sending a regular ambassador involved the unfortunate painter in distressing anxieties, and the tone of his despatches is very bitter. But he speaks with the greatest admiration of England. On September 23, 1630, the University of Cambridge conferred upon him the honorary degree of master of arts, and on February 21, 1630, he was knighted. During his stay in England Rubens, besides his sketches for the decoration of the Banqueting Hall at Whitehall, painted the admirable picture of "The Blessings of Peace" now in the National Gallery.

Rubens was now fifty-three years of age, he had been four years a widower, and in December 1630 he contracted a second marriage with a beautiful girl of sixteen, named Helena Fourmont. She was an admirable model, and often appears in his works.

Later Works.—Rubens's return was followed by an almost incredible activity. Inspired more than ever by the glorious works of Titian, he now produced some of his best paintings. Brightness in colouring, breadth of touch and pictorial conception, are specially striking in these later works. Could anything give a higher idea of Rubens's genius than, for example, the "Feast of Venus," the portrait of "Helena Fourmont ready to enter the Bath," or the "St. Ildefonso" in the Vienna gallery?

Isabella died in 1633, and we know that to the end Rubens remained in high favour with her, alike as an artist and as a political agent. The painter was one of the gentlemen she deputed to meet Marie de' Medici at the frontier in 1631, after her escape from France.

Ferdinand of Austria, the cardinal-infant of Spain, the new governor of the Netherlands, arrived at Antwerp in May 1635. The streets had been decorated with triumphal arches and "spectacula," arranged by Rubens. Several of the paintings detached

from the arches were offered as presents to the new governor-general, which accounts for the presence of many of these works in public galleries (Vienna, Dresden, Brussels, etc.). The painter was confirmed in his official standing. The last years of his life, however, were employed in working much more for the king than for his brother. About a hundred and twenty paintings of considerable size left Antwerp for Madrid in 1637, 1638 and 1639; they were intended to decorate the pavilion erected at the Pardo, and known under the name of Torre de la Parada. Another series had been begun, when Ferdinand wrote to Madrid that the painter was no more, and Jordaens would finish the work. Rubens breathed his last on May 30, 1640.

Rubens left the world in the midst of his glory. Not the slightest failing of mind or skill can be detected even in his latest works, such as the "Martyrdom of St. Peter" at Cologne, the "Martyrdom of St. Thomas" at Prague, or the "Judgment of Paris" at Madrid, where his young wife appears for the last time.

Rubens was a Fleming throughout, notwithstanding his frequent recollections of those Italian masters whom he most admired. But it must be borne in mind how completely his predecessors were frozen into stiffness through italianization, and how necessary it was to bring back the Flemish school to life and nature. In no other school do we find these animated hunts of lions, tigers, and even the hippopotamus and the crocodile, in which life and nature are displayed with the utmost power. "His horses are perfect in their kind," says Reynolds; his dogs are of the strong Flemish breed, and his landscapes the most charming pictures of Brabantine scenery, in the midst of which lay his seat of Steen. As a portrait painter, he shows Van Dyck the way; and his pure fancy subjects, as the "Garden of Love" (Madrid and Dresden) and the "Village Feast" (Louvre), have never been equalled.

Paintings by Rubens are found in all the principal galleries in Europe.

In America, the Metropolitan Museum of Art contains his "Return of the Holy Family from Egypt," "The Holy Family," and others; the Frick Collection, also in New York City, has his "Ambrose Spinala." The Cleveland Museum of Art contains his "Triumph of the Holy Sacrament over Folly"; the Joseph Widener Collection, Philadelphia, his "Rape of the Sabine Women"; the Detroit Institute of Arts, his "Abigail Meeting David with Presents"; and the Gardner Museum, Boston, his "Thomas Howard, Earl of Arundel."

Haberditzl, *Die Handszeichnungen von U. Rubens* (1928).

(H. Hx.; X.)

RUBIACEAE, a large family of seed plants, belonging to the series Rubiales of the subclass Sympetalae (Gamopetalae) of dicotyledons, and containing about 450 genera with about 5,500 species. It is mainly a tropical family of trees, shrubs and herbs, but some of the tribes, especially Galieae, to which the British representatives belong and which contains only herbs, are more strongly developed in temperate regions; some species of *Galium* reach the Arctic zone.

The most striking characteristic of the family are the opposite-decussate, generally entire, stipulate leaves. The stipules are very varied in form; they generally stand between the petioles of a pair of leaves (interpetiolar). The two stipules of adjacent leaves are usually united, and in the Galieae, as well shown in the British

species, are enlarged and leaf-like, forming with the two leaves an apparent whorl, by fusion or branching of the stipules the number of leaves in the whorl varies from four to eight or more. The flowers are mostly arranged in cymes or panicles or crowded into heads, and are frequently showy. The flowers are hermaphrodite and regular with parts in fours or fives; the four or five sepals, petals and stamens are placed above the ovary, which consists of two carpels and is crowned by a simple style usually ending in a head or in two lobes. The sepals are often small, sometimes reduced to a narrow ring encircling the top of the ovary or altogether absent. The united petals form a corolla which varies widely in form in the different genera; it is often funnel- or salver-shaped. The stamens are fixed to the corolla-tube and alternate in position with its segments; the flowers are often dimorphic (or heterostyled) with short-styled and long-styled forms.

The fruit also varies widely in form and is dry or fleshy. When dry it forms a capsule with septical or loculicidal dehiscence or is a schizocarp separating when dry into two one-seeded mericarps which, as in the British cleavers (*Galium aparine*), sometimes bear hooked appendages which aid their dispersal.

The family is divided into a large number of tribes based on the number of ovules in each ovary-chamber, the character of the fruit seed and ovule, and the aestivation of the corolla. These may be arranged in two classes as follows:—

Cinchonoideae, often woody plants with scale-like stipules, and numerous ovules in each ovary-chamber; the fruit is generally a capsule. To this belong *Cinchona* (q.v.), a genus of large trees with handsome flowers containing about 40 species in the Andes of South America—it is well known as a source of quinine. An allied genus, *Boerhaavia* (q.v.), is cultivated for its flowers.

Coffeoidae, often woody or shrubby plants with scale-like stipules; each ovary-chamber contains only a single ovule. *Coffea*, a genus of shrubs with about 45 species in the Old World tropics, includes the coffee plant (*C. arabica* and *C. liberica*); the fruit is a two-seeded drupe, the seed is the "coffee-bean." The thickened root of *Uragoga speciosa* yields ipecacuanha. In this class is the tribe *Stellateae*, herbaceous plants with leaf-like stipules; each ovary-chamber contains one ovule only. Includes the four British genera: *Rubia*, one species of which, *R. tinctorum*, is madder; *Galium*, including *G. verum* (lady's bedstraw), *G. aparine* (goose-grass or cleavers), and other British species; *Asperula*, including *A. odorata* (woodruff) and *Sherardia*.

The most common representatives in eastern North America are *Galium* (cleavers, goose grass, wild licorice, etc.), *Houstonia* (bluets, innocence), and *Mitchella* (partridge berry). In western North America, in addition to a few species of *Galium*, the genus *Kelloggella* is very characteristic.

RUBICON, a small stream of ancient Italy, which flowed into the Adriatic between Ariminum and Caesena, and formed the boundary between Italy and the province of Cisalpine Gaul in Republican times, while Augustus adopted the Marecchia, a few miles farther south. Hence Caesar's crossing of it in 49 B.C. meant a declaration of war against Pompey and the Senate. The historic importance of this event gave rise to the phrase "crossing the Rubicon" for a step which definitely commits a person to a given course of action. Its upper course is represented by that of the Pisciatello (called Rubigione in the 11th or 12th century and now Rugone or Urgone), and its lower portion by the Fiumicino, which the Urgone once joined. The point was marked by a station on the Via Aemilia below their confluence, 12 m. N.W. of Ariminum, bearing the name *ad Confluentes*; and here is still preserved a three-arched bridge.

RUBIDIUM, a metallic element belonging to the group of the alkali metals (symbol Rb, atomic number 37, atomic weight 85.44). It is found in the minerals lepidolite, petalite and in various specimens of mica and of carnallite, and in some mineral waters. It also occurs in tea, cocoa, coffee, tobacco and in the ashes of beetroots. It was discovered by R. Bunsen and Kirchhoff (1860) in the spectroscopic examination of the residues obtained on evaporation of water from a mineral spring at Dirckheim, being characterized by two distinctive red lines. The best source of rubidium salts is the residue left after extracting lithium salts

from lepidolite, the method of separation being based on the different solubilities of the platinumchlorides of potassium, rubidium and caesium in water. A somewhat similar process based on the varying solubilities of the corresponding alums has also been devised by Redtenbacher (1865). The metal is prepared by distilling the carbonate with carbon (an explosive compound similar to that obtained from potassium and carbon monoxide is liable to be formed simultaneously); by reducing the hydroxide with aluminium: $4\text{RbOH} + 2\text{Al} = \text{Rb}_2\text{OAl}_2\text{O}_3 + 2\text{Rb} + 2\text{H}_2$; by reducing the carbonate or the hydroxide with magnesium; and by heating the fused chloride with calcium in an exhausted glass tube at 400–500° C. The metal was first obtained electrolytically in 1910 by electrolyzing the fused hydroxide in a nickel vessel, with an iron wire cathode and iron cylinder anode; the product on cooling being opened under pyridine cooled by a freezing mixture (G. von Hevesy). It is a silvery white metal which melts at 39° C, boils at 696°, and has a specific gravity of 1.52. It oxidizes rapidly on exposure to air, and decomposes cold water very rapidly. It closely resembles caesium and potassium in its general properties. The rubidium salts are generally colourless, mostly soluble in water and crystallographically are similar to the corresponding potassium and ammonium salts, especially the latter. The acid tartrate is very sparingly soluble.

Rubidium hydride, RbH, was obtained in the form of colourless needles by H. Moissan from the direct combination of its constituent elements. It rapidly dissociates when heated *in vacuo* to 300° C. Several oxides have been described; the composition depends upon the conditions of oxidation and is doubtful in the case of Rb_2O and Rb_2O_2 , but is well substantiated for Rb_2O_3 and Rb_2O_4 . Rubidium hydroxide, RbOH, is a colourless solid which is formed by the action of rubidium on water, or by the addition of baryta water to a solution of rubidium sulphate. It is readily soluble in water, the solution being very alkaline and caustic. It melts at 301°. Evaporation of the aqueous solution at 15° C deposits a crystalline hydrated hydroxide of composition $\text{RbOH} \cdot 2\text{H}_2\text{O}$. Rubidium chloride, RbCl, is formed on burning rubidium in chlorine, or on dissolving the hydroxide in aqueous hydrochloric acid. It crystallizes in colourless cubes and volatilizes when heated very strongly. It is soluble in water and combines with many metallic chlorides to form double salts.

RUBINSTEIN, ANTON GRIGOROVICH (1829–1894), Russian pianist, born of Jewish parentage on Nov. 28, 1829 at Wechtotynetz, Podolia, was the son of a pencil manufacturer who migrated to Moscow. Besides his mother Anton had but one teacher, the piano master Alexander Villojo, of whom he declared at the end of his own career that he had never met a better. In July 1838 Rubinstein appeared in the theatre of the Petrowski Park at Moscow; and in the following years in the principal centres of Europe, including London. He then studied in Berlin and Vienna. The years 1848 to 1854 were spent in St. Petersburg in performing and composing. His opera *Dmitri Donskoi* was produced there in 1851, and *Toms der Narr* in 1853. *Die Sibirischen Jäger*, written about the same time, was not produced. In 1857 he paid his second visit to London where, at a Philharmonic concert he introduced his own concerto in G. In the following year he was in London again, having in the meantime been appointed Concert Director of the Royal Russian Musical Society. In 1862, in collaboration with Carl Schuberth, he founded the St. Petersburg Conservatorium, of which he was director until 1867, and again from 1887 to 1890. For twenty years from 1868 he made prolonged concert tours in Europe and America, enjoying prodigious success wherever he went and being accounted by some the superior even of Liszt. He died on Nov. 20, 1894. Rubinstein left compositions in almost every known form. But it is as one of the greatest of all pianists that he will be remembered.

His brother **NICHOLAS RUBINSTEIN** (1835–1881) was also a fine pianist. He founded the Moscow Conservatorium in 1864, and was its director until his death. There he founded a school of piano-playing which produced many great artists.

See Anton Rubinstein's own *Autobiography* (Eng. trans., 1890) and monographs by Bernhard Vogel, Alexander MacArthur, Eugen Zabel and Anton von Hatten, W. Baskin and U. Lisowski.

RUBRUQUIS (or RUBROUCK), **WILLIAM OF** (c. 1215-1270; fl. 1253-55), Franciscan friar, one of the chief mediaeval travellers and travel-writers. Nothing is known of him save what can be gathered from his own narrative, and from Roger Bacon, his contemporary and brother Franciscan. The name of Rubruquis ("Frater Willielmi de Rubruquis," probably meaning "of Rubrouck," Flanders) is found in the imperfect ms. printed by Hakluyt in his collection, and followed in his English translation, as well as in the complete issue of the English by Purchas. (*Itinerarium fratris Willielmi de Rubruquis de ordine fratrum Minorum*, Galli, Anno gratiae 1253, ad partes Orientales.)

Friar William went to Tartary under orders from Louis IX. (St. Louis). That king, at an earlier date, viz., December 1248, when in Cyprus, had been visited by alleged envoys from Elchigaday (Ilchikadal, Ilchikdai), who commanded the Mongol hosts in Armenia and Persia. The king then despatched a return mission consisting of Friar Andrew of Longjumeau or Lonjumeau and other ecclesiastics, who carried presents and letters for both Ilchikadal and the Great Khan. They reached the court of the latter in the winter of 1249-50, when there was no actual khan on the throne; and they returned, along with Tatar envoys, bearing a letter to Louis from the Mongol regent-mother which was couched in terms so arrogant that the king repented sorely of having sent such a mission. The envoys reached the king at Caesarea, between March 1251 and May 1252. But not long after the king, hearing that the Tatar prince Sartak, son of Batu, was a "baptized Christian," felt moved to open communication with him, and for this purpose deputed Friar William of Rubrouck. The former rebuff had made the king chary of sending formal embassies, and Friar William on every occasion, beginning with a sermon delivered in St. Sophia's on Palm Sunday (i.e., April 13) 1253, disclaimed that character.

Friar William apparently received his commission at Acre, but he travelled by way of Constantinople and there received letters to some of the Tatar chiefs from the emperor, Baldwin of Courtenay, the last of the Latin dynasty.

Rubrouck and his party landed at Solida, or Sudak, on the Crimean coast, there a centre of intercourse between the Mediterranean world and what is now S. Russia. Equipped with horses and carts for the steppe, they travelled successively to the courts (i.e., the nomad camps) of Scacatal (Kadan?), Sartak and Batu, thus crossing the Don and arriving at the Volga: of both these rivers Friar William gives vivid and interesting sketches. Batu Khan (q.v.) kept the travellers for some time in suspense, and then referred them to the Great Khan himself, an order involving the enormous journey to Mongolia. The actual travelling of the party from the Crimea to the khan's court near Karakorum cannot have been, on a rough calculation, less than 5,000 m., and the return journey to Lazajou in Cilicia would be longer by 500 to 700 m. The envoys embarked on the "Euxine" on May 7, 1253. They were at the camp of the Great Khan from Dec. 27, 1253, to about July 10, 1254. They reached Tripoli on the way home on Aug. 15, 1255.

Roger Bacon, in the geographical section of the *Opus Maius* (c. 1262), cites the traveller repeatedly and copiously, describing him as "frater Wilhelmus quem dominus rex Francie misit ad Tartaros, Anno Domini 1253 . . . qui perstravit regiones orientis et aquilonis et loca in medio his annexa, et scripsit haec praedicta illustri regi; quem librum diligenter vidi et cum eius auctore contuli." (See *Opus Maius*, Oxford edition of 1897, i. 353-66.) Add to this William's own incidental particulars as to his being—like his precursor, Friar John de Plano Carpini—a very heavy man (*ponderosus valde*), and we know no more of his personality, except the abundant indications of character afforded by the story itself. These point for us an honest, pious, stout-hearted, acute and most intelligent observer, keen in the acquisition of knowledge, the author of one of the best narratives of travel in existence. His language indeed is dog-Latin of the most un-Ciceronian quality; but it is in his hands a pithy and transparent medium of expression. In spite of all the difficulties of communication, and of the badness of his *turgemannus* or dragoman, he gathered a mass of particulars, wonderfully true or near the

truth, not only as to Asiatic nature, geography, ethnography and manners, but as to religion and language.

The narrative of Rubrouck, after Roger Bacon's copious use of it, seems to have dropped out of sight, though five mss. are still known to exist: the chief of these are (1) Corp. Chr. Coll., Cambridge, No. 66, fols. 67 v.-110 v. of about 1320; (2) No. 181 of the same library, fols. 321-98, of about 1270-90; (3) Leiden Univ. Libr., No. 77 (formerly 104), fols. 160 r.-190 r. of about 1290. It has no place in the famous collections of the 14th century. It first appeared imperfectly in Hakluyt (1598 and 1599), as we have mentioned. See the two editions in the Hakluyt Society's publications, (1) *William of Rubrouck . . . John of Pian de Carpine*, trans. and edited by William W. Rockhill (London, 1900); (2) *Texts and Versions of . . . Carpini and . . . Rubruquis . . .*, edited by C. Raymond Beazley (London, 1903). See also Beazley, *Dawn of Modern Geography*, i. 266, 278-79, 281, 298-99, 303, 320-82, 421, 440-52; iii. 17-18, 31-34, 46, 69, 84-85, 88, 98, 101, 105, 188, 330-37, 544.

RUBY, the most valued of all gem-stones, a red transparent variety of corundum, or crystallized alumina (Lat. *rubens*, red). It is sometimes termed "oriental ruby" to distinguish it from the spinel ruby, which is a stone of inferior hardness, density and value. (See SPINEL.)

The ruby crystallizes in the rhombohedral system (see CORUNDUM); the crystals have no true cleavage, but tend to break along certain gliding planes. The colour varies from deep cochineal to pale rose-red, in some cases, with a tinge of purple, the most valued tint being that called by experts pigeon's-blood colour. The oriental ruby is a mineral of very limited distribution. It most famous localities are in Upper Burma, principally in the neighbourhood of Mogoke, 90 m. N.N.E. of Mandalay. It occurs in bands of a crystalline limestone, associated with granitic and gneissose rocks, some of which are highly basic; the limestone also contains spinel, garnet, graphite, wollastonite, scapolite, feldspar, mica, pyrrhotite and other minerals. The ruby, like other kinds of corundum, suffers alteration under certain conditions, and passes by hydration into gibbsite and diaspor, which by further alteration and union with silica, etc., may yield margarite, vermiculite, chlorite and other hydrous silicates.

Rubies have been produced artificially (see GEMS, SYNTHETIC) with much success. It was once the practice to make "reconstructed rubies" by fusing together small fragments of the natural stone; but this process has given way to Prof. A. Verneuil's method of forming artificial ruby from purified ammonia-alum with a certain proportion of chrome-alum. The finely powdered material is caused to fall periodically into an oxyhydrogen flame, the heat of which decomposes the alum, and the alumina thus set free forms liquid drops which collect and solidify as a pear-shaped mass. When of the characteristic pigeon's-blood colour, the synthetic ruby contains about 2.5% of chromic oxide. The manufactured ruby possesses the physical characters of corundum, but may generally be distinguished by microscopic bubbles and striae. The manufacture of synthetic rubies is carried out commercially.

RÜCKER, SIR ARTHUR (1848-1915), English physicist, was born at Clapham on Oct. 23, 1848, and educated at Clapham grammar school and Brasenose college, Oxford. He became professor of mathematics and physics at the Yorkshire college, Leeds, in 1874, and professor of physics at the Royal College of Science in 1886. In 1901 he was appointed principal of the University of London. He was a secretary of the Royal Society from 1896 to 1901, receiving its Royal medal in 1897, and was knighted in 1902. He died at Newbury, Berks., on Nov. 1, 1915. Rücker's most important work in physics was a magnetic survey of the British Isles carried out in conjunction with Professor T. E. Thorpe; the results were published in a series of papers between 1883 and 1890. In conjunction with Professor Reinold he carried out investigations on thin liquid films; their work was published between 1877 and 1893. Rücker also made contributions to the theory of direct current dynamos and motors.

RÜDAGI (d. 954). Farid-eddin Mohammed 'Abdallah, the first great literary genius of modern Persia, was born in Rüdag, a village in Transoxiana, about 870-900. Most of his biographers assert that he was totally blind, but the accurate knowledge of colours shown in his poems makes this very doubtful. The fame

of his accomplishments reached the ear of the Sāmānid Nasr II bin Ahmad, the ruler of Khurāsān and Transoxiāna (913-42), who invited the poet to his court. Of the 1,300,000 verses attributed to Rūdāgī, there remain only 52 kasidas, ghazals and rabā'is; of his epic masterpieces we have nothing beyond a few stray lines in native dictionaries. But the most serious loss is that of his translation of Ibn Mokaḥfa's Arabic version of the old Indian fable book *Kalīlah and Dimnah*. Fragments are preserved in the Persian lexicon of Asadī of Tus (ed. P. Horn, Göttingen, 1897).

There is a complete edition of all the extant poems of Rūdāgī, in Persian text and metrical German translation in H. Ethé's "Rūdāgī der Sāmānīdendichter" (*Göttinger Nachrichten*, 1873); see also his "Neupersische Literatur" in Geiger's *Grundriss der iranischen Philologie* (ii.); P. Horn, *Gesch. der persischen Literatur* (1901), p. 73; E. G. Browne, *Literary History of Persia*, i. (1905); C. J. Pickering, "A Persian Chaucer" in *National Review* (May 1890).

RUDD (*Scardinius erythrophthalmus*), a Cyprinid fish of Europe and western and northern Asia, deep-bodied, with reddish fins, and with the dorsal fin farther back than in the roach. It reaches a length of 18 in. and a weight of 3½ lb. It is called pearl roach in the United States where it has been introduced.

RUDDER, that part of the steering apparatus of a ship which is fastened to the stern outside, and on which the water acts directly (O.E. *Rothar*, i.e., rower). The word may be found to be used as if it were synonymous with "helm." But the helm (A.S. *Hilf*, a handle) is the handle by which the rudder is worked. The tiller, which is perhaps derived from a provincial English name for the handle of a spade, has the same meaning as the helm. In the earliest times a single oar, at the stern, was used to row the vessel round. In later times oars with large blades were fixed on the sides near the stern. In Greek and Roman vessels two sets were sometimes employed, so that if the pitching of the ship lifted the after pair out of the water, the foremost pair could still act. As these ancient ships were, at least in some cases, sharp at both ends and could sail either way, steer (or steering) oars were fixed both fore and aft. The steer oar in this form passed through a ring on the side and was supported on a crutch, and was turned by a helm, or tiller. Norse and mediæval vessels had, as far as we can judge, one steer oar only placed on the right side near the stern—hence the name "starboard," i.e., steerside, for the right side of the ship looking forward. In the case of small vessels the steer oar possesses an advantage over the rudder, for it can bring the stern round quickly. Therefore it is still used in whaling boats and rowing boats which have to work against wind and tide, and in surf when the rudder will not act. The side rudder was generally displaced by the stern rudder in the 14th century. (See *SHIPBUILDING*.)

RÜDESHEIM, a town in the Prussian province of Hesse-Nassau, Germany, 19 mi. S.W. of Wiesbaden. Pop. (1933) 4,740. It lies at the lower end of the vineyard district of the Rheingau, opposite Bingen and just above the gorge of the Rhine, and is a popular tourist centre. Rüdesheim has some interesting towers: the Brömserburg, or Niederburg (13th century), formerly belonging to the archbishops of Mainz; the Boosenburg, or Oberburg; the Adlerturn, a relic of the fortifications of the town; and the Vorderburg, the remains of an old castle.

RUDINĀ, ANTONIO STARABBA, MARQUIS DI (1839-1908), Italian statesman, born at Palermo on April 6, 1839, joined the revolutionary committee in 1859. After spending a short time at Turin as attaché to the Italian foreign office he was elected mayor of Palermo. In 1866 he quelled a separatist insurrection. He was then appointed prefect of Palermo, and put down brigandage throughout the province; in 1868 he was prefect of Naples. In October 1869 he became minister of the interior in the short-lived Menabrea cabinet. On the death of Minghetti in 1886, he became leader of the Right. Early in 1891 he succeeded Crispi in 1891 as premier and minister of foreign affairs by forming a coalition cabinet with a part of the Left under Nicotera; his administration initiated the economies by which Italian finances were put on a sound basis, and also renewed the Triple Alliance. He was overthrown in May 1892 by a vote of the Chamber and succeeded by Giolitti. Upon the return of his rival, Crispi, to power in December 1893, he

resumed political activity, allying himself with the Radical leader, Cavallotti. The crisis consequent upon the disaster of Adowa (March 1, 1896) brought Rudinā back to power as premier and minister of the interior in a cabinet formed by the veteran Conservative, General Ricotti. He concluded peace with Abyssinia, but endangered relations with Great Britain by the unauthorized publication of confidential diplomatic correspondence in a Green-book on Abyssinian affairs. To satisfy the anti-colonial party he ceded Kassala to Great Britain, provoking thereby much indignation in Italy. He was overthrown in June 1898. His conduct of affairs had gravely divided his party. He died on Aug. 6, 1908, leaving a son, Carlo, who married a daughter of Henry Labouchère.

RUDOLF (otherwise known as BASSO NOROK and GALLOP), a large lake of eastern equatorial Africa, forming the centre of an inland drainage system, occupying the south of the Abyssinian highlands and a portion of the great equatorial plateau. The lake itself lies towards the north of the great East African rift valley, between 2° 26' and 5° N, while the meridian of 36° E. passes through the lake. The lake is in part in Uganda, in Kenya, in Abyssinia and in Anglo-Egyptian Sudan. The length along the curved axis is 185 mi., the maximum width 37 mi. Its altitude is 1,250 ft. Towards the south it is deep, but comparatively shallow in the north. Its water is brackish, but drinkable. The country bordering the lake on almost every side is composed of Archaean metamorphic rock and is sterile and forbidding. The southern end is shut in by high cliffs—the escarpments of a rugged lava-strewn country, which shows abundant signs of volcanic activity. In particular, the great Teletki volcano stands at the southern end of the lake. The highest point of the south-east side of the lake is Mt. Kulal, 7,812 ft., while the culminating height within the basin of the lake is Mt. Sil, 9,280 ft., which lies about 20 mi. south of Lubbura. Farther north, on the west side, sandy plains alternate with lines of low hills. Lagoons cut off from the lake are the haunt of great numbers of water-birds. In 3° 8' N. the dry bed of the Turkwell approaches the lake. Near the northern end mountains again approach the shores, the most prominent being Mt. Lubur (3,200 ft.), an extinct volcano with a well-preserved crater. At the extreme north-west a bay some 35 mi. long (Sanderson gulf) is almost separated from the rest of the lake by two long points of land. On the east side, open arid plains, with few trees, occupy most of the north country. One hill, in 3° 20' N., has a height of 3,470 ft., and at the north-east end, separating the lake from Lake Stefanie, is a hilly country, the highest point between the lakes being 3,524 ft. Immediately north of these hills rises the Hummurr range, with one peak exceeding 7,000 ft. Near the south end is the volcanic island of Elmolio, 10 mi. long, and there are a few small islets. Just north of 4° N. is a small volcanic island with highest point 2,100 ft. At the north end of the lake a level swampy plain is traversed by various arms of the lake and by the Nianam river (identical with the Omo). Lake Rudolf was discovered in 1888 by Count Samuel Teleki and Lieutenant Ludwig von Höhnel.

RUDOLPH II. (1552-1612), Roman emperor, son of the emperor Maximilian II. by his wife Maria, daughter of the emperor Charles V. was born in Vienna on July 18, 1552. In 1563 he was sent to Spain, where he was educated. In 1572 he was crowned king of Hungary, in 1575 king of Bohemia; and in Oct. 1575 he was chosen German king, at Regensburg, becoming emperor on his father's death in Oct. 1576.

The more active part of the emperor's life was the period from his accession to about 1597. During that time he attended the infrequent imperial diets, and took an interest in the struggle in the Netherlands and the defence of the empire against the Turks. He was at times suspicious of the papal policy, while his relations with Spain were somewhat inharmonious. He forwarded the progress of the counter-reformation, and in general the tolerant

policy of Maximilian II. was reversed. Political as well as religious privileges were attacked; and discontent became very pronounced about the opening of the 17th century. Meanwhile Rudolph had become increasingly subject to attacks of depression, which bordered on insanity. In 1604, after a war with Turkey had been in progress since 1593, many of the Hungarians rebelled against Rudolph and chose Stephen Bocskay as their prince. In April 1606 the Habsburg family declared Rudolph incapable of ruling, and recognized one of his younger brothers, the archduke Matthias, afterwards emperor, as their head; and in the following June Matthias, having taken over the conduct of affairs, made peace by granting extensive concessions to the rebellious Hungarians, and concluded a treaty with the sultan in November of the same year. Then shaking off his lethargy Rudolph prepared to renew the war with the Turks, a move which Matthias met by throwing himself upon the support of the national party in Hungary. Matthias also found adherents in other parts of his brother's dominions, with the result that in June 1608 the emperor was compelled to cede to him the kingdom of Hungary together with the government of Austria and Moravia. Rudolph now sought the aid of the princes of the empire, and even of the Protestants; but he had met with no success in this direction when trouble arose in Bohemia. Having at first rejected the demand of the Bohemians for greater religious liberty, the emperor was soon obliged to yield to superior force, and in 1609 he acceded to the popular wishes by issuing the Letter of Majesty (*Majestätsbrief*), and then made similar concessions to his subjects in Silesia and elsewhere. A short reconciliation with Matthias was followed by further disorder in Bohemia, which was invaded by Rudolph's cousin, the archduke Leopold (1586-1632). The Bohemians invoked the aid of Matthias, who gathered an army; and in 1611 the emperor, practically a prisoner at Prague, was again forced to cede a kingdom to his brother. Rudolph died at Prague, his usual place of residence, on Jan. 20, 1612, and was succeeded as emperor by Matthias.

Rudolph was greatly interested in chemistry, alchemy, astronomy and astrology; he was a patron of Tycho Brahe and Kepler, and was himself something of a scholar and an artist. He was the greatest collector of his age, his agents ransacking Europe to fill his museums with rare works of art. His education at the Spanish court and an hereditary tendency to insanity, however, made him haughty, suspicious and consequently very unpopular.

The sources for the life and times of Rudolph II. are somewhat scanty, as many of the official documents of the reign, which were kept at Prague and not at Vienna, were destroyed, probably during the Thirty Years' War. The best authorities, however, are: *Rudolph II. epistolae ineditae*, edited by B. Comte de Pace (Vienna, 1771); M. Ritter, *Quellenbeiträge zur Geschichte des Kaisers Rudolph II.* (Munich, 1872); and *Deutsche Geschichte im Zeitalter der Gegenreformation und des dreissigjährigen Krieges* (Stuttgart, 1887 fol.); L. von Ranke, *Zur deutschen Geschichte: Vom Religionsfrieden bis zum 30-jährigen Kriege* (Leipzig, 1868); A. Gindely, *Rudolph II. und seine Zeit* (Prague, 1862-68); F. Strle, *Die Verhandlungen über die Nachfolge Kaiser Rudolph II.* (Munich, 1880); in *Die Allgemeine Deutsche Biographie*, Band x. (Leipzig, 1880); and *Der Ursprung des dreissigjährigen Krieges* (Munich, 1875); F. von Bezold, *Kaiser Rudolph II. und die heilige Liga* (Munich, 1886); J. Janssen, *Geschichte des Deutschen Volks seit dem Ausgang des Mittelalters* (Freiburg, 1878 fol.); of which there is an English translation by M. A. Mitchell and A. M. Christie (1896 fol.); and H. Moritz, *Die Wahl Rudolphs II.* (Marburg, 1895).

RUDOLPH or **RAOUL** (d. 936), king of the Franks and duke of Burgundy, was a son of Richard duke of Burgundy, and was probably a member of the Carolingian family. He succeeded his father in 921, married Emma, daughter of Robert duke of the Franks, and assisted his father-in-law to drive the Frankish king, Charles III. (the Simple), from his throne. Robert then became king of the Franks, but was killed in battle in June 923 and was succeeded by Rudolph. At Limoges Rudolph defeated the Normans, the Aquitanians and Herbert of Vermandois. Rudolph died at Auxerre, leaving no sons, on Jan. 14, 936.

See *Wahl, König Rudolph von Frankreich* (Leipzig, 1886).

RUDOLPH (d. 1080), German king, and duke of Swabia, was a son of Kuno, count of Rheinfelden, who possessed estates in both Burgundy and Swabia. He received the duchy of Swabia

from Agnes, regent and mother of the young king, Henry IV., in 1057, and two years later married the king's sister Matilda, and was made administrator of the kingdom of Burgundy. When Henry was excommunicated and deposed by Pope Gregory VII., the princes met at Forchheim, and elected Rudolph as German king. He renounced the right of investiture, disclaimed any intention of making the crown hereditary in his family, and was crowned at Mainz, on March 27, 1077. He found no support in Swabia, but, uniting with the Saxons, won two victories over Henry's troops, and, in 1080, was recognized by the pope. On Oct. 15, 1080, Rudolph was severely wounded at Hohenmölsen, and died the next day. He was buried at Merseburg, where his beautiful bronze tomb is still to be seen.

See O. Grund, *Die Wahl Rudolphs von Rheinfelden zum Gegenkönig* (Leipzig, 1880).

RUDOLPH I. (1218-1291), German king, son of Albert IV. count of Habsburg, and Hedwig, daughter of Ulrich count of Kyburg, was born at Limburg, on May 1, 1218. At his father's death in 1239 Rudolph inherited the family estates in Alsace, and in 1245 married Gertrude, daughter of Burkhard III. count of Hohenberg. A partisan of the emperor Frederick II. and his son Conrad IV., he was richly rewarded by them, but in 1254 was excommunicated by Pope Innocent IV. In the general disorder after the fall of the Hohenstaufens, he increased his estates largely at the expense of his uncle, Hartmann of Kyburg, and the bishops of Strassburg and Basle, becoming the most powerful prince in south-western Germany. His election as German king at Frankfurt (Sept. 29, 1273) was largely due to the efforts of his brother-in-law, Frederick III. of Hohenzollern, burgrave of Nuremberg. The support of Albert duke of Saxe-Lauenburg, and of Louis II. count palatine of the Rhine and duke of upper Bavaria, had been purchased by betrothing them to two of Rudolph's daughters; so that Ottakar II. king of Bohemia, a candidate for the throne, was almost alone in his opposition. Rudolph was crowned at Aix-la-Chapelle on Oct. 24, 1273. To win the approbation of the pope Rudolph renounced all imperial rights in Rome, the papal territory and Sicily, and promised to lead a new crusade; and Pope Gregory X., in spite of Ottakar's protests, not only recognized Rudolph himself, but persuaded Alphonso X. king of Castile, who had been chosen German king in 1257, to do the same. From 1274-78 Rudolph was engaged in an intermittent struggle with Ottakar, which ended with the latter's death. (See AUSTRIA, EMPIRE OF.) Rudolph then set about consolidating his authority in Austria and the adjacent countries, where he met much opposition. At length in Dec. 1284 Rudolph invested his sons Albert and Rudolph with the duchies of Austria and Styria at Augsburg, and so laid the foundations of the greatness of the house of Habsburg.

In 1281 Rudolph compelled Philip I. count of upper Burgundy to cede some districts to him, forced the citizens of Berne to pay tribute, and in 1289 marched against Philip's successor, Otto IV., and compelled him to do homage. He was much less successful, however, in maintaining order in Germany, although in 1289 he led an expedition into Thuringia and destroyed some robber castles. In 1281 his first wife died, and on Feb. 5, 1284 he married Isabella, daughter of Hugh IV. duke of Burgundy. In 1291 he attempted to secure the election of his son Albert as German king; but without success, although Albert, the only son who survived him, was crowned German king after Rudolph's death. Rudolph died at Spire on July 15, 1291 and was buried in the cathedral of that city. His reign is memorable rather for the house of Habsburg than for the kingdom of Germany.

See K. Hagen, *Deutsche Geschichte von Rudolf von Habsburg bis auf die neueste Zeit* (Frankfurt, 1854-57); O. Lorenz, *Geschichte Rudolphs von Habsburg und Adolfs von Nassau* (Vienna, 1865-67); A. Huber, *Rudolf von Habsburg vor seiner Thronbesteigung* (Vienna, 1871); J. Hirn, *Rudolf von Habsburg* (Vienna, 1874); H. von Zeissberg, *Ueber das Rechtsverhältniss Rudolph von Habsburg gegen Ottakar von Böhmen* (Vienna, 1882); H. Otto, *Die Beziehungen Rudolphs von Habsburg zu Papst Gregor X.* (Erlangen, 1893); A. Busson, *Der Krieg von 1278 und die Schlacht bei Dürnitz* (Vienna, 1880); and G. Redlich, *Rudolf von Habsburg* (Innsbruck, 1903). See also GERMANY; AUSTRIA; EMPIRE OF; HABSBURG.

RUDOLPH or **RAOUL**, known as **RUDOLPH GLABER** (Rudolph the Bald) (d. c. 1050), French chronicler, was born in Burgundy

about 985, and was in turn an inmate of the monasteries of St. Leger at Chamepeaux and St. Bénigne at Dijon, afterward entering the abbey of Cluny, and becoming a monk at St. Germain at Auxerre before 1039. He also appears to have visited Italy. His *Historiarum sui temporis libri V*, dedicated to St. Odilon, abbot of Cluny, purports to be a universal history from 900 to 1044; but is an irregular narration of events in France and Burgundy.

The *Historiarum* was first printed in 1506, and published by A. Duchesne in the *Historie Francorum Scriptores*, tome iv (1639-49). Extracts are printed in the *Monumenta Germaniae historica*, Band vii; but perhaps the best edition of the work is the one edited by M. Frou in the *Collection de textes pour servir à l'étude et l'enseignement de l'histoire* (1886). Rudolph also wrote a *Vita S. Guilielmi, abbatis S. Benigni*, published by J. Mabillon in the *Acta Sanctorum*, tome vi (1668).

See A. Molinier, *Les Sources de l'histoire de France*, tome ii (Paris, 1902); and A. Poithast, *Bibliotheca historica* (Berlin, 1896).

RUDOLPH OF HABSURG (1858-1889), crown prince of Austria, was born on Aug. 21, 1858, the only son of the emperor Francis Joseph I of Austria (q.v.) and his wife Elizabeth. Great hopes centred on the boy, who possessed unusual talents. Although his father was chiefly intent on his military education, Rudolph's own chief interests were natural history and literature. The monumental description of the Austro-Hungarian monarchy, *Oesterreich-Ungarn in Wort und Bild*, was truly his conception and in part his work; he also wrote some minor works of his own. He early developed an interest in modern literature and thought; became known as a freethinker, and even a revolutionary, and made no secret of his anticlerical views. He thus drifted into increasing opposition to his father, which was accentuated by his notoriously easy morality. His marriage with Stephanie, daughter of the king of the Belgians, took place on May 10, 1881, and was at first happy, although its only fruit—unfortunately for the Austrian succession—was one daughter, Elizabeth (afterward Princess Windischgrätz). Later he developed a deep passion for the young and beautiful Baroness Marie Vetsera, and on Jan. 30, 1889, the sudden and appalling news reached Vienna that the bodies of the two lovers had been found in Rudolph's hunting lodge of Mayerling, near Vienna. It was at once officially announced that the pair had committed suicide. All persons in any way connected with the story were sworn to secrecy, and the official dossier was excluded from the state archives. Numerous extraordinary rumours naturally arose, connecting the death with the Jesuits, the Hungarian nobles, or an injured husband; but it is generally accepted that the crown prince actually shot his lover, and afterward committed suicide in a fit of despair, partly due to his father's order to break off the liaison. (C. A. M.)

RUDOLSTADT, a town of Germany, in the Land of Thuringia, on the left bank of the Saale, 18 mi. S.W. of Jena, by the railway to Saalfeld. Pop. (1939) 19,471. The name of Rudolstadt occurs in an inventory of the possessions of the abbey of Hersfeld in the year 800. After passing under various rulers, it came into the hands of the counts of Schwarzburg in 1335. Its civic rights were confirmed in 1404, and from 1599 it was the residence of the ruling house of Schwarzburg-Rudolstadt. The town is a favourite tourist resort. The former residence of the prince is the Heidecksburg, a palace which was rebuilt after a fire in 1735 on an eminence 200 ft. above the Saale. The Ludwigsburg is another palace in the town built in 1742. The town also has a hydropathic establishment. The industries of the place include the manufacture of porcelain, chemicals, machinery, dyestuffs and thermos flasks.

RUDRA, a minor god in Vedic India who doubtless personified lightning (the "red" one, probably), but also protected cattle against it. In the *Rig Veda* he is identified with Agni (q.v.), but in the later *Vedas* he is called an archer and his malevolence emphasized. Best known as father of the storm-gods (Maruts, q.v.), in the Epic period he becomes many Rudras and in modern Hinduism is identified with Siva (q.v.).

RUE, the name of a woody or bushy herb, belonging to the genus *Ruta* (family Rutaceae), especially *R. graveolens*, the "common rue," a plant with bluish green spotted leaves and greenish

yellow flowers, native to Europe and sparingly naturalized in eastern North America. It has a strong pungent smell and the leaves have a bitter taste. The plant was much used in mediaeval and later medicine as a stimulative and irritant drug. It was commonly supposed to be much used by witches. From its association with "rue" (sorrow, repentance), the plant was also known as "herb of grace," and was taken as the symbol of repentance.

RUEDA, LOPE DE (1510?-1565), Spanish dramatist, was born at Seville, where, according to Cervantes, he worked as a metal beater. His name first occurs in 1554 as acting at Benavente, and between 1558 and 1561 he was manager of a strolling company. Rueda's more ambitious plays, such as *Enfuenia*, *Armelina* and *Los Enfadados*, are mostly adapted from the Italian. They follow the original so closely that they give no idea of his talent; but in his *pasos* or prose interludes he displays an abundance of riotous humour, great knowledge of low life, and a most happy gift of dialogue. Rueda, with his strollers, created a taste for the drama which he was able to gratify, and he is admitted by both Cervantes and Lope de Vega to be the true founder of the national theatre.

RUEIL-MAIMAISON, a town of north France, in the department of Seine-et-Oise, at the west foot of Mt. Valérien, 6 mi. W. of Paris. Pop. (1936) 18,565. Rueil has a church rebuilt by Napoleon III in the original Renaissance style and containing the tombs of the Empress Josephine and her daughter Hortense de Beauharnais. Rueil has important photographic works and manufactures of lime and cement, etc. Close to the town is the 18th century château of Malmaison, the residence of the Empress Josephine.

RUFFA: see ARABS.

RUFF, a limicoline bird, taking its name from the frill of elongated feathers round the neck of the breeding male, to which the name is properly confined; the female, a much smaller bird, is termed the reeve. The plumage of the male is extremely variable, but the same markings are reproduced after every moult in each individual bird. The ruff (*Macates pugnax*) no longer breeds in Britain, but its range extends across the whole of N. Europe and Asia, and it migrates south to India, Ceylon and Africa in winter. Except for its remarkable frill and its polygamous habit, the ruff does not differ in any marked manner from the ordinary sandpipers.

The extraordinary courtship antics of the cock bird are described in Montagu's *Ornithological Dictionary*, Stevenson's *Birds of Norfolk*, Selous' *Realities of Bird Life* (Constable & Co., London, 1926), and elsewhere.

The nest is made on the ground and, as in almost all polygamous animals, the male takes no interest in his offspring.

RUFFO, FABRIZIO (1744-1827), Neapolitan cardinal and politician, was born at San Lucido, Calabria, on Sept. 16, 1744. His father, Litterio Ruffo, was duke of Baranello, and his mother, Giustiniana, was a Colonna. Ruffo was placed by pope Pius VI among the *chierici di camera*—the clerks who formed the papal civil and financial service. He was later promoted to be treasurer-general, a post which carried with it the ministry of war. In 1791 he was removed from the treasury, but was created cardinal on Sept. 29, though he was not in orders. He never became a priest. Ruffo went to Naples, and, when in Dec. 1798 the French troops advanced on Naples, he accompanied the royal family to Palermo. He was chosen to head a royalist movement in Calabria, where his family exercised large feudal powers. He was named vicar-general on Jan. 25, 1799. On Feb. 8, he landed at La Cortona with a small following, and began to raise the so-called "army of the faith" in association with Fra Diavolo.

Ruffo had no difficulty in upsetting the republican government established by the French and by June had advanced to Naples. (See NAPLES, KINGDOM OF and NELSON, HORATIO NELSON.) But he lost favour with the king by showing a tendency to spare the republicans. He resigned his vicar-generalship to the prince of Cassaro, and during the second French conquest and the reigns of Joseph Bonaparte and Joachim Murat he lived quietly in Naples. During the revolutionary troubles of 1822 he was consulted by the king, and was even in office for a very short time as a "loyalist" minister. He died on Dec. 13, 1827.

The account of Ruffio given in Colletta's *History of Naples* (English trans., Edinburgh, 1860) is biased. Cf. the duca de Lauria, *Intorno alla storia del Reame di Napoli di Pietro Colletta* (Naples, 1877). Ruffio's own side of the question is stated in *Memorie storiche sulla vita del Cardinale Fabrizio Ruffio*, by Domenico Sacchinelli (Naples, 1836). See also Baron von Hellert, *Fabrizio Ruffio: Revolution and Revolution von Neapel* (Vienna, 1882).

RUFIIJ, a large river of Tanganyika Territory, East Africa, entering the sea by a delta, between 7° 45' and 8° 13' S. Its upper basin is drained by three main branches, of which the two southern, the Luwegu and the Ulanga, though shorter than the northernmost (the Ruaha), carry more water, as they come from a more rainy region, and by their junction in 8° 35' S., 37° 25' E., the Rufiji proper may be said to be formed.

The Luwegu rises 10° 50' S., 35° 50' E., and flows in a narrow wooded valley and in its lower course it is 100 to 150 yd. wide. The Ulanga is formed by a number of streams descending from the escarpment which runs north-east from Lake Nyasa and in Uhehe becomes broken up in ranges of mountains. The most important head-stream is the Ruhuje. As a whole, the Ulanga valley is broad, level and swampy, the meandering river sending off many diverging arms. It is navigable throughout the greater part of its course, having in the dry season a general depth of 3 to 12 ft., with a width of 40 to 120 yd. In April and May nearly all the streams overflow their banks. Below the junction of the Luwegu and Ulanga, the Rufiji flows through a narrow pass by the Shuguli falls, and continues to the junction of the Ruaha, in 4° 55' S., 37° 52' E. The most remote branches of the Ruaha rise in the Livingstone Mountains. The united stream sweeps round the N. of the Uhehe Mountains, finally flowing to the Rufiji. Below the junction the Rufiji is broken by the Pangani falls, but is thence navigable by small steamers to its delta, receiving no large tributaries but sending out divergent channels. The country on either side is a generally level plain, inundated, on the south, in the rains, and the river varies in width from 100 to 400 yd. The main mouth of the river is that known as Simba Uranga, the bar of which can be crossed by ocean vessels at high water, but all the branches are very shallow as the apex of the delta is approached. Much of the delta is suited for rice-growing. (For geology see TANGANYIKA TERRITORY.)

RUFINUS, TYRANNIUS, presbyter and theologian, was born at or near Aquileia at the head of the Adriatic, probably between 340 and 345. In early manhood he entered the cloister as a catechumen, receiving baptism about 370. About the same time a visit of Jerome to Aquileia led to a close friendship between the two, and shortly after Jerome's departure for the East Rufinus also was drawn thither (in 372 or 373) by his interest in its theology and monasticism. He first settled in Egypt. There, if not even before leaving Italy, he had become intimately acquainted with Melania, a wealthy and devout Roman widow; and when she removed to Palestine, taking with her a number of clergy and monks on whom the persecutions of the Arian Valens had borne heavily, Rufinus (about 378) followed her. While his patroness lived in a convent of her own in Jerusalem, Rufinus, at her expense, gathered together a number of monks in a monastery on the Mount of Olives, devoting himself at the same time to the study of Greek theology. When Jerome came to Bethlehem in 386, the friendship formed at Aquileia was renewed. Another of the intimates of Rufinus was John, bishop of Jerusalem, and formerly a Nitrian monk, by whom he was ordained to the priesthood in 390. In 394, in consequence of the attack upon the doctrines of Origen made by Epiphanius of Salamis during a visit to Jerusalem, a fierce quarrel broke out, which found Rufinus and Jerome on different sides; and, though three years afterwards Jerome and John were reconciled, the breach between Jerome and Rufinus remained unhealed.

In the autumn of 397 Rufinus embarked for Rome, where he published a Latin translation of the *Apology* of Pamphilus for Origen, and also (398–99) a somewhat free rendering of the *πρὸς ὑπερβολὴν* (or *De Principiis*) of that author himself. In the preface to the latter work he referred to Jerome as an admirer of Origen, and as having already translated some of his works with modifications of ambiguous doctrinal expressions. This led

to a bitter dispute between Jerome and Rufinus. At the instigation of Theophilus of Alexandria, Anastasius (pope 398–402) summoned Rufinus from Aquileia to Rome to vindicate his orthodoxy; but he excused himself from a personal attendance in a written *Apologia pro fide sua*. The pope in his reply expressly condemned Origen, but left the question of Rufinus's orthodoxy to his own conscience. He was, however, regarded with suspicion in orthodox circles (cf. the *Decretum Gelasii*, § 20) in spite of his services to Christian literature. In 408 we find Rufinus at the monastery of Pinetum (in the Campagna?); thence he was driven by the arrival of Alaric to Sicily, being accompanied by Melania in his flight. In Sicily he was engaged in translating the *Homilies* of Origen when he died in 410.

The original works of Rufinus are—(1) *De Adulatione Librorum Origenis*—an appendix to his translation of the *Apology* of Pamphilus, and intended to show that many of the features in Origen's teaching which were then held to be objectionable arise from interpolations and fabrications of the genuine text; (2) *De Benedictinibus XII. Patrum*; (3) *Inventorium in Hieronymum Libri II.*; (4) *Apologia pro fide sua ad Anastasium Pontificem*; (5) *Historia Eremitica*—consisting of the lives of thirty-three monks of the Nitrian desert; (6) *Expositio Symboli*, a commentary on the creed of Aquileia comparing it with that of Rome, which is valuable for its evidence as to church teaching in the 4th century. The *Historia Ecclesiastica Libri XI.* of Rufinus consist partly of a free translation of Eusebius (10 books in 9) and partly of a continuation (bks. x. and xi.) down to the death of Theodosius the Great.

See W. H. Fremantle in *Dict. Chr. Biog.* iv. 555–60; A. Ebert, *Allg. Gesch. d. Lit. d. Mittelalters im Abendlande*, i. 321–27 (Leipzig, 1880); G. Krüger in Herzog-Hauck's *Realencyclop. für prot. Theol.*, where there is a full bibliography.

RUFUS, LUCIUS VARIUS (c. 74–14 B.C.), Roman poet of the Augustan age. He was the friend of Virgil, after whose death he and Plotius Tucca prepared the *Aeneid* for publication, and of Horace, for whom he and Virgil obtained an introduction to Maecenas. Horace and Virgil speak highly of his epic poetry. From Macrobius (*Saturnalia*, vi. 1, 39; 2, 79) we learn that Varius composed an epic poem *De Morte*, some lines of which are quoted as having been imitated or appropriated by Virgil. But his most famous literary production was the tragedy *Thyestes*, which Quintilian (*Inst. Orat.* x. 1, 98) declares equal to any of the Greek tragedies. It was presented at the games of 29 B.C.

Fragments in E. Bährens, *Frag. Poetarum Romanorum* (1886); monographs by A. Weichert (1856) and R. Unger (1870, 1878, 1898); M. Schanz, *Geschichte der römischen Literatur* (1890), ii. 1; Teuffel, *Hist. of Roman Literature* (Eng. trans., 1900), 223.

RUGBY, a municipal borough in the Rugby parliamentary division of Warwickshire, England, on a tableland rising from the south bank of the Avon, near the Oxford canal. Pop. (1938) 38,130. Area, 11 sq.mi. It is 82½ mi. N.W. from London by the L.M.S.R., and is also served by the L.N.E.R. Rugby (Rochester, Rokeby) was originally a hamlet of the adjoining parish of Clifton-upon-Dunsmore, and is separately treated as such in Domesday. In the reign of Henry III it became a separate parish, and the same king granted the town a weekly market and a yearly fair. Cromwell was quartered there in 1645, and William III passed through on his way to Ireland. The town was not of great importance until the 19th century, its rise being mainly due to the advent of railways. It is an important junction on the L.M.S.R. and has large engineering and electrical works. From 1894 to 1932, when it was incorporated, Rugby was governed by an urban district council. The boys' school, ranking as one of the first public schools in England, was founded and endowed under the will (1567) of Laurence Sheriff of Rugby. The endowment consisted of the parsonage of Broomfield, Sheriff's mansion house in Rugby and one-third (8 ac.) of his estate in Middlesex, which, being let on building leases, gradually increased to about £5,000 a year. The full endowment was obtained in 1653. The school originally stood opposite the parish church, and was removed to its present site on the south side of the town between 1740 and 1750. In 1809 it was rebuilt from designs by Henry Hakewill (1771–1830); the chapel, dedicated to St. Lawrence, was added in 1820. The chapel was rebuilt and reconsecrated in 1872, and additions were

On this work see Dom Butler in *Texts and Studies*, vi. i. pp. 20 ff.

made in 1898. The Temple observatory, containing a fine equatorial refractor by Alvan Clark, was built in 1877, and the Temple reading-room with the art museum in 1878. The workshops underneath the gymnasium were opened in 1880, and a new big school and class-rooms were erected in 1885. Later additions include the science school (1914), enlarged in 1940.

RUGE, ARNOLD (1802–1880), German philosopher and political writer, was born at Bergen, on the island of Rügen, on Sept. 13, 1802. He studied at Halle, Jena and Heidelberg, and became an adherent of the party which sought to create a free and united Germany. For his zeal he was confined for five years in the fortress of Kolberg, where he studied Plato and the Greek poets. On his release in 1830 he published *Schill und die Seinen*, a tragedy, and a translation of *Oedipus in Colonus*. Ruge settled in Halle, where in 1837 with E. T. Eichermeyer he founded the *Halleische Jahrbücher für deutsche Kunst und Wissenschaft*. In this periodical he discussed the questions of the time from the point of view of the Hegelian philosophy. The *Jahrbücher* was detested by the orthodox party in Prussia; and was finally suppressed by the Saxon government in 1843. In Paris Ruge tried to act with Karl Marx as co-editor of the *Deutsch-Französische Jahrbücher*, but had little sympathy with Marx's socialistic theories, and soon left him.

In the revolutionary movement of 1848 he organized the Extreme Left in the Frankfurt parliament, and for some time lived in Berlin as the editor of *Die Reform*. The Prussian government intervened and Ruge soon afterwards left for Paris, hoping, through his friend Alexandre Ledru-Rollin, to establish relations between German and French republicans; but in 1849 both Ledru-Rollin and Ruge had to take refuge in London. Here, in company with Giuseppe Mazzini and other advanced politicians, they formed a "European Democratic Committee." From this Ruge soon withdrew, and in 1850 went to Brighton, where he supported himself by teaching and writing. In 1866 and 1870 he vigorously supported Prussia against Austria, and Germany against France. In his last years he received from the German government a pension of 1,000 marks. He died on Dec. 31, 1880. After the publication of his *Gesammelte Schriften* (10 vols., 1846–48) he wrote, among other books, *Unser System, Revolutionsnovellen, Die Lage des Humanismus, and Aus früherer Zeit* (his memoirs). His *Letters and Diary* (1825–80) were published by Paul Nerlich (1885–87).

RUGELEY, market town, urban district, Lichfield parliamentary division of Staffordshire, England, in the Trent valley 1234 mi. N.W. of London on the L.M.S.R. and on the Grand Trunk canal. Pop. (1938) 7,504; area 4.5 sq. mi. To the S.W. is Cannock Chase. A grammar school was founded in 1611. There are iron foundries, corn-mills and tanneries; the parish has several collieries. The urban district included Brereton after 1934.

RÜGEN, an island of Germany, in the Baltic, immediately opposite Stralsund, 14 mi. off the northwest coast of Pomerania in Prussia, from which it is separated by the narrow Strelasund, or Bodden. Its shape is exceedingly irregular, and its coast line is broken by numerous bays and peninsulas, sometimes of considerable size. The general name is applied by the natives only to the roughly triangular main trunk of the island, while the larger peninsulas, the landward extremities of which taper to narrow necks of land, are considered to be as distinct from Rügen as the various adjacent smaller islands which are also included for statistical purposes under the name. The chief peninsulas are those of Jasmund and Wittow on the north, and Mönchgut, at one time the property of the monastery of Eldena, on the southeast; and the chief neighbouring islands are Ummanz and Hiddensee, both off the northwest coast. Rügen is the largest island in Germany. Its greatest length from north to south is 32 mi.; its greatest breadth is 25½ mi.; and its area is 377 sq. mi. The surface gradually rises towards the west to Rugard (335 ft.)—the "eye of Rügen"—near Bergen, but the highest point is the Herthaub (505 ft.) in Jasmund. Erratic blocks are scattered throughout the island, and the roads are made with granite. The most beautiful and attractive part of the island is the peninsula of Jasmund, which terminates to the north in the Stubbenkammer

(Slavonic for "rock steps"), a sheer chalk cliff, the summit of which, the Königsstuhl, is 420 ft. above the sea. The east of Jasmund is clothed with an extensive beech wood called the Strubbenitz, in which lies the Borg, or Hertha lake. Connected with Jasmund by the narrow isthmus of Schabe to the west is the peninsula of Wittow, the most fertile part of the island. At its northwest extremity rises the height of Arcona, with a lighthouse.

A ferry connects the island with Stralsund, and from the landing stage at Altefähr a railway traverses the island, passing the capital Bergen to Sassnitz, on the northeast coast. The other chief places are Garz, Sagard, Gingst and Putbus, the last being the old capital of a barony of the princes of Putbus. Sassnitz, Gohren, Sellin, Binz and Lauterbach-Putbus are favourite bathing resorts. Schoritz was the birthplace of the patriot and poet, Ernst Moritz Arndt. The inhabitants of Rügen are distinguished from those of the mainland by peculiarities of dialect, costume and habits; and even the various peninsulas differ from each other in these particulars. The inhabitants raise some cattle, and Rügen has long been famous for its geese; but the chief industry is the herring fishery.

The original Germanic inhabitants of Rügen were dispossessed by Slavs; and there are still various relics of the long reign of paganism that ensued. In the Stubbenitz and elsewhere Huns' or giants' graves are common; and near the Hertha lake are the ruins of an ancient edifice which some have sought to identify with the shrine of the heathen deity Hertha or Nerthus, referred to by Tacitus. On Arcona in Wittow are the remains of an ancient fortress, enclosing a temple which was destroyed in 1168 by the Danish king, Waldemar I, when he made himself master of the island. Rügen was ruled then by a succession of native princes, under Danish supremacy, until 1218. After being for a century and a half in the possession of a branch of the ruling family in Pomerania, it was finally united with that duchy in 1478, and passed with it into the possession of Sweden in 1648. With the rest of western Pomerania Rügen has belonged to Prussia since 1815.

RUGS AND CARPETS. "Carpet" (M.E. *carpeta* or *carpette*, from O. Fr. *carpite* or direct from Med. Lat. *carpita*) was used until the 19th century for any cover made of a thick material, especially a table cover, but now it means almost exclusively a floor covering. This may be of felt, tapestry, a shuttle-woven material or a pile fabric, but the last is the most frequent and typical. Some kind of covering for the floor is indispensable for comfort, especially for the beaten-earth floors in the ancient and primitive orient. Even in the west the advantages of a fabric underfoot are so obvious and even imperative that carpets of some kind have been an almost universal adjunct of civilization, and in both the east and west their manufacture finally developed into a prodigious industry. Such floor coverings offer most interesting opportunities for ornamentation, and in the orient, where both the craft and the art originated, carpet-weaving and design attained, over a period of at least 2,500 years, a remarkable degree of excellence which warrants ranking the finest specimens with man's most notable artistic achievements.

Felt (g.v.) is almost certainly the most ancient of the carpet techniques for it probably originated as bark felt, even as early as the Upper Palaeolithic period, about 25,000–30,000 years ago. It is noteworthy that the earliest existing specimen (4th or 3rd century B.C.) which might be classed as a carpet is felt: a rectangle of black wool or hair felt, about 3½ x 5 ft., with a white border along one side, to which are appliquéd with split-stitch, silhouettes of feline heads about 6 in. high, cut from red or blue felt and evenly spaced in a straight row. This piece, now in the

SPANISH AND TURKISH RUGS, 15TH-16TH CENTURY

1. Spanish rug, 15th or 16th century. Wool; principal colours: red, yellow, blue
2. Cairene carpet, 16th century. About 10 ft. x 9 ft. 6 in. Wool: the colours are: ground tone, a deep cherry red with patterns in sky-blue and yellowish green

CARPET-WEAVING

Indian workers at a loom in one of the factories for the manufacture of hand-made carpets at Jalpur, Rajasthan, in northern India. Between the two rollers which, with the supporting framework, constitute the loom, are stretched the vertical warp threads. The coloured wools (or silks) are knitted in horizontal rows on the warp threads, the knots being made by hand. The knots are made with the fingers of the hands. Carpets are known with as few as 15 and as many as 2,400 knots to the square inch, from 50 to 80 knots being considered a moderately fine texture.

BY COURTESY OF THE CARLISLE PACIFIC STEAMSHIP

Hermitage museum, Leningrad, together with saddle (cushion) covers in the same technique and style, was found in a tomb at Pasryrk in the Altai mountains.

Floor coverings of plaited rushes were also very ancient. Evidences of basket plaiting also appear in the Upper Palaeolithic period, and archaeological finds in Iraq indicate by the 5th or 4th millennium floor coverings of plaited rushes, such as grew in the Mesopotamian swamps.

These made stout, durable, portable mats, and even at an early period they were probably handsomely ornamented, judging from the competence in decorative pattern shown on contemporary painted pottery and on the decorated walls of the Chalcolithic village at Persepolis. The weaving of rush mats has continued to the present in the near east, which had reached a high degree of artistic perfection and prestige by mediaeval times.

Rug design, however, in western Asia at least, had long since evolved beyond the rudimentary scheme of the appliqué felt or the hypothetical iconographic geometry of plaited mats, for a threshold rug, represented in stone carving (now in the Musée du Louvre), from the Assyrian palace of Khursabad (8th century B.C.) has an all-over field pattern of quatrefoils, framed by a lotus border, completed by guard stripes.

Other Assyrian stones of the period also show rich and handsome patterns that have survived in the repertoire of carpets ever since.

The general layout of the Assyrian type is more or less followed in the next oldest surviving carpets, embroidered felts found by Kozlov at Noin Ula in northern Mongolia, preserved by the frozen subsoil in chieftains' tombs (C. Trever, *Excavations in Northern Mongolia* [Leningrad, 1932]; W. P. Yetts, in *The Burlington Magazine*, 1926), likewise now in the Hermitage museum One, e.g. (originally c. 6 ft. 5 in. by 8 ft. 6 in.), had the field filled with a spiral meander; a broad border with animal-combat groups (alternately tiger and yak, and griffin and elk), alternating with a tree; an inner guard stripe of geometrical units; and a wide margin of Chinese lozenge-patterned silk. The patterns were executed with quilting (field), and couched cord (border), and the colours as reconstituted by chemical tests (V. Komonov, Moscow-Leningrad, 1937) were vivid; yellow quilting on a red field; a red border with blue and green figures outlined with white; and green, red, yellow and blue in varying succession in the guard stripes.

Another piece embroidered in wool on wool in stem-and-satin stitches, was still more complex in organization: on the field, a diagonal lattice defined by scrolling stems, with a cross-trefoil at each intersection and a tortoise alternating with a fish in each unit, in blue, purple and tans on a red ground; a diagonally-hatched field margin; beyond, an inner border system, with double guard stripes on both sides; then the main wide border filled with a concentric-lozenge diaper, with an inner guard stripe; and an outer binding of red and brown checked flax and wool material. These pieces are datable by a lacquer bowl found with them which is inscribed with the equivalent of A.D. 3. Some of them

are of genuine beauty; their intricate patterns are clearly delineated and well co-ordinated.

Among these fragments and technically the most interesting are the earliest extant specimens of pile carpets. They are woven of fine, lustrous, still-elastic wool, of deep indigo blue. The pile is very thick and dense, the knots or loops having been firmly compacted, though the strands are merely wrapped round one

warp thread, a simple technique that later made its way to Spain. (A. U. Pope, in Pope [ed.], *A Survey of Persian Art*, Oxford, 1938, III, pp. 227-273.) This same technique is also used in a number of fragments found by Sir Aurel Stein in Loulan, Niya and Tun-Huang in Chinese Turkistan, assignable to the first three centuries of our era (see Stein, *Serindia* [1921], Pls. 3, 7, 8; and *Innermost Asia* [1928]), and was continued in this region at least into the 7th or 8th century, as is proven by a fragment discovered by A. von LeCoq at Kizil.

By historic times the carpets of the near east had attained fame and great magnificence. Classical authors speak with admiration of the luxurious Babylonian carpets (see A. U. Dilley, *Rugs and Carpets*, p. 11), and in the tomb of Cyrus, Alexander the Great found the gold funeral couch resting on carpets of very fine fabric. Both Athenaeus and Xenophon indicate that some of these were thick and resilient, but whether pile woven or embroidered felt we cannot be sure. though some were evidently gold-enriched. Moreover certain types were reserved for court use, and so costly that they were important items in the royal treasury. Carpet weaving was always a king-like concern in near eastern lands.

By late Sassanian times (6th-7th century A.D.) carpet weaving in Persia had won international prestige, and according to the Sui annals woollen rugs were being exported to distant China (*Sui-shu*, chap. 83; Berthold Laufer, *Sino-Iranica*, p. 493). The carpets of this period were of several kinds: woollen or silk, either pile or tapestry woven, embroidered, or even of shuttle-woven silk (*dibaf*) (Pope, *A Survey of Persian Art*, III, p. 2273).

FIG. 5.—TAPESTRY WEAVING

FIG. 6.—SHEMAKA WEAVING, A MODIFIED FORM OF THE TAPESTRY METHOD

Carpets made for the royal palace exceeded in cost and magnificence anything created or imagined either before or since. Surpassing them all was the so-called Spring or Winter carpet of Khusrav, made for the vast audience hall of the palace at Ctesiphon. It represented a formal garden with its water courses, paths, rectangular beds filled with flowers and blossoming shrubs and fruit trees. The body of the rug was silk, the yellow gravel

was represented by gold, the blossoms, fruit and birds were worked with pearls and every kind of jewel. The wide outer border representing a green meadow was solid with emeralds. The rug was about 84 ft. square, and when the great portal curtains were drawn back and the sun flooded the sumptuously decorated and lofty interior (227 ft. high), it must have presented a spectacle of overwhelming splendour, a demonstration of the power and resources of the great king which was certainly not lost on ambitious nobles, restless provincial governors or foreign envoys. It was an effective use of the national treasure which would otherwise have been unproductively locked in dark vaults, and in addition to its political significance and its self-justifying beauty, happily alleviating the grim winter months, such an eternal garden, forever at the perfection of its vernal loveliness, played another role obvious to all at the time; it affirmed with unmistakable authority the divine role of the king, the surrogate on earth of the Almighty on high, for it was the king's primal task to regulate the seasons, to guarantee and compel the return of the spring, thus renewing the earth's fertility and assuring the livelihood and prosperity of his subjects. This gorgeous carpet was the sympathetic call to nature to conceive and deliver the longed-for spring. Moreover the carpet had still further religious significance: it prefigured paradise, was a foretaste of the glory that is to come and the substance of things hoped for. For paradise is a Persian word meaning "walled park," and for the Persians, with its flowers, birds and water, so happily contrasting with the asperities of the desert, it was the abode of all felicity, the reward for struggle and suffering, the symbol of the perfect eternal moment. The whole notion of paradise seems to have entered into Jewish and Christian theology via the Babylonian captivity, and the Persian restoration of the Jews to Palestine.

The carpet was part of the fabulous booty of the Arabs, captured when they defeated the Persians and took Ctesiphon (635). It was cut up into small fragments; one-fifth went to the Caliph Omar, one piece to Ali, the prophet's son-in-law and the rest was distributed to the 60,000 victorious soldiers, who in turn sold their pieces to a Jeweller's syndicate in Baghdad for an average of \$3,000 each, counting the drachma as worth only 25 cents. This is on the authority of Tabari, one of the ablest of the Arab historians, whose account is confirmed by others and by certain internal and supplementary evidence as well. The original value of the carpet was thus certainly in excess of \$200,000,000.

This most sumptuous of all fabrics made a profound impression on all, especially the Persians. It entered as a living, legendary power into history, poetry and art; and for centuries it served to sustain Persian morale. For more than 1,000 years it furnished the model and inspiration for subsequent carpets, though the most ambitious attempts of later years could no more than hint at the general design of this fabulous creation. Of the subsequent

renderings of the garden scheme the oldest is a printed cotton panel to be dated between the 9th and 11th century (O. Wulff-W. F. Volbach, *Spätantike und koptische Stoffe*, Berlin, 1926, pl. 130) which shows in miniature essentially the same scheme, and this has persisted down to the present as one of the best defined carpet designs (fig. 9). The carpets for another of the

FIG. 7.—THE HERATI PATTERN

FIG. 8.—THE MINA KHANI PATTERN

FIG. 9.—GARDEN CARPET, NORTHERN PERSIA, 18TH CENTURY

royal palaces depicted the four seasons, also still a theme of carpet designing down to recent times

The carpets of the Abbasid caliphate at Baghdad (Haroun al-Rashid and his successors) seem almost to have rivalled the carpet of Khusrav. Caliph Hashim, who died in 743, had a silk, gold-enriched carpet that was approximately 150 x 300 ft. The history of this carpet can be traced for more than a century. It was finally inherited by Caliph Mutawakil about 850. Gorgeous carpets are mentioned in all the contemporary descriptions of the period. We know little about their actual appearance, but some had inscriptions; some actually attempted symbolic portraiture of the Sassanian kings; carpets decorated with all kinds of animals were made in Numania and Hira, showing a growing mastery of pictorial effects. Dark blue was probably the commonest colour, but the Caliph El Mahdi owned a rose coloured carpet.

Whether these Sassanian and early Islamic carpets were pile-knotted or tapestry-woven is impossible to say. There is no evidence to support the usual assumption that they were all done in some kind of flat stitch, but tapestry (*q.a.*) [Lat. *tapes*—covering for floors, walls, etc.; Gr. *rares*—carpet, rug; Fr. *tapisserie*, and also *tapis*—carpet, cover] was already by that time a much used technique as well as an old one, for it was well developed by 1500 B.C. (Ackerman, *Tapestry*, p. 12, New York, 1933.) Fragmentary examples, dating from the 7th to the 14th century, have been found on the rubbish heaps of Fustat (ancient Cairo), including some so stiff and heavy that they could only have been floor coverings. Many of these pieces are of genuine beauty, with rich and harmonious colours and ingenious but rational patterns.

Various of the Arabic geographers give valuable though meagre

FIG. 10.—HAMADAN

information about carpet weaving in the near east from the 8th to the 14th century. Armenia was certainly one of the most productive districts. Here were found good wool, clear water and

FIG. 11.—SARABAND PATTERN

fine dyes, especially a fine scarlet made from the *Coccus ilicis* called *hermes* and widely exported. Armenian rugs were famous in the 8th century, and we know that by the 10th such cities as Devin, Van, Kalikala (Ezerum), Bilibis, Vartan, Aklat and Tiflis, all produced famous rugs. Marco Polo credited the Armenians and Greeks in the towns of central Asia Minor (Konia, Sivas and Caesarea) with weaving the most beautiful carpets in the world (Marco Polo, Yule trans. p. xxx). But unfortunately we have no description of these carpets.

In northwest Persia, the towns of Khoi, Bargari, Arjig, Nachshirvan and Mukhan are all credited with rug production. The south Caspian coast, Gilan and Mazandaran, evidently supported an immense industry. Its prayer carpets were exported everywhere, and in the 8th century 600 rugs were sent at one time as tribute to the Caliph Mamun.

FIG. 13.—MESHEH CARPET, 19TH CENTURY. PATTERN BASED ON THE "CLASSICAL" MEDALLION CARPETS

a group of three somewhat fragmentary carpets of strong, repeating geometric patterns in somewhat harsh colours, red, yellow and blue, which were found in the mosque of Ala-ud-Din in

Konia and are now treasured in the Evkaf museum at Istanbul. Local tradition assigns them, reasonably enough, to the period of the Seljuks of Rum, cousins of the Persian Seljuks, who maintained their authority in Asia Minor through the 13th century. In the Berlin museum and in the National museum at Stockholm are a pair of rugs of very primitive design, the former a highly conventionalized dragon-and-phoenix combat, the latter stylized birds in a tree, both patterns that were later richly developed in the Caucasus, which warrants attributing them to the Caucasus of the early 15th century.

FIG. 14.—SO-CALLED "HOLBEIN" RUG. BLUE, RED, GREEN AND WHITE. ASIA MINOR, 16TH CENTURY

A little later there began to appear in Europe, coming from the same as yet unspecified region, a considerable number of rugs of finer weave, more delicate patterns and richer colours. These are also almost wholly geometrical in pattern. They were depicted by the Flemish painters such as Hans Memling, Van Eyck, Petrus Cristus, with such skill and loving care that the separate knots are sometimes visible, and the full artistic character of the rugs, which was considerable, is adequately presented. The designs of many of these rugs have been quite faithfully repeated in the later weavings from the Bergamo district in Asia Minor and from the southern Caucasus almost to the present day—an impressive evidence of the conservatism of rug design which so complicates the problem of dating.

CLASSIFICATION

Because of the difficulty of classification it has been customary to name the great court carpets of the 16th century in accordance with their presumed themes, and we read of "Hunting carpets," "Garden carpets," "Medallion carpets," "Compartment carpets," "Vase carpets" (so-called because of the presence of a vase in the design), "Prayer carpets," "Animal carpets." This classification is hardly more than a temporary convenience, and really evades the problem. These various themes were embodied in the carpets of many different regions and over long periods. A more serious classification attempts to connect a given carpet style with some dominant cultural unit; the court of a great monarch; the locality in which the patterns were developed; the actual place where the carpet was fabricated, including the sources of design elements. This method is difficult because of the dearth of contemporary documents, and because in a court-supervised art, material was often gathered in one place and shipped to some court-subsidized loom, while court-approved cartoons also were apparently supplied to the various weaving centres, and the provinces also copied the cosmopolitan styles in vogue at the capital. On the other hand, we know from an actual document of Shah Abbas that even at his time when the imperial dominion was formally established, in all matters cultural as well as political and economic, the integrity of the local weaving centres was not only respected but the officers of the crown were charged to see that they were preserved. The majority of the more important carpets of the 16th century, in colour, pattern, materials and

FIG. 15.—SO-CALLED "LOTTO" RUG. CONVENTIONALIZED ARABESQUES IN YELLOW ON RED GROUND. ASIA MINOR, 16TH-17TH CENTURIES

technique fall into groups of such marked individuality and integrity that we can be sure that in most cases we are in the presence of a real school. The finest of them are almost all now in museum collections. The complex designs are thought out with perfect lucidity controlled by a rigorous decorative logic, with imagination and frequently with deep feeling for a genuinely noble effect. They are in the proper sense a monumental art. Their very size is impressive. The more important of them may be from 20 to 40 ft. long, and in the 17th century, more than 50 ft., though such a size somewhat exceeds the power of unified comprehension.

The materials, both dyes and wool, were of the finest that the unlimited power and wealth of the shah could command. Sheep were specially bred and tended; dye plantations cultivated like flower gardens; aspiring designers and weavers, could by submitting cartoons or finished work win a court appointment which conferred prestige and privileges which were greatly prized. The 15th and 16th centuries were the heirs to the slowly accumulated artistic tradition of a deeply artistic people. The ambition was there; the material and means were present; and a passion for perfection, which was a special attribute of the Timurid period, where "artists had no other thought than to make their work the most perfect possible," brought about just that unique combination of favourable circumstances which alone supports supreme artistic achievement.

The rugs of this period can with a certain confidence be divided into six well defined groups.

The stately Medallion carpets of northwest Persia, judging by the tonality, the materials and the subsequent history of the type seem to have been done in the vicinity of Karabagh in northern Azerbaijan. At the same time a special court atelier, possibly located at Sultaniya, as an elusive contemporary document hints, translated into carpets the most gorgeous and varied creations that the illuminators could devise. A dozen or more pieces of this group have survived. Each one is a separate masterpiece, and if they do form a class, it is first of all on the basis of outstanding artistic quality, superb design, majestic size. colours of great purity and depth, and perfection of detail. They all use a fine, crisp, very white wool, probably from Ahar in the extreme northwest, which today furnishes the most brilliant wool found in Persia, a wool which takes dyes most beautifully.

This group includes the world's most famous carpets. The great pair of carpets from the mosque at Ardabil, dated 1539 (one owned by Paul Getty, the other by the Victoria and Albert museum, London), are the best known carpets of the period.

FIG. 16.—SO-CALLED "BIRD" RUG. ASIA MINOR, 17TH CENTURY

FIG. 17.—TURKISH COPY OF A CAIRO RUG. 17TH CENTURY

FIG. 18.—SO-CALLED "TRANSYLVANIAN" RUG. ASIA MINOR, 17TH CENTURY

The ornamentation consists of an extremely rich and intricate system of stems and blossoms on a velvety glowing indigo field. which in turn is dominated by a complex golden star medallion. (The colour-quality designations belong only to the Getty piece, as the Victoria and Albert piece was still [1944] in grievous need of cleaning.)

The Ardabil weaving has a near rival in the Anhalt carpet, named for the duke of Anhalt who once owned it, now also owned by Duveen. An intricate star medallion dominates a brilliant yellow field covered with an ingenious system of scrolling arabesques and fluttering cloud bands, framed by a scarlet border. Another pair of carpets from the same region has a scarlet medallion on a white field, which is interspersed with lively animal forms and framed by a dark blue arabesque border. One belongs to the Berlin museum and the other to Paul Getty, the American collector. An impressive pair, one in the Musée des Tissus at Lyons, and the other in the Metropolitan museum in New York (the Lyons piece sadly wrecked, and the New York piece mutilated by reduction) is composed entirely of cartouche patterns enclosing in their irregular spaces brilliant little arabesque compositions. The effect is somewhat incoherent but the pair rises to greatness by virtue of the superb finesse of detail and the magnificent colour.

One of the most beautiful in the series is the animal carpet half in the cathedral of Cracow and half in the Musée des Arts Decoratifs in Paris, by the same designers and weavers as the Anhalt carpet. It has the same glowing scarlet and gold, but with more subtle half-tones (buff on yellow, gray on taupe) and a more pictorial presentation of the paradise park. One of the most striking of the series is the great Tree carpet, also somewhat reduced, that belongs to the estate of C. F. Williams, now in the Philadelphia museum. Like the Cracow-Paris carpet it is a garden scene, with cypresses and flowering trees of glowing vernal splendor.

Historically more important and in beauty a rival of any is the great Hunting carpet in the Poldi-Pezzoli museum in Milan, which carries the precious historical inscription: "It is by the efforts of Giyath-ud-din 'Jami that this renowned carpet was brought to such perfection in the year 1522-23." Again a rich scarlet and gold medallion dominates a field of deep blue, covered with an angular network of blossoming stems, across which in every direction hunters dash after their prey.

This small group, in the opinion of many, represents the supreme achievement in the whole field of carpet designing. None the less, other ateliers under royal direction were also producing many beautiful specimens. One type, also under the domination of the court and possibly done at Tabriz (possibly also at a little town near Hamadan, called Derguzin, in western Persia) reflects even more precisely the art of the illuminator. Some of these are in small size, all with medallions dominating the field which is covered with very intricate systems of two-toned arabesques beautifully co-ordinated and subordinated one with another, with inscription cartouches in the border. More than a score of these have survived and they are like pages from a 16th century manuscript. A few beautiful prayer rugs discreetly illuminated with silver and gold belong to the same group. Most of these rugs have come out of Istanbul

FIG. 19.—GHIORDES PRAYER RUG OF FINE TEXTURE AND SHORT PILE

FIG. 20.—KULAN PRAYER RUG

and may be part of a famous gift of rugs that Shah Tahmasp made in 1665 to the sultan of Turkey. The largest and best-known single example is a beautiful multiple-medallion carpet in the Victoria and Albert museum (London) which Dr Bode was inclined to ascribe to the end of the 15th century and to rank as the finest carpet extant.

But rug weaving was also the concern of other parts of Persia. In Kashan, in the second half silk animal rugs were woven,

FIG. 21.—LADIK PRAYER RUG

carpets. The typical field is a very rich claret or dark *rose du Barry*, covered with a delicious pattern of tendrils and graceful lanceolate leaves, framed by a broad border either in deep emerald green or dark blue, carrying magnificently constructed palmettes alternating with lotus or peony blossoms.

North of Isfahan in the picturesque hill town of Joshaghan a strikingly beautiful and highly individual class of carpets was produced that has been called Vase carpets. The pattern structure is generally a series of ogival latticelike systems which carry a profusion of blossoms interspersed with foliage. Only a few of these whole carpets have survived, of which the pair divided between Lady Baillie and the Berlin museum is typical. The glowing blue of the background and the very finely divided clear colours are scarcely to be caught on a colour plate. There are a scant 20 whole pieces of this splendid type, though many very fine fragments still exist. These rugs were apparently not exported from Persia but used almost exclusively for court and mosque. They are woven on a solid double warp, which gives them a boardlike stiffness that holds them flat to the floor—a desirable feature for a carpet. They are still called in Persia "Shah

FIG. 22.—BERGAMO SQUARE RUG

Abbas carpets." The style (which was indigenous, very ancient and characteristically Persian), reinforced by the prestige of the court, exercised a wide influence, and derivatives show up in Kurdistan, the Caucasus and even in the embroideries of Bukhara, as well as in the court carpets of India.

There are other beautiful carpets of the 16th and early 17th centuries for which the provenance is still doubtful. Magnificent rugs were, we know, woven in Kerman, Yazd and Fars, and perhaps Khuzistan, but just what they were like we can only guess, as we have no extant example that can with any surety be assigned to any of these places.

From time immemorial, the rugs of Persia had been enriched by gold and silver thread, a device that was discreetly used in

some of the 16th century carpets from east Persia, but by the time of that mighty monarch, Shah Abbas, the scheme was carried to a most sumptuous perfection and many carpets of sheer opulence made of silk with great masses of interwoven silver and

FIG. 23.—KUBA CARPET

FIG. 24.—SHIRVAN RUG

gold were made to delight the monarch and to dazzle the astonished ambassadors and travellers from Europe. The most gorgeous of these carpets is the so-called "coronation carpet," still preserved in its pristine splendor in the Rosenborg castle in Copenhagen. The gold background gleams as brightly as the day it was woven and the velvetlike pile, with its accurately drawn arabesques is no less perfect.

As the 17th century wore on, both the demand for more luxury and the increasing wealth that sustained it, multiplied the manufacture of these carpets until they were not only available for purchase to ordinary civilians in the bazaars, but were exported in great numbers to Europe, where more than 200 of them have been found. They are closer to the European Renaissance and baroque idiom, with their high-keyed fresh colours and demonstrative opulence, and the finest of them are indeed beautiful. A large number of these pieces were found in possession of some of the great families in Poland, for Poland had very close relations with Persia in the 17th century, and Polish royalty and nobility ordered gold-threaded rugs of this type from the looms in Kashan. There had been a rug-weaving industry in Poland in the 18th century and a silk-weaving industry also which used

FIG. 25.—BAKU OR KHILA CARPET

gold thread. So when these Polish rugs were first exhibited at the Paris exposition in 1878 it was natural to think that they were really Polish, for nothing quite like them had at the time been found in Persia. They were accordingly labelled *Tapis Polonais*, and the name has stuck to the type ever since. Actually, they were primarily a product of the looms of Kashan but were probably also woven in the royal shops in Isfahan. The style degenerated rather rapidly. By the second half of the 17th century materials were cheapened, weaving coarser and more careless, the designs clumsy and confused.

Similarly the east Persian Herat carpets which came into the European market by way of India and the gulf export trade, partly in Portuguese control, partly in English, became known in Europe as the typical Persian carpet. The demand was furious and the competition among the great of the land to acquire them even had international political consequences, as when the duke of Buckingham delayed signing a treaty with Spain until the Spanish ambassador could procure some of these carpets for his new

palace, Hampton Court. Many of the European artists of the period owned them, and Van Dyke and "Velvet" Breughel, particularly, rendered them with such complete fidelity in dated paintings that we can with a little care and stylistic analysis date these so-called Isfahan carpets to within a couple of decades.

FIG. 26.—DAGHESTAN PRAYER RUG

FIG. 27.—KAZAK PRAYER RUG

The Indian princes also were enamoured of them and acquired them by plunder and purchase alike. The result was mass production with the inevitable consequence of a rapidly deteriorating art. Designers were no longer employed, cartoons were wearily repeated *ad infinitum*, the weavers had little interest or pride in their work, the pressure for speed and for economy deteriorated every process, and the style finally expired in a repulsive mediocrity, painful proof of how and why a great art can be brought to ruin.

During the 17th century there was an increasing emphasis, where the court could afford it, on refinement and luxury, but on the whole a steadily slackening inspiration. Routine increasingly displaced invention. But in 1666, a set of silk carpets was woven to surround the sarcophagus of Shah Abbas II in the shrine at Qum, of such fineness that even orientalists have mistaken them for velvet. The drawing is beautiful, the colour varied, clear, brilliant and harmonious, and the set has the important merit of being dated and signed by a master artist, Nimat'ulla of Joshaghan. This set marks the last really high achievement in Persian rug weaving, although handsome carpets were woven throughout the century and even in the 19th century, and these, despite the increasing poverty of the time and the decline of all the arts, still surpass any floor covering ever conceived or rendered in the western world.

The carpets so far described were all specially made for the court or for the great nobles. They could afford to concentrate on perfection and disregard expense, which was often considerable. Indeed, a carpet like the Ardabil or the Austrian Hunting carpet cost as much as a small palace. Such rugs could be of silk, gold and silver, almost too fragile for anything but contemplation or the most lavish ostentation. They were cared for by special custodians, brought out only as actually needed, often for state occasions only, and even when the king sat on them they were generally partly covered with a lighter fabric for completeness of protection. The mosque carpets had severer and more continuous use. Carpets that reached Europe were for the most part treated with equal solicitude. They were precious items in royal treasuries like the Austrian

FIG. 28.—KAZAK CARPET

Hunting carpet, which Peter the Great gave to the emperor of Austria, the Danish Coronation carpet or the Anhalt carpet, which are all almost as fresh and perfect as the day they were taken off the loom.

Persia.—Little is known of carpet weaving of the 13th and 14th centuries in Persia, but by the 15th the art was rapidly moving toward an artistic climax. The horrors and devastation of the Mongol invasion certainly depressed the artistic life of most of the 13th century, which was only partly restored by the magnificence of the architecture and miniature painting of the Ilkhan renaissance (1290-1355). The bloody conquests of Tamerlane were disastrous to Persia, but he spared and favoured artisans, who were removed in large numbers to work on his great palaces in Turkistan, particularly at Samarkand and Bukhara, where they were chiefly responsible for a new school of painting and decorative design.

Out of this, under the enlightened and cultivated rule of Tamerlane's successors, particularly Shah Rukh (1377-1447) and Balzangur (1396-1433), literature and art in all its branches were brought to magnificent floridity. Out of this matrix came the supreme achievement of the carpets of the 16th century.

These great carpets of Persia, like most of the finest art of the times, were produced in the palace ateliers or on court-subsidized looms and this made for unity and integrity of style, while a sensitive and exacting clientele imposed the highest standards, and the lavish royal support guaranteed supreme technical proficiency, the most perfect materials and the utmost in skill. All these conditions obtained under the Timurids through the 15th century and under the Safavids (1501-1723).

Authoritative at court and generally supervising all artistic enterprises were the miniature painters, illuminators and book binders, for the art of the book had long been considered the supreme accomplishment and a genuinely great calligrapher out-ranked weaver, architect or even poet. The art of the book in the 15th century, which already had behind it centuries of superb achievement, reached a degree of elegance and sophistication that it has never known either before or since. Bindings, frontispieces, chapter headings, and in the miniatures themselves, canopies, panels, brocades and carpets, furnished the spaces, mostly rectangular, which by the taste of the time, called for the richest and most elegant patterning.

The beautiful designs thus conceived were in various degrees appropriated by the other arts and the illuminators were given authority over the weavers whom they tended to regard as mere assistants—at best only colleagues.

This domination of outstanding artists accounts in no small measure for the special character of the court carpets of the period, the variety of colour, the ingenuity and imaginative range of pattern schemes, the superlative draftsmanship which is both lucid and expressive, as well as the intensity of artistic percep-

FIG. 29.—KARABAGH CARPET, BLUE AND MAGENTA

FIG. 30.—TEKKE—SO-CALLED KHATCHLI (CROSS) DESIGN

tion which raised these products to the rank of great painting. Indeed, John Sargent and Sir Charles Holmes, both independently used almost the same words referring to two different 16th century carpets: "There is more art in a really great carpet than

pictorial, the stately palmettes and curving leaves of Persian carpets which were in themselves noble and significant compositions, are reduced in Indian carpets to a meticulous botany, faultless in

FIG. 31.—TEKKE RUG, FIELD PATTERN

FIG. 32.—YONUD TENT BAG OF MEDIUM FINENESS

in any picture ever painted." (See Pope, *A Survey of Persian Art*, vol. I, p. 2)

India.—Very little is known of early and indigenous carpet weaving in India where it was apparently a late development, for in a tropical country carpets are not so necessary as in northern climates where their warmth is an asset. As an art it was brought in from Persia by the Mogul princes in the 16th and 17th centuries. Akbar set up royal looms that were thought to surpass Persia's finest although, as his biographer Abul Fazl tells us, rugs were still imported from various centres in Persia. The Herat carpet-weaving establishments that made the so-called Isfahans, being nearest, furnished models and apparently weavers were brought thence to continue the style in India, where it was rapidly crystallized, with the elements reduced and formalized, the drawing rigid and meagre. Colours and wool also deteriorated and there were few compensating additions from Indian sources.

The carpets made for the courts of the Grand Moguls, however, were of extravagant and luxurious beauty. Shah Jehan, for example, had made for the palace of Amber a set of rugs from the most precious wool, imported from Kashmir and from remote Himalayan valleys. With the Mogul princes, expense was never

FIG. 33.—ERSARI PATTERN, CHIEFLY A BROWN RED

FIG. 34.—AFGHAN RUG, FIELD PATTERN

any object. The cost of fine weaving was quite ignored and a series of carpets turned out with 800 to 1,200 knots to an inch, which provided a luscious velvety texture. Special carpets were of even finer weave and a fragment of a prayer rug has survived (Metropolitan museum) which has the incredible fineness of nearly 2,400 knots to an inch. Master draftsmen, designers and dyers were, of course, employed and no obvious beauty neglected.

But the art was young and its sources were in imitation, not deep in the life roots of the people. The standards of taste were too recent and too personal, and despite the magnificent models they worked from, despite the limitless subsidies which they could command, these wonderful fabrics never reached the artistic height that characterized many periods of Persian weaving. Their beauty is too obvious, there is no deep and significant organization of pattern, there is a want of imagination and a want of feeling for the possible and the appropriate. The aim was too

FIG. 35.—BESHIR PRAYER RUG

FIG. 36.—BELUCHI PRAYER RUG

detail but lacking in meaning, much too photographic to sustain any poetic fancy.

The rug industry, once established, continued down to the present. It became a jail industry, particularly in the Punjab. The designs were increasingly meagre and the art could not longer sustain comparison with the Persian weaving.

The later Indian carpets are mostly very inferior, largely on account of the difficulty of obtaining good wool. Many still have the designs of Persia and of other countries but purely Indian patterns are also common. From time to time better carpets have been made in the factories and during the 19th century the government established a fairly successful manufacture in the jails, but it is rarely that in both design and quality they rival the better products of Persia. The best come from Agra and Warangal, the latter producing some good silk rugs. Carpets from Masulipatam, Mirzapore and Tanjore are very cheap and very substantial but the wool is so

harsh and the colours so dull and gray that they are quite unattractive. Cotton rugs are made in Multan, and tapestry-woven ones, called *daris*, in many places. During the 20th century carpets of good quality, with any desired pattern, are being made in Kashmir, where some handsome reproductions of famous classical carpets have been made.

FIG. 37.—CHINESE TURKISTAN CARPET WITH THREE MEDALLIONS

Turkey.—Turkish rugs, after the 16th century, were of two markedly contrasting types, those made on court looms following Persian designs and possibly the work of imported Persian and Egyptian weavers. Exquisite cloud bands, feathery lanceolate leaves in white on grounds of pale rose relieved by blue and a deep emerald green, carry the rug-weaving art to a special type of perfection. These rugs are somewhat like Persian poetry which was so much admired and copied by the upper classes. The more indigenous Turkish styles are embodied in large and handsome carpets made for a clientele of mosques and nobles; styles best illustrated in the Oushak carpets, ornamented complex star medallions in gold and yellow and dark blue centring on a field of rich red. The so-called Holbein carpets (fig. 14) with Caucasus-like polygon on a

ground of deep red often with green borders and a conventionalized interlacing Kufic such as is shown in Holbein's famous portrait of George Gyszce. A handsome carpet of interlacing yellow arabesques on a ground of deep red appears so often in the paintings of Lorenzo Lotto that the rugs are now designated

FIG. 38.—KHOTAN CARPET WITH "FIVE BLOSSOM" PATTERN

as "Lotto" rugs (fig. 15). From some unidentified region, perhaps Bergamo, come rugs again on a ground of deep muffled red of wonderful depth and intensity, also focused on small medallions. This type developed in the 17th century into carpets known as Transylvanian (fig. 18), because so many of them have been found in the churches of Transylvania. But they are purely Turkish in feeling and have the Turkish merits of rich and quiet colour and placid designs, aside from prayer panels, vases and conventionalized foliage, ultimately of Persian derivation. Many of these are prayer rugs. The majority are dominated by a fine red but a few use a wool that is now approximately the colour of old parchment.

The 17th century saw the development of another characteristic type, erroneously called Bird rugs (fig. 16) as the highly conventionalized pair of arabesque blossoms on stems enclosing a leaf does suggest a bird. The few rugs that have survived are of serene and quiet beauty, the field is of soft ivory white and all the colours discreet and modest.

The Turkish rugs are distinguished above all things by their rich and harmonious colours and their broad and spacious designs. They have none of the lively and intricate movement of the Persian carpets, none of the adroit differentiation of pattern, none of the fugue-like counterpoint where primary, secondary and tertiary patterns are played against one another in subtle rhythms, dissonances and resolutions, Persian qualities unsurpassed and unapproached in these respects by the weaving of any other region.

The Caucasus.—Fine rugs have been woven in the Caucasus from earliest times, for this region provides every facility for the art. The enormous prestige of Persia, the dominant political and cultural power in this region through many centuries and the magnificent carpets produced at the court furnished models for the more serious Caucasus weavings that were made for the local nobles or khans. But the Caucasus has its own individual character and while it took motives from other sources, like the dragon and phoenix fighting (so common in Persian illuminations), sunburst medallions, latticelike field divisions derived from the Vase carpets and other sources, or repeating lotus forms often in huge scale, all these contributory elements were completely transformed, and were used only as indications or design material to be refashioned. The Caucasus rugs, perhaps because of questions of expense (for the little Caucasus kingdoms could never compete in luxury with sultans or shahs) were of coarser weave, the famous Kuba Dragon carpets being not infrequently less than 80 knots to the square inch, and hence the designs were much simplified; but the taste that controlled these virile and powerful

designs was genuine and original and warrants classifying the rugs of this region as one of the principal types.

One of the most famous of the Caucasus weavings, the Dragon carpets, concerning which there has been a heated controversy, seems to have come from the town of Kuba, which was one of the great weaving centres. These carpets are of a prodigious scale and furious vigour of design that has no rival in the textile world (A. U. P.).

Central Asia.—As the carpets of western Turkistan are made by nomadic Turcoman tribes living in tents and constantly moving about, it is not to be expected that very old ones can still exist. Probably in fact few go back more than 100 years, though it is almost certain that similar rugs have been made for centuries. Turcoman rugs are easily identified, for they all, excepting the Beluchis, have a dark red colouring and geometric designs. Many of the older pieces are not in reality rugs at all though those intended for hanging in tent doorways have that appearance. Many are just bags used for storage in the tents or on the pack animals. Those called camel bag measure about five by three feet, and the tent or wall bags three by one or more. Saddle bags consist of two squares of about two feet, joined together. There are also long bands about a foot wide and perhaps 60 yards long, which are for wrapping round the large tents. The small squarish rugs and larger ones of about ten by seven feet seem to be later in date and were perhaps made chiefly for sale. The Turcoman carpets (wrongly called Bukhara) have woollen warp, weft and pile, two lines of weft and nearly always the Sehna knot. They are surprisingly well woven for nomads with none but the most primitive appliances. After the predominant red, the chief colours are blue, white and a natural black that tones to a very pleasant brown. The characteristic design is the octagon—or so-called elephant's foot—arranged in rows and columns, often with diamond-shaped figures in between. The doorway hangings—called Tekkes (see fig. 30)—have cross shaped panelling and the smaller pieces often have a rectangular diaper. Woven end webs and tassels are freely used as embellishments.

The best classification is on a tribal basis.

Tekke.—These are often very finely woven, sometimes with 400 knots to the square inch. The principal colour is a deep muffled red (fig. 31).

Yomud.—Of medium fineness, mostly with the Ghiordes knot. The chief colour is a purple red, and there is a good deal of white, especially in the border. In the pattern diamonds often displace the usual octagon (see fig. 32). The long tent bands, which have the pattern in pile on a woven ground, belong to this group.

Saryk.—Like the Tekkes but with an almost black-purple or very deep crimson colouring, together with some very prominent white. Not very common.

FIG. 39.—PILLAR CARPET, DRAGON DESIGN

Ersari.—These are rarely large pieces. The chief colour is a brown-red; dark green and a little bright yellow are characteristic. The patterns are very varied, with a tendency to zigzags, diagonal lines and spotted effects (see fig. 33).

Afghan.—Mostly large rugs with long pile and a pattern of large octagons almost touching in columns (see fig. 34), and akin to the Ersaris.

Beshir.—A rare type apparently made near Bukhara, with rich colouring including a lot of yellow, and patterns apparently based on the Persian. Many are prayer rugs with a characteristic pointed arch (see fig. 35). Large carpets are more common.

Beluchi.—These differ from the other Turcomans in that they have a black weft, and dark purple and red colouring, sometimes

with natural camel-colour and very staring white. The patterns are almost geometrical but the prayer rugs often have tree forms (see fig. 36). Most of them come from eastern Persia in the vicinity of Khaf near the Afghan border.

Chinese Turkistan.—The earliest rugs of Chinese Turkistan date from the 17th century and mostly have a silk pile and some metal and gilded thread. The patterns are formal floral ones, based on the Persian but with unmistakable Chinese treatment of the detail. The later carpets are loosely woven with the Sehna knot, wool, or more rarely silk pile, and a cotton warp. The 18th century examples have rich but dark colouring, which during the 19th century gets gradually more vivid until at last it becomes excessively crude. There are two important types of design.

Medallion.—These usually have three medallions suggesting in shape a square with well-rounded corners (see fig. 37). One border almost invariably has a conventional Chinese pattern of foam-crested waves. This pattern is mostly called Samarkand in the trade, but the rugs themselves come from Kashgar and Yarkand.

Five Blossom.—These have a floral diaper with characteristic groups of five blossoms (see fig. 38). The colouring is often richly red and orange with a little clear blue.

China.—The rugs of China proper are easily recognized by their characteristic Chinese ornament. They are of coarse texture and are woven with the Sehna knot on a cotton warp; the pile is thick with a very smooth surface. A peculiar feature is the clipping of the pile so as to form a furrow at the contours of the pattern. The prevailing colour is yellow, sometimes intentional but often resulting from the fading of shades of red and orange. Blue and white are also freely used but there is little true red, brown or green.

Some of the carpets have repeating scrolling plant forms. Others have, scattered about, flowers, medallions of frets and the countless symbols that are so familiar in Chinese art. Frets of the Greek type are very common in the border. Pillar carpets are peculiar to China. They are designed (see fig. 39) so that when wrapped round a pillar the edges will fit together and give a continuous pattern, which mostly is a coiling dragon. Many small mats, seat covers and the like are found. The dating of Chinese rugs is an almost impossible task, as patterns have varied very little with time, and internal evidence is almost nonexistent. During the 20th century numbers of large carpets have been made for export.

Morocco.—Large carpets, twice as long as wide, are made in Morocco. They are loosely woven with very bright but mostly faded colours. The field is often cut up into rectangular panels filled with ornament taken directly from Turkish carpets.

Spain.—Carpets seem to have been made in Spain as early as the 14th century. They are made entirely of wool. The knot is tied, or rather twisted, on one warp thread instead of on two, and the weft passes several times after each row of knots. The colours are bright and few in number, little being used but yellow, blue, red and green. The designs fall into two groups, being based either upon oriental models, such as the geometrical Turkish one or upon purely Spanish ornament. The latter type of carpet frequently introduces heraldry. One early type of long rug has shields of arms on a field with a honeycomb pattern introducing plant forms and birds. A common design is a succession of foliated wreaths; another is a diaper of *ogee* compartments containing the floral device known as the "artichoke." Few knotted pile carpets seem to have been made after the 17th century, but small rugs woven in narrow breadths with a looped pile were common until very recently. They come principally from Alpujarras in the Pyrenees.

England.—The art of making hand-woven carpets in England soon followed their importation from Turkey, though actual specimens of the 16th and 17th centuries are so rare that only about a dozen complete rugs are known. They have a hempen warp and weft and a woollen pile of medium fineness, tied with the Ghiordes knot. The ground is usually green and there are so many shades of the other colours that the whole number of tints is greater than in oriental carpets. The designs may be divided

into two groups. In the first are found typical English patterns resembling contemporary embroidery, and often introducing heraldic devices and, fortunately, dates. The earliest known carpet of this type belongs to the earl of Verulam and is dated 1570. Large numbers of pieces of carpet knotting—called at the time "Turkey-work"—were made for covering chairs and stools. As the demand for carpets increased in the 18th century small factories were started at Paddington, Fulham, Moorfields, Exeter and Axminster, and the home production was stimulated by premiums offered by the Society of Arts in 1756. The designers continued to adopt the decoration of the time or to copy eastern carpets. The famous Axminster factory worked on well into the 19th century and then became merged into the Wilton factory, which is still in operation. With the advent of machinery the industry dwindled and almost disappeared until, about 1880, the craft was revived by William Morris. Quite late in the century a successful factory was opened in Donegal and during the 20th century many small rugs have been knotted by handicraft societies, though their products can scarcely compete commercially with the machine or with the oriental rug. (C. E. TA.)

THE UNITED STATES

The first carpet factory in the United States was established in 1791 by W. P. Sprague at Philadelphia. From that time the development of carpet-weaving machinery has progressed rapidly, especially in the line of broadlooms. One of Sprague's earliest Axminster carpet designs represented the arms and achievements of the United States. This attracted the attention of Alexander Hamilton, who recommended the imposition of a small duty on imported carpeting, thus initiating the policy of a protective tariff. While in the early days of carpet manufacturing in the United States, looms were imported from Great Britain and the continent, it was not long before looms were invented and constructed in the different carpet mills which had come into existence in several cities in the United States. The Jacquard pattern device was put into use in the United States shortly after its introduction in Europe. At Medway, Mass., in 1825, a small ingrain carpet mill, owned by Henry S. Burdett and managed by Alexander Wright, was started with hand looms brought from Scotland. In 1839 Erastus B. Bigelow began experimental work at Lowell, Mass., which resulted in the perfection of the first power loom ever made for weaving carpets. This was an ingrain type, and was followed by Mr. Bigelow's development of the Brussels power loom in 1848. John Johnson of Halifax, England, undertook tapestry and velvet weaving (*q.v.*) in Newark, N.J., producing the pattern by printing the dyestuff on the individual strands of yarn. In 1876, after several years of research, Halcyn Skinner invented the moquette or spool Axminster at West Farms, N.Y. James Dunlap, in Philadelphia, developed a method of printing tapestry and velvet carpeting in the finished fabric. Imitation Smyrna rugs were made in considerable quantity by many factories during the latter part of the 19th century, the process being of the chenille Axminster type, but double faced. The three-quarter width or 27 in. was the limit of weave in the several types for long periods after invention, but in the closing years of the 19th century a movement to widen the looms began in the United States. The ingrain carpet and Smyrna rugs gradually lost favour, while the tapestry, velvet, Axminster, Wilton and chenille rapidly grew in demand as the processes were perfected and the looms widened. Rugs were first formed by sewing carpet strips together. Later the corners of a border pattern strip were mitred to form the framed design effect. Slowly the necessary changes were made to allow weaving the border patterns in the straight strips and avoid the mitred corners. (See CARPET MANUFACTURE.) To eliminate the seam through the centre of rugs and in the medallion designs, popular at the time, required a wider strip and loom to weave it. Looms nine feet in width followed this trend in tapestry, velvet and Axminster in the early years of the 20th century and Wilton broadlooms followed after many years of experimental work and became popular about 1926. All these weaves are commonly woven up to 15 ft. in width and even wider looms were developed. The chenille weave, developed in Great Britain

in 1839, was not introduced into the United States until 1909 and was not produced in quantity until 1916. It has had a steady growth since because it is the only woven floor covering that can be woven to special order up to 30 ft. in width, any reasonable length, any shape, design or colour arrangement and an inch or better in thickness. (X.)

France.—There are early records of carpet weavers in France, but nothing is known of their work until the foundation of the famous Savonnerie factory near Paris in 1626. There many large carpets were made, mostly with flaxen warp and weft and a woollen pile tied with the Ghiordes knot. The designs accord with contemporary French decoration and few if any were based on oriental carpets. In 1825 the factory was closed and the manufacture transferred to the Gobelins tapestry factory. During the 18th century and afterwards many tapestry-woven carpets were made at Aubusson and in other tapestry factories.

Other Countries.—A few carpets are still in existence that were made in Poland in the 17th century, with floral patterns in light colouring. Loosely woven rugs have been much used by the peasants of Finland. They often have human figures and dates and seem mostly to have formed part of the bridal dowries. Kilims are made in the Balkan states and in southern Russia; they resemble the Turkish pieces but have, especially the Russian, more naturalistic floral patterns. Those from Rumania generally include birds in the design.

PRACTICAL CONSIDERATIONS

It is perhaps more important that a carpet for use should be soundly made than beautiful, and certainly better that it should be beautiful than that it should accord with any particular scheme of decoration. Oriental carpets, on account of their depth of tone, rarely go badly with other objects. Accordingly when buying, the first thing to ascertain is that the foundation threads are sound and strong and that the pile is not unduly worn away. If a rug is held up to the light, holes and thin places are often revealed that were quite unnoticed when it lay on the floor. Holes that have been properly repaired are of little consequence. It should be noticed whether it is of good shape and whether it lies flat on the floor. Few rugs have the sides perfectly parallel but an excessive distortion is unsightly. A rug that is not flat tends to wear badly in the baggy places, but certain good rugs, such as the Shiraz, are rarely quite free from this defect. A guarantee should be asked that the rug has not been chemically treated, as is too often done with the object of effecting a supposed improvement in colour. Such treatment usually results in a hopeless deterioration of the yarns. Undesirable though less destructive, is the process of hot rolling, which gives to inferior wool a silky gloss that is only transitory.

The Care of Carpets.—Carpets will give remarkably long service if treated with proper consideration. Their two great enemies, apart from the inevitable destructive effect of wear, are moth and damp. The former is best kept at bay by frequent moving or handling and by regular exposure to light and air. If rugs must be stored, then inspection at intervals is essential. A carpet in use is rarely in danger. There seems to be a great future for certain chemical applications that render the wool uneatable by moth, but the method appears not fully established. Damp will in time rot the threads and destroy the fabric, but it can be avoided by obvious means. If any mechanical injury is suffered, such as a cut or burn, the damage should be dealt with as soon as possible by a competent repairer, for such lesions get worse very quickly. In ordinary use, quite apart from accident, the ends and sides often tend to wear and fray out, in which case the parts should be re-overcast—a very simple operation if done in time. Places in the middle locally worn or damaged can have new knots inserted and even large holes can be restored so as to be almost as good as new, though such work is rather expensive. In carpets of lesser value, instead of new knotting, patches cut from a suitable rug can often be inserted at less cost, and sometimes a serviceable small rug can be made from a larger worn one by cutting away the bad parts.

From time to time but not more often than necessary carpets

should be cleaned and the improvement in their appearance is often astonishing. If there is any doubt as to the stability of the dyes of the carpet, it should be entrusted to one of the many firms who specialize in this kind of work. In many cases, however, surface washing with a limited supply of hot water and carpet soap applied with a stiff brush may be done at home, though drying the fabric afterwards is often a difficulty, as a clean and airy place must be available for some days at least. It is most important to wash out all traces of soap. Some of the new cleaning compounds using iridium as a base are superior to soap. In ordinary use carpets are properly kept free from dust by brushing, or by means of a vacuum cleaner, but in all cases where a brush is employed it is most important that it is not used against the lie of the pile. (See also TEXTILES AND EMBROIDERIES; TAPESTRY; INTERIOR DECORATION.) (C. E. TA.)

Uses of Carpets.—The carpets so far mentioned have been practically all special productions for a wealthy clientele but at the same time, although few have survived, the common people also had their rugs.

Throughout the near east rugs have from the beginning been for commonest use and an affair of the whole population. This very universality was one of the reasons for their excellence. The traveller Herbert from England, writing in the 17th century, said there was no house too poor but what it was furnished with carpets. From immemorial time they covered the floors of house and tent as well as mosque and palace, and served many other uses besides. They made handsome portieres and were sometimes hung on the wall like tapestries. They were a convenient, portable and durable form of wealth, served as tribute money, and were frequently gifts of one state to another. They were used as blankets, canopies and tomb covers. In past times they were also handy for committing and concealing murder. The last caliph of Baghdad (1357) made his tragic exit via a carpet in which he was rolled up and beaten to death, a not uncommon mode of execution, quite the reverse of Cleopatra's dramatic entrance to the presence of a Caesar (Mark Antony) when she stepped out of an unrolled rug. Woven with an apex that could be pointed to Mecca, they served as prayer rugs for an individual, or, given sufficient size and reduplicate prayer panels, they could serve simultaneously for a whole family or some religious fraternity. They made excellent saddle covers and carryall bags as well. These modest rugs had their own merits. They were closer to the life of the people; the best of them have an air of genuineness and respect for the limits of the craft. On them were lavished loving care, into them were woven life-protecting symbols which in early times people understood and took seriously—even now the meanings of the more obvious patterns are dimly remembered.

Size and Shape.—Rugs—a term understood to include all carpets for use on the floor—are mostly rectangular, though occasionally pieces are seen made to fit into irregular spaces, and a few round carpets are known, probably woven for tents. The rectangle may vary from a square to a strip at least six times as long as it is wide. A very usual ratio is about three to two. The strips, called runners or *kanara*, made in pairs to go along the sides of a Persian room, are very useful in corridors. A very common size for small rugs is about 6½ ft. by 4½ ft., while large ones may reach 25 ft. in length or occasionally more.

A very common room size for modern carpets is 10 ft. by 14 ft. but not for old carpets which are much narrower in proportion to length, owing primarily to their use in combinations in the oriental house. Some old carpets are nearly three times as long as wide, for example, the famous McCormick Vase carpet now in the Metropolitan museum is 10 ft. by 29 ft. Some of the palace carpets woven in the early 17th century (especially of the Herat type) are 50 ft. long. There are recently woven fine quality hall carpets in the ministry of foreign affairs in Tehran that are approximately 6 ft. by 12½ ft.

The Low School Rugs of Persia.—By the end of the 17th century the summit of the rug-weaving art was past. The impoverishment of the court and the general slackening of cultural energy throughout the near east are clearly reflected in the

steady decline of the court art. None the less the conditions out of which this art arose continued to operate in more humble circumstances throughout most of western Asia. The wandering nomads and the settled town dwellers alike continued to design and weave carpets which if increasingly stereotyped and of steadily diminishing artistic vigour, none the less maintained genuine artistic character until within a few generations ago. They used dye methods that had been developed and tested through centuries. Each group stuck to its own characteristic pattern content to maintain the artistic tradition intact with little addition or embellishment. These carpets were not made for a greedy impatient western market and could with oriental respect for time and perfection continue to embody traditional merits of high quality. Most of the indigenous rug weaving centres have been corrupted by western demand and the commercial organization of weaving centres, but these various humble rugs, the so-called Low School type, are frequently of a very high artistic character, beautiful in colour, design, of fine material and excellent technique. They are worthy of the collectors' enthusiasm of the last 50 years and deserve a more serious study as works of art than they have received.

The identification of the localities in which these humble rugs were woven is by no means certain. Russian investigators have identified about 40 or 50 weaving centres in the Caucasus but the results are not yet published. Names are attached to rugs frequently in the international markets at Istanbul, Smyrna and Tabriz, and do not fully correspond to the actualities. Different and contrasting rugs are often woven in closely related districts, such as Bijar and Sehna, where similar appearing rugs may be woven in districts far apart. The nomadic wanderings, the forcible transfer of populations several times in the 18th century, tribal intermarriages and many other factors have tended to confuse the type and conceal their true origins. A few of the better known types may be briefly designated.

Kashan was noted for its fine textiles as early as the 12th century, and by the 16th it was producing the sumptuous velvets rivalled by even more sumptuous silks and in the 17th by the silver and gold-threaded rugs called "Polonaise" carpets. The skill and tradition survived and Kashan has produced the finest woven, most elaborately designed, richly coloured rugs of recent times. Their high cost restricted the output and the best of them were finally crowded out of the market.

Joshaghan, 60 mi. northwest of Isfahan, wove the great Vase carpets of the Sefavid period and like Kashan and Tabriz continued fine weaving down to the present day. During the 19th century the most characteristic Joshaghans were distinguished by flower sprays, very precisely drawn, on a field of soft red.

The finest rugs made today come from special looms in Meshed and Birjand which have been especially favoured by court orders. The materials are excellent, the weaving leaves nothing to be desired, the colours are beautifully toned and need no chemical washing as do most contemporary eastern carpets, though the designs still lack the spaciousness, the originality and expressive power of earlier days.

These less pretentious rugs, the product of tribal nomads or of sedentary townfolks, maintained their standards down to the latter half of the 19th century when their near ruin as art was completed by western commercialism with its insatiable demand for quantity, cheapness and speed.

Western taste also intruded destructively, and European importers began to supply designs with confused or meaningless patterns, and to order shapes and colours that were in conflict with the oriental tradition. Competition was intensified and the weaver reduced to an animated machine. Aniline dyes, harsh and fugitive, displaced the older, far more costly dyeing processes. Poor wool was cheaper than good, and various processes of chemical washing temporarily concealed the deficiencies and imparted an enticing sheen to the carpet which the unsophisticated thought charming.

However, the more intelligent European importers were aware of the destructiveness of such practices and made real efforts to arrest the deterioration of the craft and to restore something

of the old quality, though the factory system was now too well established ever to be displaced. The Persian government made several sporadic attempts to contest commercialization, imposed severe penalties for the use of aniline dyes, but the commercial tide was not so easily checked. In recent years the government, however, has made a much more systematic effort to revive the art, with considerable success. A school of design, under Taberzadeh Behzad in Tehran based its work on faithfully studied 15th and 16th century models. Sound methods of dyeing, wool selection and testing are taught and the school graduates go into the various rug producing districts to improve their standards. In various places the original, indigenous methods have been maintained, and particularly in Meshed and Birjand, carpets are woven which for technical competence and in beauty of colour stand comparison with the 17th century weavings. The art of designing great carpets, however, is not so quickly recovered. The tendency to over-elaboration needs to be curbed by a more sympathetic study of the early models with their aristocratic restraint and the fundamental strength of their designs.

The principal weaving centres in the 19th century were Tabriz in the northwest, Joshaghan in central Persia, Kerman and Ravar in the southeast and Meshed in the northeast. These centres have all woven large carpets, Meshed, Kerman and Tabriz utilizing the medallion schemes of early classical time, Joshaghan and some Kerman carpets repeating various interpretations of the garden motive.

The province of Azerbaijan in the extreme northwest of Persia is ideally fitted for rug weaving. Excellent wool, water and dye plants are readily available, and hence it is natural that the region has produced some of the finest rug types. Among the more important are those from Karadar and Karajar, where the weavers remained faithful to the highest ideals until they were no longer producing. The region around Ardebil produced many handsome nomadic rugs difficult to identify. South of Ardebil the principal types have been the so-called Heriz, Gorevan and Serapi carpets that make liberal use of tan and blue and hold to bold and simple patterns.

The Kurdish region in northwest Persia produced many fine medium-sized rugs in thick lustrous wool of fine colours, repeating the designs of other parts of Persia. Curiously enough, in the heart of the Kurdish district from the immediate vicinity of the town of Sehna (now Senanda) have come finely woven carpets and kilims. The patterns are exquisitely rendered medallions or the *bouté* (the so-called pear or palm leaf motive), with imbrications.

A great rug industry was developed in western Persia in the Sultanabad district. From individual towns came beautifully woven rugs like the Sarouks, with their ancient medallion pattern; the Sarabandes, with their repeating *bouté* patterns on a ground of silvery rose, the Ferraghan, with their so-called Herati pattern—an all-over, rather dense design with a light green border on a mordant dye that leaves the pattern in relief. The earlier Ferraghans (two are known, dated at the end of the 18th century) are on fields of dark lustrous blue and a pattern delicately drawn and clear and open. Later, toward the end of the 19th century, Ferraghans degenerated in colour and material; the pattern became clumsy and crowded.

The Kerman rugs were made of brilliant wool, finely and skillfully woven, and beginning about 1870, they became the most favoured of all the Persian weavings. They are lighter in tone, thanks to the discreet use of light ivory and pale rose, and were particularly adapted to western drawing rooms in the late 19th century, with their over-emphasis on elegance.

From the province of Fars come a large number of semi-nomadic rugs and a few large-scale carpets, reflecting ancient models. The Bahtiar region west of Isfahan turned out a few large double-warped stoutly woven carpets and a few smaller rugs that occasionally attained very great merit. Northeastern Persia from Meshed down to Birjand and Ghayian produced large carpets predominantly violet or purplish in tone with wide multiple borders and very soft and not too durable wool.

Throughout Persia in the 18th and 19th centuries, probably

about 50 to 100 different types of rugs were woven. Occasionally large carpets of quite individual design, but all with their roots in the classical past, appear to baffle the students seeking for precise classification. Extensive studies are required for their identification and interpretation.

Caucasus—Low School.—The Low School rugs of the Caucasus region are among the most individual and satisfactory. Their patterns are practically all geometrical densely juxtaposed generally without organic connection and without implied movement, but they are clear, ingenious, logical and entirely suitable for floor decoration. The more recent examples seem a little dry in colour but many of them, like the rugs woven by the Kazaks, Suruks and other nomads, are sometimes of flaming brilliance, and the older rugs from Daghestan, Kuba and Shirvan are done in beautifully clear, discreet and well balanced tones.

Kilim or tapestry rugs were woven all over the near east, but the most artistic come from the Caucasus. The Shirvan kilims, with their broad horizontal stripes, have bold and clearly defined motives that are harmoniously assembled by virtue of their perfect colour balance.

A more important type of flat-stitch carpet, embroidered and with a mass of loose threads at the back, which comes from the region of the ancient fortified city of Shemakha, has been improperly called cashmere because of its superficial resemblance to cashmere shawls. The design is most often composed of large, beautifully articulated mosaic tile patterns in rich and sober colour. In design they are descendants of the carpets that so delighted Memlinc and the Van Eycks.

Turkish—Low School.—The Low School rugs of Asia Minor of the 18th and 19th centuries continue the earlier qualities of quiet and sober patterns and luxurious colour. Some of the 18th century weavings still faithfully follow the simple geometrical patterns of the 15th century. But the chief output of the Turkish weavers are prayer rugs, with which the Turks were more lavishly supplied than any other of the faithful. Melas, Konia, Ladik, Kirseher and Sivas all wove handsome carpets, those of Ladik being the most brilliant, both in pattern and colour. The most famous prayer rugs came from the towns of Ghiordes and Kula, mostly of the 18th and 19th centuries, and in the United States, the first passion of the collector. Regions like Smyrna produced a great many utility carpets for the western world.

Knotted-Pile Technique.—The technique used in the earliest extant pile fragments is logically also the most primitive, for the pile yarn is wrapped round only a single warp, the warps being held together by two or more wefts woven the full width in ordinary cloth binding (alternately over and under), after each line of knots. Such a technique was most probably invented among the nomads of the central Asiatic steppes and may well have evolved out of a still more rudimentary weave still practised in the Kergiz tribes whereby a simulated fleece is made on a straw mat by catching in bits of wool in the course of the plaiting (A. U. Dille, *Rugs and Carpets*, p. 1).

The simple pile looping around a single warp had travelled, by the early middle ages, to the east Mediterranean for it is found in pile carpet fragments recovered from the Fustat refuse heaps. A fine example (Musée Arabe, Cairo) bears on a dark blue ground an inscription in white Kufic letters which makes it datable in the late 9th or early 10th century. Not long thereafter the technique was carried into Europe and was used in Germany, at Quedlinburg, at the end of the 12th century, for a hanging illustrating an allegory centred on Mortimer's *Marriage of Mercury and Philologia* (Ackerman, *Tapestry*, p. 33). Moreover, by the beginning of the 14th century *tapisserie sarrazinoise* is discussed in industrial statutes, and clearly differentiated from both *tapisserie nostre* and *haute-lisse* (true tapestry). Evidently looped-pile weaving continued in Europe (*ibid.*, pp. 312-313). The same technique was still in use in Spain in the 17th century.

Meanwhile in Egypt and probably other east Mediterranean centres also, two other forms of looped weaving were being developed which made either a potential pile (uncut pile) or actual long-ended pile surface. One of these practised in two variants, was a forerunner of velvet. In this a supplementary weft for the

pile is carried on top of regularly spaced foundation wefts (from the fifth to the ninth in general) and passes under a certain number of warps to hold it firm (from three to six overpassed warps, as a rule), then is deeply looped over a single warp, and so repeated; or alternatively, it is deeply looped between two warps. But the second of these loop weaves contains the germ of the development of true rug-knotting form. This, the supplementary weft after passing under a certain number of overpassed warps in the same way (e.g., two), is then floated over a certain number of them (e.g., two or three), and is carried back under the same number of warps. This leaves a cut end at the beginning of the unit (of say seven warps in all), and another in the middle thereof—a coarse version of the knot which came to be known as the Persian knot. The two techniques were used equally for garments and wall hangings but the latter was used also for carpets as is shown by a good-sized specimen in the Metropolitan Museum from Antioch, datable c. A.D. 500-600, with a broad conventional polychrome design (M. Dimand, in *Metropolitan Museum Studies*, iv, pp. 159-61 [1932-33]).

But the earliest true knotted pile carpets are not in the knot related to this form of looped weaving, but the alternative, so-called Turkish knot, which had been developed by the 14th century at least, as the Ala-ud-Din carpets show. Moreover by the end of the 15th it had penetrated Europe for a fragment of an Annunciation, probably Flemish, possibly French, is in this technique (E. B. Saxe, in *Metropolitan Museum Studies*, I).

In these fully evolved forms of the technique the pile yarn, instead of being wrapped round a single warp (fig. 1), is knotted round two. These warp threads—most often cotton, but in both Spanish and near eastern nomad rugs sometimes wool, or in some finer qualities, silk—are stretched vertically on a loom (fig. 4), and a length of the pile yarn is tied on every two threads the full width of the loom; then two or more weft threads likewise of any of the materials cited, or of a combination thereof, are cloth woven (alternately over and under), back and forth across the full width, two or more times, and the process is repeated. There are thus three sets of threads involved, each with its specific function: warp, weft, pile. The pile is usually wool but may be silk or cotton, though the last is not desirable except for very small areas where the crisp accent of an unfadeable white is wanted. In the Turkish pile knot (fig. 2) the yarn is passed under one warp, back over two, and back again under the second so that both ends come up together between the two warps on the same side of the overpass loop. In the other type (fig. 3) the yarn passes under one warp, over and back under the next, so that the two ends stand on the surface with one warp between them. The pattern is obtained by changing the colour of the pile yarn. When a row of knots is tied it is beaten down with a heavy mallet-like comb against the preceding rows, so that the pile completely conceals on the front both the warp and weft; and when a certain area is woven the pile ends are sheared to an even height, which varies according to the character of the rug from very close to, on some nomad rugs, a depth of about an inch, which produces a shaggy effect.

The fineness of the weave depends on the number of knots to the square inch which varies according to the weight and spacing of the warps and also, though to a lesser extent, of the wefts, and the thickness of the pile yarn. The permissible range is from about 80 to the square inch, used for instance in some of the Kuba Dragon carpets of the late 16th or 17th century, to more than 2,400, found in a fragment of a Mughal (Indian) prayer carpet of the 17th century, obviously an emperor's property (Altman collection, Metropolitan Museum, N.Y.). But the most finely woven carpets are not by any means those of greatest artistic or historic importance. Thus, e.g., the beautiful and famous pair of carpets from the mosque of Ardabil, dated by an inscription 1539, have only about 325 to the square inch.

In certain types of pile rugs, both wool and silk, some areas are brocaded with gold or silver thread, usually cloth woven but with a surface float over several warps (basket-weave) to obtain the maximum richness. In these the weft is carried forward over four of the warp threads and then backwards behind two (see

fig. 6). This gives a kind of herringbone texture at the front and a series of ribs at the back of the fabric. Because a weft looped round the warp threads as described has much less than the usual binding effect, alternate wefts are cloth-woven, but these are concealed in compacting the loop-woven wefts, which are changed in colour according to pattern as in straight tapestry weaving.

Dyes.—Red is most often obtained from madder root (*rubia tinctorum*). Thus the red of the Noin Ula carpets is madder with the usual alum mordant. The shade which runs through the gamut of reds and pinks to reddish brown and orange varies with the age of the plant, and also other components, including the mordant, the density of the solution and the duration of the immersion. Some reds, however, are obtained from the *coccus ilicis* which breeds on oaks in the near east, related to but not identical with the cochineal (*q.v.*) (*coccus cacti*) of Mexico. Blues are made from indigo. The yellow of the Noin Ula carpet is rhameetin, the dye obtained from unripe berries of various bushes of the Rhamus family. The famous saffron (*q.v.*) dye, made from the dried stigmas and part of the style of a crocus (*Crocus sativus*) is too expensive to use to any extent. Greens are usually blue plus yellow; violets (only rarely used), red plus blue. Black, when not the natural wool, is done with iron filings in citric acid, a corrosive dye whose destructive effect on wool especially is often conspicuous in old rugs. White is the natural wool, but occasionally when a sharper white is desired, a little cotton is introduced.

The time required for weaving rugs has been very greatly exaggerated. They are often spoken of as having required lifetimes, but a careful check made by Heinrich Jacoby (*A Survey of Persian Art*, vol. III, p. 2464) shows that the finest carpets would hardly have taken three years. Even the huge Ardabil carpet, with its 33,000,000 knots, could have been woven, from the preparation of the cartoon through all the processes to its completion, within four years. Great carpets like the Milan Hunting carpet probably only required a year and a half.

Another common fallacy concerning rugs is that they were designed to be seen on the floor. This is only partly true; most of them were worked on vertical elements and the designs are traditional and derivative and not very often planned in relation to the destined environment of the carpet. Moreover, the great court carpets of the 16th century, for example, were the work of illuminators who were accustomed to think of the book page and a vertical design. The designs of the great carpets, when seen on the floor from a normal eye height, are compressed and distorted. Their full effect comes only when hung where they can be viewed so that the eye is nearly equidistant from all points.

Carpets in museums are almost all underlighted. Oriental fabrics were all woven and used in regions of high illumination and their colours are only at their maximum and in proper relation to one another when the illumination is strong.

Design.—Both the pile carpet technique and the flat techniques, whether straight tapestry or the looped Shemakha weaving, permit unlimited variation within the design—in sharp contrast to all shuttle weaving which necessitates regularly recurring repeats. But while the rug designer thus has unrestricted liberty, needs of the eye and the mind, further defined by habits of tradition and discipline, guide invention. A division into field and border is the basis of all rug design. The border serves, like the cornice on a building or the frame on a picture, to emphasize the limits, isolate the field, concentrate attention on it, and sometimes control the implied movements of the interior pattern. The value of a border had already been recognized by pottery painters in 4000 B.C. and is fully developed in rug patterns from Assyrian times on. Its function is so fundamental, logically and psychologically, that it cannot be successfully omitted.

The field may be decorated with an all-over pattern, a panel composition, or a medallion system. The all-over pattern may be of identical repeats, either juxtaposed or evenly spaced, though the latter, while common on textiles, is rare on carpets; or it may be of varied motives in a unified system, e.g., different plant forms of about the same size and in the same relation to each other, but even in this freest type of design it almost invariably

includes bilaterally balanced repetitions which agreeably, almost necessarily reflect the human bilateral equilibrium. The latter type of design is found most typically in formalized representations of the paradise parks or woods which are a feature of Persian palace plans. Another type of all-over design appears entirely free but is actually organized on systems of scrolling stems, notably on the east Persian carpets of the 16th–17th centuries.

The value of panel subdivisions for controlling patterns had been discovered by the Upper Palaeolithic period (c. 25,000 B.C.) in a simple rectangular version, and panel systems have been a basic form of design since 4000 B.C., when pottery painters were already devising varied systems. On carpets the lattice provides the simplest division of the field, often a diagonal lattice as on the embroidered carpet from Noin Ula, a scheme that appears on Sassanian capitals and in Coptic tapestries. But a characteristic field design of the court carpets of the Shah Abbas period, the so-called Vase carpet, is constructed from the ogee, a motive that becomes prominent in near eastern textile design in the 14th century. Simple rectangular panelling—really a large-scale check—is typical of one style of Spanish rugs of the 15th–16th centuries.

The most frequent medallion composition consists of a central panel of more or less elaborate construction in the centre of the field superimposed on an all-over design, but this is also often complemented with corner pieces, which are typically quadrants of the central medallion.

But multiple medallion systems also are developed, either a succession or a chain of medallions on the vertical axis; or two or more forms of medallions alternating in bands, a scheme typical of the Turkish ("Ushak") carpets of the 16th–17th centuries; or systematically spotted medallions which may or may not be interconnected, or may interlock when the scheme logically becomes an elaborate lattice.

Persian carpets of the great period (15th–17th centuries) commonly have multiple design schemes, that is, composition systems on two or more "levels." The simplest is the medallion superimposed on an all-over design, but more typical are subtler inventions such as two or three spiral stem systems, sometimes overlaid with large-scale cloud bands, the whole intertwining and mutually supplementary, but each independently conceived and individually carried to completion. The finer Vase carpets have double or triple ogival lattices set at different intervals ("staggered"), each with its own centre and tangent motives which also serve other functions in the other systems. What at first sight appears to be a great multiplicity of independent motives thus proves on careful exploration to be firmly controlled and logically distributed.

Occasionally stripe systems are used, either vertical or diagonal, but this conception is more natural to shuttle-woven fabrics, and probably, when employed in the free techniques of rug weaving, are imitations of textiles.

The border invariably consists of a minimum of three members: the main band, which can vary greatly in width in accordance with both the size of the rug and the elaborateness of the field design, and the guard stripes, a decidedly subordinate band on either side, really the borders of the border. These may be the same on both sides or different. But multiple border systems also are quite common, as on one of the Noin Ula carpets, very elaborate schemes having been developed in mosaic floors of the Roman period. Some of the greatest carpets, however, have the simplest border arrangements, while on certain types of commercially produced carpets of the late 19th and early 20th centuries meaningfully multiple and complex compositions were developed. The court designers of the 16th century developed many beautiful correlations of rhythm and accent between border and field.

Patterns.—Four main classes of motives are used: geometrical conventional, plant and illustrative. The geometrical repertoire is built up from variations and combinations of meanders, polygons, crosses and stars. Meanders, chiefly for borders, range from the simple serration which is ageless (actually already much used in the Upper Palaeolithic) to fairly complex hooked forms, characteristically the angular "running-wave" or "Greek-key,"

which is also very ancient. Such meanders typically constitute reciprocals, i.e., designs which form the identical shape in the positive and negative areas, and so when executed in contrasted colours can be alternatively interpreted; or differentiated reciprocals, the negative space created by the main motive having a different but destructive form, a type of narrow border well developed in early mediaeval textile design. Little trefoil reciprocals are used for guard stripes in the Caucasus, central Persia (so-called Polonaise) and in India. Chief among the polygons employed are the lozenge and the octagon. The Maltese cross is frequent, and the gamma cross (or swastika) is frequent. The purely geometrical stars are usually based on the cross or the octagon. Many of these motives, which are rudimentary and very ancient, may have originated in basket-weaving and the related reed-mat plaiting, for they are natural to both techniques, but in rug weaving they have survived chiefly in the work of central Asia, Asia Minor and the Caucasus, pile-knotted and flat-woven, whether tapestry or of the *Shenakhu* type.

One of the principal motives in the 16th and 17th century Persian carpets is the so-called arabesque, an ambiguous term that generally implies an intricate scrolling vine system that in Persian ornamental schemes (12th to 18th centuries) usually terminates in a lilylike blossom of two uneven and asymmetrical members meeting at a narrow acute angle, generally with a rounded lobe on one side underneath, and describing two curves in opposite directions which continue readily into further scroll systems. This highly individual form was well begun in China in the late Chou period (c. 600 B.C.), notably on a few bronze mirrors, and is beautifully developed during the Han dynasty (200 B.C.-A.D. 220). It does not appear in Persia, however, until the 12th century (on pottery and architectural stucco ornament), and its intermediate history has not been traced in either country, yet when it does emerge in Persian design the essential forms are so close to those that had been current in the far east more than 1,200 years before, a hiatus and reinvention seem improbable.

Directly traceable to China, on the other hand, are the cloud knot (or *'chi*) and cloud band or ribbon—both begun by the Han period at least and with a continuous history thereafter. The cloud ribbon first appeared in western Asia in Syrian silk design of the 7th century but was sporadic until the 13th century when it was reintroduced as an aftermath of the Mongol invasion and at this time it became associated with the three-ball motive, an astral symbol that goes back to Babylonia of the second millennium B.C. and referred to the sun, moon and planet Venus, decisive astral bodies in the west Asiatic cults. The combination moved from Syrian textile design into Asia Minor textile design with the Ottoman Turkish conquest in the 15th century and became typical of one group of 16th-17th century Turkish carpets.

The cloud band or ribbon, already skilfully used on book covers, manuscript illumination and in architectural faience, became important on 16th century carpets and was employed with especial elegance and skill by the Persian designers, and perhaps most beautifully in the Turkish court carpets which owed much to Persian inspiration, while the cloud knot or *'chi*, a feature of the court carpets of the time of Shah Abbas, was continued to the end of the 18th century.

A second major class of conventional motives dominant in a considerable range of carpet designs from Asia Minor to India, the palmettes, are of plant derivation, and are justifiably named in that they originated in Assyrian design as stylizations of the palm, a symbol of the vitalistic power, often, if not always, in relation to the moon. Moreover, many of the almost uncountable variations that developed through the centuries continued to refer directly to the palm. Others, however, also beginning early in the first millennium B.C., derived from the lotus blossom, a complementary figure since it was connected primarily with the fertility repertoire in relation to sun symbolism. Still others involved the symbolically closely related pomegranate, utilizing primarily the fruit while still others presented the general vitalistic emblem, the vine, this last built on the single leaf. The forms of all these four main types of palmettes found in the rug designs are directly descended from styles current in textile designs from

the 4th century, and are more or less modified by Chinese influences. These patterns in the 16th and early 17th centuries were beautifully and realistically elaborated, and blossoms like the Chinese peony sometimes compete with the more conventional lotus. The lanceolate leaf often associated with palmettes especially in east Persian designs, is also largely conventional.

Outstanding among the more naturalistic plants are the cypress and blossoming fruit tree, typically shown thus combined in Persian designs, still suggesting the ancient meaning of life eternal and resurrection. Willows are especially favoured in the Shah Abbas Vase carpet, as are jasmine flowers, and in Turkish court carpets, tulips. Many minor foliate and floral forms had no specific botanical identification though they give a realistic effect. Naturalistic red or pink roses, as on Karabagh and Kerman rugs from the 18th-19th centuries, are imitated from French patterns or English chintz and had no place in the old Persian repertoire, despite the importance of the rose in Persian poetry, life and even economy, and its ancient symbolic importance throughout western Asia as an alternative to the lotus blossom.

In one widely distributed class of design some of the plant forms grow out of a vase, a residue of an old symbolic complex, a cosmological tree, usually the Tree of Life, sustained by the Water of Life as implied by the "cloud-jar," a design already well developed in Babylon.

Of the illustrated motives, in addition to the naturalistic plants, the most important are those connected with the garden and the hunt: many small songbirds of which the nightingale meant most to the Persian; the *feng huang* (pheasant) taken over from China and much favoured in the 16th century and occasionally the peacock, which further west in Asia had had considerable symbolic value; the great felines—lions and the semiconventional lion-mask, sometimes used as the centre of a palmette; tigers; cheetahs; bear; fox; deer of numerous species; goats, sometimes picturesquely prancing; or the wild ass, a fleet prey; ferocious looking Chinese dragons and the gentle *hihm*, a fantastic equine likewise imported from China. Fish sometimes swim in pools or streams, or are conventionally paired to suggest an escutcheon in the borders of one type. Huntsmen, usually mounted, are the major human figures, though musicians and angels also occur (Austrian State Hunting carpet).

In the utilization of the conventional and illustrative vocabularies the underlying theme is nearly always fertility or abundance. These principles are magnificently embodied in the great carpet of Ardabil. A huge golden stellate medallion, the ultimate fulfillment of the multiple-pointed rosette that from immemorial time symbolized the sun, has at its very centre a little gray-blue pool on which are floating four lotuses, obviously representing the old notion of the atmosphere pool located in the depths of the heavens, from which comes the rain; the whole figure thus standing for the two basic vitalizing elements—sun and water. Out of this medallion, proof of its magical potencies, issues a complex system of tendrils and blossoms. The vitalistic power, the

theater of the Caucasus rugs are the lattice system (fig. 26), enclosing conventionalized flowers and foliage (figs. 23, 25), complex polygons (fig. 24) and radial rosettes (fig. 28), a cross pattern with foliation on the diagonal, also derived from early 16th century Persian carpets, a design that was developed from Assyrian times.

The finest of the Caucasus weavings are varied in colour, of clear and resonant tones, colours which tended to meagreness as the art degenerated toward the end of the 19th century.

RUHLA, a town of Germany, in the Land of Thuringia. Pop. (1933) 8,212. It stretches along the valley of the Erb 8 mi. S. of Eisenach, and attracts a number of visitors owing to its surroundings and its mineral springs. Its staple industry is the making of wooden and meerscham pipes; it also manufactures electrical apparatus, amber ware, watches and toys.

RUHNKEN, DAVID (1723-1798), one of the most illustrious scholars of the Netherlands, was of German origin, having been born in Pomerania in 1723. His parents had him educated for the church, but after two years at the University of Wittenberg he determined to live the life of a scholar. At Wittenberg Ruhnken lived in close intimacy with the two most distinguished professors, Ritter and Berger. To them he owed a thorough grounding in ancient history and Roman antiquities and literature; and from them he learned a pure and vivid Latin style. But neither at Wittenberg nor at any German university was Greek seriously studied, so Ruhnken went to Leyden, where, stimulated by the influence of Bentley, the great scholar Tiberius Hemsterhuis had founded the only real school of Greek learning which had

existed on the Continent since the days of Joseph Scaliger and Isaac Casaubon. At Leyden he became a close friend of Hemsterhuis, and when Hemsterhuis died in 1766 Ruhnken and his fellow-pupil Valckenaer carried on the tradition. With the exception of a fruitful year (1755) spent in the libraries of Paris, he spent the rest of his life at Leyden where he died in 1798.

Ruhnken's principal works are editions of (1) Timaeus's *Lexicon of Platonic Words*, (2) Thalelaeus and other Greek commentators on Roman law, (3) Rutilius Lupus and other grammarians, (4) Velleius Paterculus, (5) the works of Muretus. He also occupied himself much with the history of Greek literature, particularly the oratorical literature, with the Homeric hymns, the scholia on Plato and the Greek and Roman grammarians and rhetoricians. A discovery famous in its time was that in the text of the work of Apianes on rhetoric a large piece of a work by Longinus was embedded.

See Wyttchenbach, *Vita Ruhnkenii* (Leyden, 1799).

RUHR, a river of Germany, 142 mi. long, an important right-bank tributary of the lower Rhine. It rises on the side of the Wintenberg in the Sauerland, at about 2,000 ft. above the sea. It flows north and then west in a deep, well-wooded valley past the town of Arnsberg. Shortly after reaching Neheim it bends south-west, and courses through the important mining district of the Ruhr coalfield around Hagen. Hence in a tortuous course it passes Witten, Steele, Kettwig and Mülheim, and joins the Rhine at Ruhrort. The river is navigable from Witten downwards, by the aid of eleven locks. Its chief affluents are the Mähne (right) and Lenne (left).

French Occupation—Though the occupation of the left bank of the Rhine arranged for in the Treaty of Versailles included the bridgehead at Cologne, and thus practically touched the Ruhr district, the French were not satisfied from a military point of view, as the "Westphalian basin" was the hub of the German iron and steel industry. In March 1921 the French extended the occupation to Duisburg, Ruhrort and Düsseldorf, containing 5,000 sq. km. and 877,000 inhabitants, as a sanction for Germany's refusing the Paris reparations proposals; another 37,700 sq. km. with 3,191,000 inhabitants were occupied during 1923-24, when they controlled almost the entire Ruhr district.

Before World War I most of the Lorraine iron and steel works were owned by or closely affiliated with concerns in the Ruhr. The low grade iron ore of Lorraine, apart from the quantities used on the spot went to the blast furnaces of the Ruhr. Of 21,100,000 tons mined, 3,100,000 tons went to the Ruhr. On the other hand the coke of the Ruhr was needed for the smelting of Lorraine ores, while the finished iron and steel goods of Lorraine found their market in southwestern Germany.

The re-annexation of Alsace-Lorraine and the retirement of Luxembourg from the German customs union reduced Germany's home supply of iron ore to about 20% of its former size. At the same time France became the greatest iron ore producing country of Europe; moreover she controlled the well equipped iron and steel mills in Lorraine, expropriating the German iron and steelmasters. She also temporarily annexed the Saar mines, partly in the hope of getting coke for her iron industries. As the Saar coal did not coke well, special clauses were inserted in the Treaty of Peace, guaranteeing to France (and to the other Allies) a regular supply of the Ruhr coal and coke at statutory prices.

Political pressure apart, however, the German coalmasters held the winning hand. Compensation from the German government enabled them to erect new iron and steel works on the Ruhr, which could easily be run with high-grade Swedish or Spanish ore or with the enormous quantities of scrap available after the war. The low grade Lorraine ore, on the other hand, had either to be smelted locally or sent to the Ruhr. Smelting in Lorraine depended on the regular supply of Ruhr coke. And the export of finished products depended mainly on German markets which were open to France without duty for five years only (within the limits of Alsace-Lorraine's prewar sales to Germany). Thus those who controlled the Ruhr coal really controlled the Lorraine iron and steel industry.

As early as the Conference of Spa (1920) when Germany had

fallen short on coal deliveries, the Allies presented her with an ultimatum, which threatened the occupation of the Ruhr in case of non-acceptance. Though this extension of the area of occupation was an arbitrary act, the German Government gave way. From this moment the French began to use this threat of an extension of the occupation as a weapon in the struggle about reparation. When the German Government refused the proposals of the Paris Conference (Jan. 29, 1921) they occupied Düsseldorf, Ruhrort and Duisburg, and continued the occupation after Germany had accepted the London ultimatum of May 5, 1921.

On Dec. 26, 1921 the Reparation Commission under French pressure announced that Germany had fallen short on the delivery of 20,000 c.c.m. of boards and of 130,000 telegraph poles, the total averaging but a few million marks; a few days later a similar shortcoming in coal-deliveries variously estimated at 11 to 15.6%, was declared. Against the vote of the British delegates the Reparation Commission came to the conclusion that Germany's shortcomings had been "intentional" (*manquement volontaire*), constituting a case under Annex 11 § 18, which permitted the Allied and Associated Powers to take "such other measures as the respective Governments may determine to be necessary in the circumstances." The French and Belgian Governments decided to send a commission of engineers into the Ruhr, to control the activities of the Coal Syndicate and the carrying out of the deliveries as, in their opinion the coal mine owners were trying to sabotage the Treaty. This technical mission, in which Italy was to participate, but not Great Britain, was accompanied by a military force, though military occupation was not intended.

When the French and Belgian troops entered the Ruhr on Jan. 11, 1923, the Coal Syndicate had transferred their seat and their papers to Hamburg. The German Government issued a protest (Jan. 12, 1923): all reparation payments especially the delivery of coke and coal to France and Belgium ceased. Civil servants and railway officials were forbidden to obey orders from the occupying powers. The French tried to get hold of the proceeds of taxes and of government property. They controlled the distribution of coal and insisted on cutting timber. They expelled the German officials, railway servants and leading citizens and heavily fined or imprisoned resisters. They erected a customs frontier, dividing the occupied district from the rest of Germany, thus controlling and stopping exports and imports into unoccupied Germany. The aim of the German resistance was to prevent the French from getting coal and coke, whilst the French tried to cut the connection with unoccupied Germany and to paralyse the district's economic life.

The struggle for the Ruhr completely destroyed German finance and with it German currency. Passive resistance in the long run meant the withdrawal of all workers, starting with the railway men, from such productive and distributive processes as might help the army of occupation. This involved the maintenance of all persons out of work at the public expense. The Ruhr occupation was the deciding factor in the collapse of the mark.

Germany's various proposals for a settlement were not accepted by the French, nor were the various suggestions of the British. At last the new German Government, presided over by Stresemann, gave up passive resistance on Sept. 26. The French Government continued to refuse negotiations and strongly supported the separatist movement all over the left bank of the Rhine.

In Nov., 1923, the industrial concerns in the occupied districts negotiated an agreement with the *Mission Interalliée de Contrôle des Usines et des Mines* (called Micum) with the object of freeing the huge iron and coal stocks which had accumulated, as the French Government would not negotiate with the German Government. It demanded the payments of the German coal tax and the coal on the dumps, whilst the new output could be sold by the works against payment of a duty; the delivery of reparation coal and coke was to be resumed on a percentage basis of the total output. Iron and steel might be sold by the works against payments. The German Government (by letters of Nov. 1 and 21) acknowledged their obligation to refund the cost of payments of delivery to the industries concerned. They did so later on by paying the iron and coal firms 700,000,000 marks.

These provisional arrangements paved the way for peace, after British and American pressure had induced the French government to agree to the appointment of the Dawes committee by the Reparation Commission. The total payments realized from the Ruhr were 400,000,000 gold marks in cash and the value of 491,900,000 gold marks in goods, leaving a total balance—after deduction of 184,000,000 marks expenses—of 708,000,000 gold marks—or not a third of the minimum payment expected under the London ultimatum.

The new French Government was willing to accept the Dawes plan, to free the prisoners and to leave the Ruhr. The plan was formally signed on Aug. 30. Within the next two months administration, railways and government property were handed back to Germany. The evacuation of the Ruhr ended on July 31, 1925 when the French troops left Essen and Mülheim. On Aug. 25 the old occupied areas of Düsseldorf, Duisburg and Ruhrort were given back.

After political pressure ceased, the mere compulsory economic co-operation of the Treaty of Versailles came to an end. But the German industrialists had realized that France had held the winning cards in the political game, whilst the French Government began to understand the limits of military pressure in the economic field. The result was the Franco-German commercial treaty, and the Franco-German (international) iron-and-steel pact. The former secured French iron and steel goods a limited sale in German territory, to be effected through the German Steel Syndicate, whilst the ore and coal supplies were left to more or less private agreements. The latter combined French and German and Belgian steel works in an international syndicate, giving each country a fixed percentage of the total output.

The economic unity which the Treaty of Peace had destroyed, was thus being restored by extremely complicated measures, after a six years' struggle between governments and industrial groups, which cost much money and bloodshed. After Germany's entry into the League of Nations and the Locarno treaties the plan of using the Ruhr as an additional security became obsolete.

RUHRORT, after 1905 a part of Duisburg, in the Prussian Rhine province, Germany, at the junction of the Ruhr and the Rhine, in the midst of a productive coal district, 15 mi. N. of Düsseldorf and 12 mi. E. of Crefeld by rail. Ruhrort is first mentioned in 1379 and obtained civic rights in 1551. Having been in the possession of the counts of La Marck, it passed into that of Brandenburg in 1614. Ruhrort has one of the largest river harbours in the world, and it is the principal shipping port for the coal of the Westphalian coalfield, which is dispatched in the fleet of steamtugs and barges belonging to the port. The coal is sent ordinarily to south Germany and the Netherlands. Grain and timber are also exported and iron ore is imported. The industries of the former town include large iron and steel works, shipbuilding yards and tanneries. The area was heavily bombed during World War II.

RUIZ, JUAN (c. 1283–c. 1350), Spanish poet, became arch-priest of Hita. It may be inferred from his writings that he was not an exemplary priest, and one of the manuscript copies of his poems states that he was imprisoned by order of Gil Albornoz, archbishop of Toledo. It is not known whether he was sentenced for his irregularities of conduct, or on account of his satirical reflections on his ecclesiastical superiors. What seems established is that he finished his *Libro de buen amor* in 1343, while in gaol, and that he was no longer arch-priest of Hita in Jan. 1351; it is assumed that he died shortly before the latter date.

Ruiz is by far the most eminent poet of mediæval Spain. His natural gifts were supplemented by his varied culture; he clearly had a considerable knowledge of colloquial (and perhaps of literary) Arabic; his classical reading was apparently not extensive, but he knew by heart the *Disticha* of Dionysius Cato, and admits his indebtedness to Ovid and to the *De amore* ascribed to Pamphilus; his references to Blanchefleur, to Tristan and to Yseult, indicate an acquaintance with French literature, and he utilizes

the *fabliaux* with remarkable deftness; lastly, he adapts fables and apologies from Aesop, from Pedro Alfonso's *Disciplina clericalis*, and from mediaeval bestiarials. All these heterogeneous materials are fused in the substance of his versified autobiography, into which he intercalates devout songs, parodies of epic or forensic formulae, and lyrical digressions on every aspect of life. Ruiz, in fact, offers a complete picture of picaresque society in Spain during the early 14th century. From his Don Furón is derived the hungry gentleman in *Lasarillo de Tormes*, in Don Melón and Doña Endrina he anticipates Calisto and Melibea in the *Celestina*, and Celestina herself is developed from Ruiz' *Trotaconventos*. Moreover, Ruiz was justly proud of his metrical innovations. The *Libro de buen amor* is mainly written in the *cuaderna via* modelled on the French alexandrine, but he imparts to the measure a variety and rapidity previously unknown in Spanish.

See J. Puyol y Alonso, *El Arcipreste de Hita* (1906). (J. F.-K.)

RUIZ ZORRILLA, MANUEL (1834-1895), Spanish politician, born at Burgo de Osma. Deputy in 1856, he soon attracted notice among the most advanced Progressists and Democrats. After the military movement in Madrid of June 22, 1866, he had to flee to France, returning only at the revolution of 1868. In 1869 he became minister of grace and justice under Serrano; elected president of the House of Deputies in 1870, he succeeded Prim in offering the throne to Amadeus of Savoy. In 1871 he formed a cabinet, and continued to be the king's chief councillor until his abdication (Feb. 1873), when Ruiz Zorrilla advocated a republic. On the restoration of Alfonso XII. (1875), he went to France, where for nearly 18 years he was the soul of the republican conspiracies. He was eventually allowed to return to Spain and died at Burgos on June 13, 1895.

RUKWA (sometimes also Rikwa and Hikwa), a shallow lake in Tanganyika Territory, lying 2,650 ft. above the sea in a north-west continuation of the rift-valley which contains Lake Nyasa. The sides of the valley here run in steep parallel walls 30 to 40 m. apart, from south-east to north-west, leaving between them a level plain extending from about 7½° to 8½° S. This whole area was once covered by the lake, but this has shrunk so that the permanent water occupies only a space of 30 m. by 12, immediately under the east escarpment. In the rains it extends some 40 m. farther N., and the north of the plain is likewise then covered with water to a depth of about 4 ft. The rest of the plain is a bare expanse intensely heated by the sun in the dry season, and forming a tract of foul mud near the lake shores. The lake has two large feeders, the one from the west the Saisi, or Momba, rises in 8° 50' S., 31° 30' E., and traverses a winding valley cut out of the high plateau between lakes Nyasa and Tanganyika. The other chief feeder, the Songwe, rises in 9° 8' S., 33° 30' E. on the same plateau as the Saisi and flows north-west. The Songwe is joined by the Rupa. The maximum depth of the lake is about 10½ ft. Its water is very brackish and of a milky colour from the mud stirred up by the wind. It contains many fish.

RULE OF ST. BENEDICT: see BENEDICT OF NURSIA, SAINT.

RULE OF THE ROAD. This in Great Britain and Ireland is a matter of common law, otherwise custom, the origin of which is too remote for other than conjecture. The only statutory enactments dealing with the ordering of road traffic are the terms of the Highways Act of 1835, and those of the Motor Car Order of 1904. In the former it is laid down that all vehicle drivers must keep to the left side of the road when encountering other traffic. In the latter it is specifically ordered that drivers of motor vehicles, when meeting other traffic, must keep to the left, or near side of the road; and when passing any traffic proceeding in the same direction must keep to the off, or right side of it. Those seeking for a reason for the original choice have surmised that the left side was adopted because of the need on the part of drivers to have their whip hands free, which would not be the case on the narrow tracks and roads then existing if the right side had been selected. A more fanciful explanation was the wisdom, in turbulent times, of horsemen keeping that side of the road which would

admit of the sword arm being free in case of attack. But, while plausible, both leave unexplained why most other nations reversed the order, their traffic flowing along the right side of the road. On the Continent of Europe the right is the correct side for wheeled traffic in every country except Austria, Hungary, Portugal, Sweden, Czechoslovakia and Yugoslavia. In America the right is the correct order of the road for wheeled traffic.

Motors.—These differences, in view of the enormous increase of international road travel, due to the development of the motor vehicle, are becoming irksome and at times dangerous, and there is a growing desire to adopt a single universal rule. But the great disturbance and confusion inevitable in such radical change in the daily life of a nation makes the necessary surrender of its customs as disagreeable for one group as the other, and so, although discussions and proposals arise periodically, there seems to be little possibility of any agreement of the kind. Any change from the existing order would involve not only a corresponding reversal of traffic procedure, but the structural alteration of every motor vehicle in use. Experience has shown that where the left side of the road is the rule the driver must be seated on the right side of his vehicle in order that he may be the better able to keep his off-side front wheel clear of the traffic he is meeting; and, of course, the contrary holds when the right is the correct side.

Horses.—From the point of view of horse traffic the question of the adoption of a universal rule of the road in the various countries, though for obvious reasons this would appear desirable, is not so affected by considerations of safety as in the case of motor vehicles, since accidents due to forgetfulness on the part of drivers accustomed to pass on the opposite side are more easily avoided when travelling at the pace of a horse, and when they occur are likely to be less serious. It may be noted that although it is considered essential in motor vehicles that the driving seat should be on the side nearest to approaching traffic, it appears never to have been thought necessary so to construct horse carriages in countries where the rule of the road is the right; such countries are therefore at a disadvantage in this respect.

In civilian life it has always been customary for a horseman when riding one horse and leading another to ride with the led horse on his right or off side, the object being to allow full freedom to the left or bridle hand. Since it is desirable that the led horse should be on the side away from passing traffic, this obliges the rider to cross the road when a vehicle approaches and to pass it on the wrong side, a dangerous practice at any time, but more so now than formerly, owing to the naturally greater ignorance of present-day road travellers as to the ways of horses; moreover, the horseman, as he is contravening the rule of the road, has no redress in the case of accident. At night, especially, the practice of leading on the right is a very real danger, as it is then impossible to pass approaching vehicles on the off side, and the led horse, if frightened, may shy into the middle of the road and be struck by a passing vehicle before the driver is aware of any obstruction or has time to avoid it. In the army it has for some years been recognized that the ridden horse can be as well controlled by the right as by the left hand, and horses are now led on the near or left side, thus necessitating no change from the normal method of passing approaching traffic. (G. W.; X.)

American Practice.—The United States has departed from the common law inherited from England as to the basic rule of the road. The rule in the United States as in the greater part of Continental Europe and elsewhere, is to pass approaching traffic on the right hand side of the roadway, whether operating a motor vehicle or driving, riding or leading a horse or other animal. Canada has abandoned the left hand in favour of the right hand rule. Neither rule appears to have any outstanding physical advantage over the other, but where either has become firmly established many structural and equipment details and practices are based upon it. While for more than a decade right hand drive prevailed, virtually all American motor vehicles are now built with the driver's seat on the left side, thus enabling the driver to watch his clearance with approaching vehicles. Highway signs and automatic traffic signals are placed to be seen from the right hand side of the road. The American rule of the road is

also consistent with the practice on the street railways and nearly all the steam railroads.

The tremendous growth of motor transport in the United States has impelled the States and municipalities to lay down numerous rules specifically setting forth the application of the basic right hand rule in various situations. For example, a vehicle meeting another must give the other vehicle half the road. A vehicle may not overtake and pass another on sharp curves or hill crests and not unless there is space ahead of the overtaken vehicle to permit the overtaker to regain safely his own side of the road. The operator of the overtaken vehicle must on signal give the overtaker ample opportunity and must not increase his speed until the other vehicle has passed him completely. It has been assumed that the overtaken vehicle will normally be near the right hand edge of the roadway, but with the development of wide streets with several definite lanes of traffic in each direction, there has been a growing tendency of operators to keep toward the centre. A rule has therefore been developed requiring slow moving vehicles to keep as far to the right as possible.

One of the most essential and also most difficult rules of the road to define and enforce equitably is the right of way rule at intersections. The fundamental rule is that the vehicle which would first reach the common point has the right of way. Supplementary to this rule is a provision of wide prevalence requiring the vehicle on the left to yield to one on the right approaching the common point at approximately the same time. A further qualifying provision in some jurisdictions is that giving right of way to the vehicle which first entered the intersection. Other widely accepted provisions are those giving emergency vehicles the right of way over other vehicles regardless of relative position at an intersection; and the through street stop rule, which requires all vehicles to come to a full stop before entering certain thoroughfares designated for high-speed through traffic, and placing upon the cross traffic the same added burden of responsibility that is upon any vehicle starting from a position of rest.

Recognizing the danger, particularly at night, of pedestrians on highways without separate footpaths being run down by motor vehicles coming from the rear, it is regarded as generally safer for them to walk on the left side. A few States have passed laws requiring this. Such laws, however, would compel the pedestrian to walk where it is at times manifestly unsafe, as on the inside of a sharp curve, and virtually deny him right of way on any other part of the roadway. A vehicle turning to the right is generally required to keep close to the right curb or edge of the roadway, while, according to the prevailing rule, a vehicle turning to the left must do so from the traffic lane next to the centre line of the roadway. The most modern and approved speed restrictions embody a general prohibition against driving too fast for the conditions, together with *prima facie* limits, for the guidance of operators and enforcement officers, beyond which the apprehended operator must prove that he was driving safely. The *prima facie* limits are ordinarily graded from business districts to rural areas (A. B. B.)

RULE OF THE ROAD AT SEA. The principal nations have subscribed to the following regulations for preventing collisions at sea, and rules as to signals of distress.

Every steam vessel which is under sail and not under steam is to be considered a sailing vessel, and every vessel under steam, whether under sail or not, is to be considered a steam vessel. The word "steam vessel" shall include any vessel propelled by machinery. A vessel is "under way" within the meaning of these rules, when she is not at anchor, or made fast to the shore or aground.

Lights.—The word "visible" when applied to lights shall mean visible on a dark night with a clear atmosphere. The rules concerning lights shall be complied with in all weathers from sunset to sunrise, and during such time no other lights which may be mistaken for the prescribed lights shall be exhibited.

Lights for Steam Vessels.—A steam vessel when under way shall carry: (a) On or in front of the foremast, a bright white light, so constructed as to show an unbroken light over an arc of the horizon of 20 points of the compass, so as to throw the

light ten points on each side of the vessel, viz., from right ahead to two points abaft the beam on either side, and to be visible at a distance of at least five miles. (b) On the starboard side a green light to show an unbroken light over an arc of the horizon of ten points of the compass, so as to throw the light from right ahead to two points abaft the beam on the starboard side, and to be visible at a distance of at least two miles. (c) On the port side a similar red light. (d) The green and red side-lights shall be fitted with inboard screens projecting at least 3 ft. forward from the light, so as to prevent these lights from being seen across the bow.

(e) A steam vessel under way may carry an additional white light similar in construction to the light mentioned in subdivision (a). These two lights shall be so placed in line with the keel that one shall be at least 15 ft. higher than the other, and in such a position with reference to each other that the lower light shall be forward of the upper one. The vertical distance between these lights shall be less than the horizontal distance.

Towing Lights.—A steam vessel when towing another vessel shall, in addition to her side-lights, carry two bright white lights in a vertical line one over the other, not less than 6 ft. apart, and when towing more than one vessel shall carry an additional bright white light 6 ft. above or below such lights, if the length of the tow, measuring from the stern of the towing vessel to the stern of the last vessel towed, exceeds 600 feet.

Not Under Control.—A vessel which from any accident is not under command shall carry: if a steam vessel, in lieu of the white steaming light, two red lights, in a vertical line one over the other, not less than 6 ft. apart, and of such a character as to be visible all round the horizon at a distance of at least 2 m.; and shall by day carry in a vertical line one over the other not less than 6 ft. apart, where they can best be seen, two black balls or shapes each 2 ft. in diameter.

Telegraph Laying.—A vessel employed in laying or in picking up a telegraph cable shall carry in lieu of the white steaming light, three lights in a vertical line one over the other not less than 6 ft. apart. The highest and lowest of these lights shall be red, and the middle light shall be white, and they shall be of such a character as to be visible all round the horizon, at a distance of at least 2 miles. By day she shall carry in a vertical line one over the other, not less than 6 ft. apart, where they can best be seen, three shapes not less than 2 ft. in diameter, of which the highest and lowest should be globular in shape and red in colour, and the middle one diamond in shape and white.

The vessels referred to in the two former classifications when not making way through the water, shall not carry side-lights, but when making way shall carry them.

Lights for Sailing Vessels.—A sailing vessel under way, and any vessel being towed, shall carry the same lights as those prescribed for a steam vessel under way, with the exception of the white (steaming) lights which they shall never carry. Whenever, as in the case of small vessels under way during bad weather, the green and red side-lights cannot be fixed, these lights shall be kept at hand lighted and ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side nor the red light on the starboard side, nor, if practicable, more than two points abaft the beam on their respective sides.

Lights for Small Vessels and Boats.—Steam vessels of less than 40, and vessels under oars or sails of less than 20, tons gross tonnage, and rowing boats, when under way, shall not be obliged to carry the lights mentioned under sub-sections (a), (b) and (c), but if they do not carry them they shall be provided with the following lights:—

1. Steam vessels of less than 40 tons shall carry: (a) In the fore part or on or in front of the funnel, a bright white light constructed and fixed as prescribed for a steaming light, and to be visible at a distance of at least two miles. (b) Green and red side-lights to be visible for at least one m., or a combined lantern showing a green light and a red light from right ahead to two

points abaft the beam on their respective sides.

2. Vessels under oars or sails, of less than 20 tons, shall have ready a lantern with a green glass on one side and a red glass on the other.

3. Rowing boats, whether under oars or sail, shall have ready a lantern showing a white light, which shall be exhibited in sufficient time to prevent collision.

Lights for Pilot Vessels.—Pilot vessels, when engaged on pilotage duty, shall carry a white light at the masthead, visible all round the horizon, and shall also exhibit a flare-up light at short intervals, which shall never exceed fifteen minutes. On the near approach of or to other vessels they shall have their side-lights lighted and shall flash or show them at short intervals, to indicate the direction in which they are heading. A steam pilot-vessel carrying specially licensed pilots shall, in addition to the lights required for all pilot boats, carry at a distance of eight ft. below her white mast head light a red light visible all round for at least two m., and also the coloured side-lights required to be carried by vessels when under way. When at anchor she shall carry, in addition to the lights required for all pilot boats, the red light above mentioned, but not the coloured side-lights.

Lights for Fishing Vessels.—Fishing vessels and fishing-boats shall carry or show:

(a) Open boats, by which it is to be understood boats not protected from the entry of sea water by means of a continuous deck, when engaged in any fishing at night, shall carry one all-round white light. (b) Vessels and boats, except open boats when fishing with drift-nets, shall carry two white lights where they can best be seen. Such lights shall be placed so that the lower of these shall be in the direction of the nets, and both shall show all round the horizon for not less than three miles. (c) When line-fishing, vessels and boats, except open boats, shall carry the same lights as vessels fishing with drift-nets. When shooting lines, or fishing with towing lines, they shall carry the lights prescribed for a steam or sailing vessel under way respectively. (d) Vessels engaged in trawling, if steam vessels, shall carry in the same position as the white steaming light a tricoloured lantern to show a white light from right ahead to two points on each bow, and a green light and a red light from two points on each bow to two points abaft the beam on the starboard and port sides respectively; and below the tricoloured lantern a white light in a lantern to show a clear uniform and unbroken light all round the horizon.

If sailing vessels, shall carry a white light in a lantern, to show a clear uniform and unbroken light all round the horizon, and shall also, on the approach of or to other vessels, show a white flare-up light or torch in sufficient time to prevent collision.

(e) Oyster dredgers and other vessels fishing with dredge-nets shall carry and show the same lights as trawlers. (f) Fishing vessels and fishing-boats may at any time use a flare-up light in addition to the lights already prescribed. (g) Every fishing vessel and every fishing-boat under 150 ft., when at anchor, shall exhibit a white light visible all round the horizon for at least one mile.

Every fishing vessel of 150 ft. or upwards, when at anchor, shall exhibit a white light visible all round the horizon for at least one mile, and shall exhibit a second light as hereinafter prescribed for vessels of such length. Should any such vessel, whether under 150 ft., or of 150 ft. in length or upwards, be attached to a net or other fishing gear, she shall on the approach of other vessels show an additional white light below the anchor light in the direction of the net or gear. (h) If a vessel or boat when fishing becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall in daytime haul down the day-signal required by subdivision (k); at night show the light or lights prescribed for a vessel at anchor; and during fog, mist, falling snow, or heavy rain-storms make the signal prescribed for a vessel at anchor. (i) In fog, mist, falling snow, or heavy rain-storms, drift-net vessels attached to their nets, and vessels when trawling, dredging, or fishing with any kind of drag-net, and vessels line-fishing with their lines out, shall, if of 20 tons gross tonnage or upwards, respectively, at intervals of not more than one minute make a blast; if steam vessels, with the whistle or siren, and if sailing vessels, with the fog-horn, each blast to be followed by ringing the

bell. (j) Fishing vessels and boats of less than 20 tons gross tonnage shall not be obliged to give these signals; but if they do not, they shall make some other efficient sound signal at intervals of not more than one minute. (k) All vessels or boats fishing with nets or lines or trawls, when under way, shall in daytime indicate their occupation to an approaching vessel by displaying a basket or other efficient signal where it can best be seen. If vessels or boats at anchor have their gear out, they shall, on the approach of other vessels, show the same signal on the side on which those vessels can pass.

Vessel Being Overtaken.—A vessel which is being overtaken by another shall show from her stern to such last-mentioned vessel a white light or a flare-up light. If a lantern is used for this purpose, it shall be so screened that it shall throw an unbroken light for 6 points from right aft on each side of the vessel, so as to be visible for at least 1 mile. Such light shall be carried as nearly as practicable on the same level as the side-lights.

Lights for a Vessel at Anchor.—A vessel under 150 ft. when at anchor, shall carry forward, at a height not exceeding 20 ft. above the hull, a white light to show a clear, uniform and unbroken light visible all round for at least 1 mile. A vessel of 150 ft. or upwards, when at anchor, shall carry a similar light at a height of not less than 20, and not exceeding 40, ft. above the hull, and at such a height that it shall be not less than 15 ft. lower than the forward light, another such light. A vessel aground in or near a fairway shall carry the above light or lights and the two red lights prescribed for a vessel not under control. Every vessel may, if necessary in order to attract attention, in addition to the lights which she is by these rules required to carry, show a flare-up light or use any detonating signal that cannot be mistaken for a distress signal.

Special Lights.—Nothing in these rules shall interfere with the operation of any special rules made by the government of any nation with respect to additional station and signal lights for two or more ships of war or for vessels sailing under convoy, or with the exhibition of recognition signals adopted by shipowners, which have been authorized by their respective governments and duly registered and published.

A Steam Vessel Under Sail Only.—A steam vessel proceeding under sail only, but having her funnel up, shall carry in daytime, forward, where it can best be seen, one black ball or shape 2 ft. in diameter.

Fog-Signals.—Fog-signals shall be given:—

1. By steam vessels, on the whistle or siren. 2. By sailing vessels and vessels towed, on the fog-horn. A "prolonged blast" shall mean a blast of from four to six seconds.

A steam vessel shall be provided with an efficient whistle or siren, and with an efficient fog-horn, to be sounded by mechanical means, and also with an efficient bell. A sailing vessel of 20 tons gross tonnage or upwards shall be provided with a similar fog-horn and bell. In fog, mist, falling snow, or heavy rain-storms, whether by day or night, the following signals shall be used:—

(a) A steam vessel having way upon her, shall sound, at intervals of not more than two minutes, a prolonged blast. (b) A steam vessel under way, but stopped and having no way upon her, shall sound, at intervals of not more than two minutes, two prolonged blasts, with an interval of about one second between them. (c) A sailing vessel under way shall sound, at intervals of not more than one minute, when on the starboard tack one blast, when on the port tack two blasts in succession, and when with the wind abaft the beam three blasts in succession. (d) A vessel, when at anchor, shall, at intervals of not more than one minute, ring the bell rapidly for about five seconds. (e) A vessel, when towing a vessel employed in laying or in picking up a telegraph cable, and a vessel under way, which is unable to get out of the way of an approaching vessel through being not under command, or unable to manoeuvre as required by these rules shall, at intervals of not more than two minutes, sound three blasts in succession, viz.: one prolonged blast followed by two short blasts. A vessel towed may give this signal and she shall not give any other.

Sailing vessels and boats of less than 20 tons gross tonnage shall not be obliged to give these signals, but if they do not, they shall

make some other efficient sound-signal at intervals of not more than one minute.

Speed of Ships in Fog.—Every vessel shall, in fog, mist, falling snow, or heavy rain-storms, go at a moderate speed. A steam vessel hearing, apparently forward of her beam, the fog-signal of a vessel the position of which is not ascertained, shall, so far as the circumstances of the case admit, stop her engines, and then navigate with caution until danger of collision is over.

Steering and Sailing Rules to Avoid Collision.—Risk of collision can, when circumstances permit, be ascertained by carefully watching the compass bearing of an approaching vessel. If the bearing does not appreciably change, such risk should be deemed to exist.

Sailing Vessels.—When two sailing vessels are approaching one another so as to involve risk of collision, one of them shall keep out of the way of the other, as follows:—

(a) A vessel which is running free shall keep out of the way of a vessel which is close-hauled. (b) A vessel which is close-hauled on the port tack shall keep out of the way of a vessel which is close-hauled on the starboard tack. (c) When both are running free, with the wind on different sides, the vessel which has the wind on the port side shall keep out of the way of the other. (d) When both are running free, with the wind on the same side, the vessel which is to windward shall keep out of the way of the vessel which is to leeward. (e) A vessel which has the wind aft shall keep out of the way of the other vessel.

Steam Vessels.—When two steam vessels are meeting end on, or nearly end on, so as to involve risk of collision, each shall alter her course to starboard, so that each may pass on the port side of the other. The only cases to which this rule applies are those where by day, each vessel sees the masts of the other in a line, or nearly in a line, with her own; and, by night, to cases in which each vessel is in such a position as to see both the side-lights of the other. When two steam vessels are crossing, so as to involve risk of collision, the vessel which has the other on her own starboard side shall keep out of the way of the other.

Steam and Sailing Vessels.—When a steam vessel and a sailing vessel are proceeding in such directions as to involve risk of collision, the steam vessel shall keep out of the way of the sailing vessel.

General.—Where, by these rules, one of two vessels is to keep out of the way, the other shall keep her course and speed; but when, in consequence of thick weather or other causes, such vessel finds herself so close that collision cannot be avoided by the action of the giving-way vessel alone, she also shall take such action as will best aid to avert collision. Every vessel whose duty it is to keep out of the way of another vessel shall, if the circumstances of the case admit, avoid crossing ahead of the other.

Vessels Overtaking.—Notwithstanding anything contained in these rules, every vessel, overtaking any other, shall keep out of the way of the overtaken vessel. Every vessel coming up with another vessel from any direction more than two points abaft her beam, shall be deemed to be an overtaking vessel; and no subsequent alteration of the bearing between the two vessels shall make the overtaking vessel a crossing vessel within the meaning of these rules, or relieve her of the duty of keeping clear of the overtaken vessel until she is finally past and clear.

As by day the overtaking vessel cannot always know with certainty whether she is forward or abaft this direction from the other vessel, she should, if in doubt, assume that she is an overtaking vessel and keep out of the way.

Narrow Channels.—In narrow channels every steam vessel shall, when it is safe and practicable, keep to that side of the fair-way or mid-channel which lies on the starboard side of such vessel. Sailing vessels under way shall keep out of the way of sailing vessels or boats fishing with nets, or lines, or trawls.

Navigational Dangers.—In obeying and construing these rules, due regard shall be had to all dangers of navigation and collision, and to any special circumstances which may render a departure from the above rules necessary in order to avoid immediate danger.

Sound-signals for Vessels in Sight of One Another.—A "short blast" means a blast of about one second's duration.

When vessels are in sight of one another, a steam vessel under way, in taking any course authorized or required by these rules, shall indicate that course by the following signals on her whistle or siren:—

One short blast to mean, "I am directing my course to starboard." Two short blasts, "I am directing my course to port." Three short blasts "My engines are going full speed astern."

Proper Precautions.—Nothing in these rules shall exonerate any vessel, or the owner, or master or crew, from the consequences of any neglect to carry lights or signals, or of any neglect to keep a proper look-out, or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

Rules for Harbours and Inland Navigation.—Nothing in these rules shall interfere with the operation of a special rule, duly made by local authority, relative to the navigation of any harbour, river, or inland waters.

Distress Signals.—When a vessel is in distress and requires assistance from other vessels or from the shore, the following shall be the signals to be used or displayed by her, either together or separately:—

1. A gun or other explosive signal fired at intervals of about a minute; 2. The international code signal of distress indicated by NC; 3. The distant signal, consisting of a square flag, having either above or below it a ball or anything resembling a ball; 4. A continuous sounding with any fog-signal apparatus. At night:—1. A gun or other explosive signal fired at intervals of about a minute. 2. Flames on the vessel (as from a burning tar-barrel, oil-barrel, etc.); 3. Rockets or shells, throwing stars of any colour or description, fired one at a time, at short intervals; 4. A continuous sounding with any fog-signal apparatus. (E. A.)

RULHIÈRE (or RULHIÈRES), CLAUDE CARLOMAN DE (1735–1791), French poet and historian, was born at Bondy, near Paris, on June 12, 1735. He served Marshal Richelieu in the Hanoverian campaign of 1757, and during his government at Bordeaux in 1758. At St. Petersburg (Leningrad) where he was sent as secretary of legation, he witnessed the revolution which seated Catherine II. on the throne. In 1773 Rulhière became secretary to the future Louis XVIII.; in 1787 he was admitted to the Academy. He lived chiefly at Paris, where he held an appointment in the Foreign Office. He died at Bondy on Jan. 30, 1791. He befriended J. J. Rousseau in his old age.

Rulhière's historical works include *Histoire de l'anarchie de Pologne* (4 vols., 1807), edit. P. C. F. Danon; and *Éclaircissements historiques sur les causes de la révocation de l'Édit de Nantes* (2 vols., 1788).

RULLUS, PUBLIUS SERVILIUS, a Roman tribune of the people in 64 B.C., well known as the proposer of one of the most far-reaching agrarian laws brought forward in Roman history. This law provided for the establishment of a commission of ten, empowered to purchase land in Italy for distribution amongst the poorer citizens and for the foundation of colonies. The commission was to be invested with praetorian powers, and Pompey, then in the East, was excluded by a provision that personal attendance was necessary to election. In fact, the commission as a whole was intended to act as a counterpoise to his power. There were provisions for the purchase of further land by the sale of recently conquered territory and the use of the revenues from Pompey's provinces. The places to which colonies were to be sent were not specified, so that the commissioners would be able to sell wherever they pleased, and it was left to them to decide what was public or private property. Cicero delivered four speeches against the bill, of which three are extant. It was not greeted with enthusiasm and was dropped before the voting. The whole affair was obviously a political move, probably engineered by Caesar, his object being to make the democratic leaders the rulers of the state. Although Caesar could hardly have expected the bill to pass, the aristocratic party would be saddled with the odium of rejecting a popular measure, and the people themselves would be more ready to welcome a proposal by Caesar himself, an expectation fulfilled by the passing of the *lex Julia* in 59, whereby Caesar at least partly succeeded where Rullus had failed.

See the orations of Cicero *De lege agraria*, with the introduction in

G. Long's edition, and the same author's *Decline of the Roman Republic*, iii, p. 241; Mommsen, *Hist of Rome*, bk. v, ch. 5; art. *AGRIARIAN LAWS*.

RUM or **ROUM**, an indefinite term in use among Mohammedans at different dates for Europeans generally and for the Byzantine empire in particular; at one time for the Seljuk empire in Asia Minor, and now for Greeks inhabiting Ottoman territory (Arab. *ar-Rûm*). When the Arabs met the Byzantine Greeks, these called themselves *Ῥωμαῖοι*, or Romans, so the Arabs called them "the Rûm" as a race-name (already in Qur xxx, 1), their territory "the land of the Rûm," and the Mediterranean "the Sea of the Rûm." Later, inasmuch as Moslem contact with the Byzantine Greeks was in Asia Minor, the term Rûm became fixed there geographically and remained even after the conquest by the Seljuk Turks, so that their territory was called the land of the Seljuks of Rûm.

RUM is the potable spirit obtained by distillation of the fermented products of the sugar cane. Its source is principally the West Indies, where it originated, but there is a considerable production in the United States and it is produced in most sugar cane growing areas.

Rum (the origin of the name is uncertain) has a characteristic flavour which some people consider to be derived from the esters in the spirit but which has later been thought to be derived from the presence of a rum oil. The quantity and type of the esters and other secondary constituents vary according to the process of manufacture, of which there are numerous modifications. Thus, the raw materials may vary from fresh cane juice to skimmings and exhausted molasses, and the fermentation may be rapid or prolonged. Modern methods of manufacture with consequent closer control of fermentation and distillation produced marked improvement in the efficiency of the processes involved. The Sugar Industry commission of Jamaica, 1945, indicated that such improvements might profitably be extended in that island.

Jamaican Rum.—This spirit, made by a time-honoured process, is the product of the fermentation of the scum and washings from the boiling of cane juice together with primary molasses and "dunder," which is the residue left in the still from a previous distillation. The scum is allowed to sour, this being assisted by the addition of a small quantity of the fibrous residue (megasse) of the crushed cane. The other ingredients are added with water in proportions determined by the distiller to give a wash of specific gravity 1.072-1.096 and the whole is allowed to ferment over a period of 6 to 12 days or longer. Distillation from a pot still follows. Later practice involves the separate initial fermentation of part of the wash before its addition to the main bulk.

Jamaican rum is not produced at strengths exceeding 45° over proof and receives no additions other than caramel for colouring. There are two grades, one the usual drinking rum, the other a high ester rum for blending and the production of factitious rum.

Demarara Rum.—Practically the only raw material used in making Demarara rum is molasses, from which a slightly acid wash of specific gravity 1.065 is prepared by the addition of 1 pt. of sulphuric acid and 1 lb. of ammonium sulphate to 100 gal. of diluted molasses. The acidity checks the growth of undesired organisms and the ammonia provides yeast food, all designed to assist a rapid fermentation, which is complete in 48 hr. Both pot and patent stills are used for the distillation, the intention being to obtain a high yield of alcohol whose ester content, particularly higher esters, is low. Some Demarara spirit is subsequently flavoured.

United States Rum.—The only raw material used is blackstrap molasses from which a wash of definite acidity is prepared and fermented with pure culture yeast. Light rums of slight rum flavour are distilled at 190° American proof, broken down to just over proof and rapidly aged with oak chips. Heavier-bodied rum is distilled at 160° American proof and stored in oak barrels to age, whereby acids, esters, solids and colour are increased.

Other Rums.—Materials and methods of making rum in Cuba and Puerto Rico follow the U.S. pattern, Cuban rum being finally purified by filtration through charcoal to produce an almost neutral spirit which is subsequently flavoured.

Imitation rum is produced by flavouring a neutral spirit (obtained from grain, potatoes or beets) with high-ester Jamaican

rum or with artificial essences. Originally manufactured in Europe, largely in Germany, its importation into Great Britain had practically ceased by mid-20th century. By customs order, 1891, entry was not allowed except as imitation rum, the title rum being reserved for spirits coming from ports in sugar-cane areas.

Pineapple rum, flavoured by the addition of the sliced fruit to the wash, and Negro rum made from sugar-cane refuse are potable. Bay rum is a spirituous perfumed hairwash made by dissolving oil of pimento (bay oil) in strong rum.

Rums may contain from 43% to 79% by volume of ethyl alcohol at importation. Other constituents, expressed as parts per 100,000, vary widely. (J. G. N. G.)

RUMANIA, or **RÖMANIA**, a nation of southeast Europe to the north of the Balkan peninsula. Its area within the boundaries established after World War I covered 113,889 sq.mi., with a population of 18,025,237 at the census of 1930. In 1940 Rumania lost about a quarter of its territory. After the peace treaty of 1947 the estimated area was 91,671 sq.mi. and the population (census of 1948) 15,872,624.

RUMANIA AFTER WORLD WAR II AND THE PEACE TREATY OF 1947

PHYSICAL FEATURES

Rumania is a land of great contrasts and contains within its boundaries examples of most of the physiographical regions characteristic of the European continent. Of the total area within the 1947 boundaries, mountains occupy 26%, hills 39% and plains 35%.

The Carpathians form the predominant feature of Rumania. They run in a great arc from the junction of the Hungarian and U.S.S.R. frontiers in the north, in the districts of Maramures and Bukovina, to the junction of the Yugoslav and Bulgarian frontiers in the south. Within the arc lie the related Bihorului mountains, forming the core of Transylvania and distinguishing it from the plains of Hungary. These great ranges of alpine-fold mountains, which run in a continuous zone from the Danube river at Bratislava in Czechoslovakia to the Danube at the gorge of the Iron Gate in Rumania, form a link between the Alps proper and the Balkan ranges of Yugoslavia and Bulgaria.

In Rumania the mountains are characterized mainly by their penetrability. The rivers, which drain entirely toward the Danube, by cutting back into the numerous upland basins (e.g., that of Brasov) provide routes linking the hills and plains on either side. Most of the summits are remarkably uniform in height, and the formation of what is almost a plain has resulted in gently rounded plateaus, forming the *platou* (way) or high alpine meadows above the deep forest-shrouded upper valleys. Sharp mountain peaks, such as those of the Fagaras mountains, are more the exception than the rule. One Danube tributary, the Olt, has, by cutting a narrow gorge, succeeded in crossing from the Transylvanian to the Walachian side of the Carpathians. Apart from the Olt, the other tributaries that drain southward to the Danube are the Jiu, the

Dambovia on which stands the capital Bucharest (Bucuresti) and the Iulomita. The eastern slopes of the Carpathians drain into the Siret (with its tributary, the Bistritza) and the Prut which join the Danube a little above its delta. The interior basins of Transylvania, together with the inner slopes of the Carpathians and the Bihorului mountains, are drained westward by a complicated network of headstreams which feed the Tisza (Tisa) and two of its major tributaries, the Somes and the Mures. One other river, the Timis, makes its way independently of the Tisza reaching the Danube at Belgrade.

Two crystalline massifs, composed mainly of granite and schist, form the northern and southern ends of the Carpathians in Rumania. They are, in the north, that of Bukovina-Maramures running northwest to southeast with summits usually reaching from 5,400 ft. to 6,400 ft. (Pietros is 7,568 ft.); in the south that of Banat-Transylvania, generally known as the Transylvanian Alps, running east-west and reaching over 7,400 ft. at many points. The highest peak in Rumania is Nego (8,346 ft.) in the Fagaras mountains. Between these two terminal bastions, and linking them, is a somewhat lower north-south group, the Moldavian Carpathians, in which the so-called Flysch (folded and fractured sandstones, etc.) predominates. Along the inner edge of the ranges there are numerous examples of volcanic intrusions; e.g., the rocks forming the Caliman mountains in Maramures. The Bihorului mountains (about 6,000 ft.) are composed of both crystalline and volcanic rocks and show the rounded characteristic of the Rumanian ranges.

Within the arc of the Carpathians and abutting against the hard core of the Bihorului mountains lie the Tertiary rocks of the Transylvanian basin, a much-folded upland basin of sandstones and clays eroded into a country of hilly relief by the mountain-fed streams, the soft banks of which are much given to landslides. The outer edge of the mountain belt is ringed by the sub-Carpathian foothill zone bordering Moldavia and Walachia. The latter is subdivided into two smaller divisions by the Olt river, Oltenia to the west, Mutenia to the east. The foothills, composed of folded sedimentary rocks which provide the famous oil-bearing strata, afford one of the most verdant regions of the whole country.

The general accessibility of the Carpathians, which are crossed by numerous passes provided usually by low cols between the gently rounded mountain summits and often approached by upland basins, provides a contrast to the alpine-fold mountains elsewhere. In Rumania the mountains are not only crossed at many points, but actually form a well-populated region; with Transylvania they formed the cradle and refuge of the Rumanian nation above the tides of conquest that swept back and forth along the Danube plains and across the plains of northern Europe.

The most important passes—those followed by railway lines—are: (1) the Caransebes corridor leading from Timisoara to Orsova at the Iron Gate by way of the Porta Orientalis; this is an alternative to the Orient Express route; (2) the Olt gorge and the Red Tower (Turnu Rosu) pass leading from Oltenia to Transylvania; (3) the Predel pass (3,445 ft.) linking Brasov with Ploesti and Bucharest, joining Muntania (Greater Walachia) and Transylvania—the Orient Express route; (4) the Ghimes pass linking lower Moldavia and Transylvania and (5) the Bargau pass (3,940 ft.) linking Jassy (Iasi) in northern Moldavia and Chernovtsy (Cernauti), U.S.S.R. (a Rumanian city until 1940), with northern Transylvania.

The lowlands of Walachia and Moldavia consist in reality of plateaus of various elevations composed of horizontal or slightly tilted sedimentary strata of the Tertiary period, overlaid by a covering of recent deposits. These recent deposits, particularly in Moldavia, consist largely of the wind-borne loess, from which the rich black earth, or chernozem, soils are derived. The plateaus are crossed by the rivers descending from the Carpathian mountains. These streams are often deeply entrenched into the general level and are usually dry in the late summer when acute droughts are common. The Danube itself flows in a broad flood plain known as the Balta, characterized by numerous swamps and abandoned arms of the river, between bluffs marking the edge of the plateaus and the edge of the sub-Balkan platform of Bulgaria.

The Dobruja (Dobrogea), a unique region forming part of the sub-Balkan platform, consists of a core of folded crystalline rocks which are exposed in the northern hills (up to 1,300 ft.), but mainly concealed by a layer of chalk and recent deposits of loess. Dry valleys resembling the wadies of northern Africa dissect this hill region, which by its northward projection accounts for the diversion of the Danube in its lower course.

Climate.—Because Rumania is one of the more southerly European countries—the 45° N. parallel dissects the Danube delta—it is to be expected that it would experience high temperatures and much sunshine in summer. Atlantic influences, however, are remote (Bucharest is 26° E.). A great diurnal and seasonal range of temperature and a continental distribution of precipitation (with a marked early summer maximum) are characteristic of the whole country. The marked variations of relief have a great effect on climate; the plains of Moldavia and Walachia are essentially steppe-like with less than 20 in. of rainfall a year, cold winters and hot summers, while the Carpathian foothills have enough rainfall to support verdant forests and enjoy slightly more temperate conditions. The Carpathian zone receives a much greater precipitation than the other highland districts of the country, and is much cooler. It has some of the heaviest snowfalls of Europe. Transylvania, although higher and mountain-fringed like the Hungarian basin, has a noticeably harsher climate than the other hill regions, and is not so suited to the ripening of maize and the warmer fruits.

The year is divided into three seasons—winter, summer and autumn. The winters are long, often with much snow, and unpleasant when the northeast wind (the *civrot*) brings severe conditions from the Russian steppes. Summer can be of tropical intensity; a feature of this season is the southwest wind (the *austru*) which sometimes brings oppressive weather. Late summer is occasionally accompanied, especially in the Moldavian and Walachian plains, by severe drought; if this is combined with excessively low winter temperatures it produces famine conditions like those that arose in 1947. Autumn is the most temperate and enjoyable season of the year.

Data for Bucharest taken from a representative year illustrate these general conditions: with a mean annual range of temperature between 26.6° F. (January) and 71.6° F. (July), Bucharest recorded absolute extremes of -11.2° F. and 102.2° F. There were 78 days with frost and an equal number with tropical heat; one-third of the days were cloudless, one-third partly overcast and one-third sunless.

Fauna.—In its fauna, Walachia has far more affinity to the lands lying south of the Danube than to Transylvania, although several species of *Claudilia*, once regarded as exclusively Transylvanian, are found south of the Carpathians. Moldavia and the Baragan steppe resemble the Russian prairies in their variety of molluscs and the lower kinds of mammals. More than 40 species of fresh-water mussels (Unionidae) have been observed in the Rumanian rivers. The lakes of the Dobruja likewise abound in molluscs—parent forms, in many cases, of species which reappear greatly modified, in the Black sea. Insect life is somewhat less remarkable; but besides a distinctive genus of Orthoptera (*Jaqueia hospodar*), there are several kinds of weevils (Curculionidae) said to be peculiar to Rumania. Birds are numerous, including four varieties of crows, five of warblers, seven of woodpeckers, eight of buntings, four of falcons and five of eagles, while among the hosts of waterfowl which inhabit the marshes of the Danube are nine varieties of ducks and four of rails. Roe deer, foxes and wolves find shelter in the forests, where bears are not uncommon. Chamois frequent the loftiest and most inaccessible peaks.

(G. W. S.)

HISTORY

The early history of the lands which constitute modern Rumania, down to the end of the period of Roman domination, is traced in the article DACIA. Roman rule in Dacia lasted for 163 years. The legions were finally withdrawn south of the Danube in 271 A.D. by the emperor Aurelian. From the 3rd to the 12th century wave after wave of barbarian invaders from the east passed over the undefended country—first came the Goths and

Gepidae, then Slavs, followed by the Avars (*q.v.*), and in the second half of the 7th century by the Bulgars. The Bulgarian domination, lasting for two centuries, allowed a rudimentary civic life to take shape, and it was the Bulgars who, after the conversion of their tsar Boris in 864, brought Christianity in its eastern form to the ancestors of the Rumanians, building on earlier Latin foundations (see *Religion* below.) At the end of the 9th century the Bulgars were overcome by the Magyars; later came a brief incursion by the now almost vanished Petchenegs and Cumans (*qq.v.*).

One school of historians maintains that the Daco-Roman population north of the Danube was obliterated during these invasions and that the Rumanians of today are descended from Vlach tribes south of the river who pushed northward in the early 13th century. The Rumanian view, supported by linguistic and other evidence, is that the Roman withdrawal affected only the military and official classes, while the body of the Daco-Roman inhabitants were driven by the invaders into the Carpathians, becoming the Vlachs of Transylvania. The Macedo-Romans south of the Danube, later known as Kutso-Vlachs, similarly sought shelter in the Pindus mountains. The controversy is considered in the article *VLACHS*.

Transylvania, regarded by Rumanians as the cradle of their nation, was conquered in the 11th century by King Stephen of Hungary, but all records of its early inhabitants were destroyed in the Mongol invasion of that country in 1241. The authentic history of the Vlachs does not begin until the end of the 13th century, when they are found establishing themselves south of the Carpathians in the two distinct groups, one settling in the area later known as Walachia (called Muntenia by the chroniclers) and the other to the east in Moldavia. The incoming Vlachs fused with a population that already contained a Vlach element, but consisted mainly of Slavs and Tatars with an admixture of Petchenegs and Cumans.

The two regions thus colonized became the principalities of Walachia and Moldavia, whose annals remain distinct until 1774, but can thereafter be combined in one narrative, the Turkish administration being uniform. In 1859 the two principalities were formally united under the name of Rumania. The historical narrative which follows is therefore arranged under four headings, *Walachia, Moldavia, The Danubian Principalities and Rumania*.

VALACHIA

Tradition, embodied in a local chronicle of the 16th century entitled "History of the Ruman land since the arrival of the Rumanians" (*Istoria terei Românești de cându au descălecat România*) gives 1290 as the date of the founding of the Walachian state, asserting that in that year a voivode (prince) of Pagaras in southern Transylvania crossed the mountains with a body of followers and established himself at Campulung in the foothills, moving later to Curtea de Argeș. The name given for this first leader, Radu Negru (Ralph the Black), is probably a confusion with that of a later Walachian voivode, but the southward movement at that period of Vlach peoples from the mountains to the Danubian plain can be affirmed with certainty. Walachia itself was known to its own people as Muntenia, land of the mountains, after their former home. Historians who deny the continuity of Daco-Roman (Vlach) settlement in Transylvania have to postulate a northward migration of Vlachs from across the Danube to the Carpathians at the beginning of the 13th century to account for the indisputable southward movement at its close. The seeking of a new home in the south was due to the consolidation of Hungarian feudal power in Transylvania and of the feudal system, to the arrival of German settlers and to the growing proselytizing zeal of the Hungarian kings as faithful servants of the papacy. The Vlachs, since the introduction of organized Christianity under Bulgarian influence, had belonged to the Eastern Orthodox Church, taking the Byzantine side against Rome in the schism of 1054, though later some of their leaders came under Roman influence. (See also *Religion* below.)

The new principality remained at first under the domination of Hungary, but the voivode Bassarab defeated the Hungarian king Charles Robert in 1330 and secured independence. Vladislav (c. 1360-74), although again defeating the Hungarians, accepted a form of Hungarian suzerainty in return for investiture by Louis

the Great, Charles Robert's successor, with the banat (frontier province) of Severin and the duchy of Olmas.

The early days of the principality were conditioned by the struggle against Hungary, but with the reign of Mircea the Old (1386-1418) a new period began, that of the struggle against the Turks. The first voivodes of Walachia, in search of help against Hungary, had contracted matrimonial and military alliances with the two Slav states south of the Danube, Bulgaria and Serbia, but both empires were already at the point of extinction at the hands of the Turks. Tradition recounts that a Walachian contingent helped the Serbs at the battle of Kosovo in 1389; it is a fact that the sultan followed up his victory by invading Walachia, which first appears in 1391 as a tributary of the Sublime Porte. The final overthrow of Bulgaria in 1393 left Walachia open to further Turkish advance but Mircea succeeded in holding the invaders back on the Danube marshes in 1394, and in the following year made an alliance with Hungary. The joint Christian forces, which included French and Burgundian contingents, were defeated in 1396 at the battle of Nicopolis (Nikopoli). Mircea had thrown over an earlier alliance with Poland in order to secure one with Hungary; accordingly the Poles, taking advantage of the defeat at Nicopolis, intrigued for his deposition and replaced him by his son Vlad, who accepted Polish suzerainty. Mircea later returned, re-established, and for a time increased, his power by exploiting the quarrels between the sons of the sultan Bayazid. In 1417, however, Walachia was forced to capitulate to Turkey under Sultan Mohammed II, though its dynasty, territory and Christian religion were left intact. Mircea died a year later.

Early Years of Turkish Rule.—After Mircea's death, Walachia, convulsed by internal struggles, could take no active part against the Turks, but they were for a time again driven back by the Hungarians under the brilliant John Hunyadi (*q.v.*), a Rumanian by race though enrolled in the Hungarian nobility. He deposed one of the weak Walachian voivodes and nominated Vlad IV—who in 1456 acknowledged Hungary as suzerain—a man whose unbelievable cruelties earned him the name of "the Impaler" (Tepeș). Vlad (1456-62 and 1476-77) was able briefly to defy the Turks; with his death, resistance crumbled rapidly, Walachian voivodes succeeding one another after very short reigns.

The instability of the throne was in part due to the mixture of the hereditary and elective principles in the system of succession; the council of boyars (nobles), which came under Turkish rule to be known as the divan by analogy with the Turkish institution of that name, chose the prince from legitimate and illegitimate heirs of his dead predecessor.

The only voivode of the 16th century deserving mention is Neagu Bassarab (1512-1521), who founded cathedrals at Curtea de Argeș (*q.v.*) and at Targoviste, which had become the Walachian capital, and endowed monasteries in Walachia, besides making noble contributions to Mount Athos. The patriarch of Constantinople honoured the dedication of the Arges monastery with his presence.

Neagu's son and successor was imprisoned by the Turks who proceeded to nominate Turkish governors in the towns and villages of Walachia. The Walachians resisted desperately. They elected Radu, a kinsman of Neagu, as voivode and defeated the Turkish commander Mahmud Bey with Hungarian help at Grumatz in 1522. The continuance and extension of Turkish control became inevitable, however, after the crushing defeat of Hungary in 1526 at the battle of Mohacs.

Walachia thereafter became a line of communication for Turkish expeditions against Hungary and Transylvania. The voivode Alexander, who succeeded in 1591, actually farmed out his possessions to his Turkish supporters, and it seemed that Walachia must succumb to direct Ottoman rule.

Michael the Brave, 1593-1601.—The Turkish advance was once more to be halted, though for the last time, under a new voivode, Michael, son of Petrusko, ban of Craiova. He secured the deposition of Alexander and his own election by raising a loan at Constantinople of 400,000 ducats to make the customary presents to the Porte and was supported by Sigismund Bathory (*q.v.*), prince of Transylvania, and by the English ambassador at Con-

stantinople, Edward Barton. Michael was to prove a thorn in the flesh to the Turks, but was much criticized for making Walachia once more subject to Hungarian princes in return for their help. In concert with the Moldavian voivode Aaron, Michael organized a massacre of Turkish guards and settlers (Nov. 1594) and with the support given by Bathory in return for the acknowledgment of his suzerainty proceeded to invade Turkish territory, taking Ruschuk, Silistra and other places on the right bank of the Danube. A simultaneous invasion of Walachia by a large Turkish and Tatar host was defeated at the battle of Mantin (1595). The sultan next sent Sinan Pasha the Renegade to invade Walachia with 100,000 men. Michael withdrew to the mountains, but with aid from Bathory and a Transylvanian contingent resumed the offensive and stormed Bucharest, pursuing the main body of Sinan's forces to the Danube. In 1597 the sultan, wearied with these defeats, reinvested Michael for life.

Walachia's subjection to Hungary was not permanent. On the abdication of Sigismund Bathory, Michael, with the support of the emperor Rudolf II, attacked and defeated his successor Andreas Bathory in Oct. 1599 and had himself proclaimed prince of Transylvania, being acknowledged by the emperor as his lieutenant and having his position ratified by the diet. The Vlach peasant population of Transylvania was encouraged to revolt against the Magyars by having an overlord of their own race, but Michael, whose support in Walachia rested on the boyars, helped the Magyar nobility to suppress the peasant rising. Despite this the Magyars distrusted Michael, both as a despised Vlach and as a Habsburg agent, and he found his position in Transylvania insecure while Moldavia remained as a centre for Magyar and Polish intrigue. In May 1606 he invaded that principality, deposed the voivode and without waiting for the emperor's sanction had himself proclaimed "prince of all Ungro-Vlachia, of Transylvania and of Moldavia."

Though Rudolf confirmed Michael in his appointment he grew suspicious of his vassal's progress and determined to undermine his position. The imperial commissioner, Gen. George Basta, was instructed to give support to the disaffected Magyar element in Transylvania, and Michael was driven out by a successful revolt. At the same time the Poles invaded Moldavia, and restored the unseated voivode, while Walachia itself was also attacked. Michael appealed to the emperor, who restored him to favour, and in conjunction with Basta he defeated the Transylvanian forces at Goroslau in 1601. Basta, however, jealous of Michael's returning prosperity, procured his murder almost immediately after their joint victory.

Michael the Brave (Mihai Viteazul) is the leading Rumanian national hero, partly because it was he who made the last stand before the era of Turkish and Greek domination, but chiefly because for the first time since Dacian days he brought all the Rumanians, scattered in three principalities, under one rule, thus weaving the stuff of the national dream which was not to become reality until 1918.

The Period of Greek Penetration, 1634-1711.—After Michael's death Radu Serban of the Bassarab dynasty was appointed voivode of Walachia by the emperor's wish, but was deposed by the Turks in 1611. A succession of insignificant puppet princes followed him, the Greek element becoming increasingly apparent. There was a temporary rally in the second quarter of the 17th century under Matthias Bassarab, who succeeded in holding the throne for 22 years—warding off repeated attacks from his rival Basil the Wolf of Moldavia—and did much for the arts and the endowment of churches. He founded a printing press at the Govora monastery which issued a compendium of canon law, *Pravila cea mica*, the first Rumanian book to be printed in the principalities (Gospels in Rumanian had been printed in the preceding century by the Protestants in Transylvania).

The successor of Matthias, Constantine Serban, was the last Bassarab to rule in Walachia. On his death the Turks, who in 1698 moved the capital to Bucharest—at a safer distance from the Transylvanian frontier—began to exercise a more direct influence over the ruling families, who were now frequently of Greek origin. Serban Cantacuzino (1698-88), the first important Greek voivode, was an able man; forced to assist the Turks at the siege of Vienna,

he opened up secret communications with the emperor, who granted him a diploma creating him a count of the empire and recognizing his descent from the imperial house of Cantacuzino. In 1688, the year of Serban's death, the first Rumanian Bible was printed.

Serban's successor was his nephew Constantine Brancovan (Brancoveanu), descended on his mother's side from the Bassarabs, who pursued a policy of cautious balancing between the Porte, the emperor, Poland and the rapidly westward-thrusting Russia. Brancovan sent congratulations to Peter the Great on his victory at Poltava and asked for help for the Christian cause. Finally falling a victim to intrigues, Brancovan was deposed and executed at Constantinople in 1714.

The Phanariot Regime, 1714-1821.—At the beginning of the 18th century Turkish power was in obvious decline and the strength of Austria and Russia growing. Alarmed by the intrigues of Brancovan of Walachia and Cantemir of Moldavia with Vienna and Moscow, the Porte decided to exercise direct control over the principalities. Instead of reducing them to mere pashaliks, however, the Turks employed Greeks from the Phanar district of Constantinople as their agents. The new princes, or hospodars, insecure of tenure, had to extract the maximum from the country in the minimum of time—the average duration of a reign was only two and a half years—and thus the word Phanariot has come to stand for bribery, exaction and corruption, though the hospodars themselves were often men of culture and intelligence.

Under this oppressive regime many peasants emigrated; in 1741 there were 147,000 peasant families in Walachia, but four years later their number was reduced by half. In the face of this, the enlightened hospodar Constantine Mavrocordato decreed the abolition of serfdom in 1747, but after numerous rises and falls from favour he was finally imprisoned in 1763 after efforts at reform had proved abortive.

The tide of Ottoman domination was now ebbing fast under Russian pressure; after defeating the Turks at Hotin in 1769, Russian troops occupied both principalities, the bishops and clergy taking an oath to the empress Catherine. At Pocosani in 1772 Catherine demanded that the Porte recognize the independence of Walachia and Moldavia under Russian guarantee, but she was deterred by Austrian opposition, and temporarily satiated by the partition of Poland.

MOLDAVIA

Moldavia took shape in circumstances similar to those of its sister state but somewhat later: according to chronicles, more plentiful than those dealing with Walachia, Dragoș, founder of the principality, emigrated southward with his followers from Maramures in the northern Carpathians (the dates given vary from 1299 to 1342). An independent state first emerged about 1349 under Bogdan. One of the early voivodes, Peter Musat (1375-90) was a member of the Bassarab family of Walachia and, in pursuance of the interests of his kinsman, Mircea the Old, recognized the suzerainty of the king of Poland whose sister he married. From this period date Poland's ambitions to control the new state, which had hardly emancipated itself from Hungarian tutelage. The first important voivode, Alexander the Good (1401-35), acknowledged Polish overlordship and laid the foundations of organized life in the principality. Civil war reigned among Alexander's successors, but a new era in Moldavian history opened with the reign of his grandson Stephen the Great (1457-1504), who was to prove one of the greatest champions of Christendom against the Turks. Patriotic and religious, Stephen was doubly affected by the fall of Constantinople four years before his accession; the cutting of the trade route through the Bosphorus was disastrous for the commerce of the principalities and the desecration of St. Sophia was a blow to Christian feeling. Stephen's whole reign was devoted to the attempt to rally the west against the infidel; he appealed for help to Poland, Hungary and Venice as well as to the pope Sixtus IV, who gave him the title "athlete of Christ."

Stephen inflicted a crushing defeat on the Turks at Rahova in 1475, and again repelled them the following year. Poland and Hungary, however, never gave him the solid support for which he

had hoped; in 1484 the Turks captured his key fortresses of Chilia and Akkerman (later Belgorod-Dnestrovski), and the following year burned the Moldavian capital Suceava. Once again Stephen rallied and defeated the Turks in 1486 at Scheia near Roman. As early as 1484, after the loss of his fortresses, he had been compelled to do public homage to King Casimir IV of Poland, but in 1499 he was able to draw up a treaty on equal terms. Poland, however, once again failed to honour its pledge to give help. On his deathbed Stephen, realizing the hopelessness of securing united action from Christendom, advised his son to submit to the Turks if they would respect the framework of church and state.

Stephen encouraged the arts, gave generous grants of monastic lands and built more than 40 stone churches, and the great monastery of Putna. Stephen's son Bogdan III, the "one-eyed" (1504-17), at feud with Poland over Pokutia, which his father had annexed, and lacking support from the already shaken Hungary, was forced in 1513 to pay annual tribute to the sultan while securing guarantees for the Christian religion and Moldavian institutions. In the anarchy following on the battle of Mohacs a strange figure ascended the Moldavian throne, Peter Rares (1527-38 and 1541-46), an illegitimate son of Stephen. Allying himself with the Turks, he made war on the imperial forces in Transylvania and on Poland, attempting to recover the lost Pokutia. Later he allied himself with the emperor against Poland and the sultan, but was defeated and deposed in 1538. In 1541 he returned to the throne with Turkish help, but concluded a secret treaty with the emperor against the Turks. His successors could no longer oppose Turkish power.

Turkish Penetration.—Peter's son actually accepted Islam; the sultan strengthened his hold on Moldavia by occupying a series of fortresses and increased the tribute. From the middle of the 16th century each aspirant to the Moldavian throne had to buy the consent of the Porte, and the way was thus open to adventurers. The most dramatic was Jacob Basiliscus Heracleides who seized Moldavia from the volvoide Alexander Lapsuaneu with Turkish support. A Greek by birth, he had travelled over Europe and had become the friend of Philipp Melancthon; he attempted to found an educational system in Moldavia, but his heavy taxation led to revolt and he was assassinated in 1563. Under the restored Lapsuaneu and under Bogdan IV (1568-72), Moldavia relapsed into obscurity. Bogdan's successor John the Terrible (1572-74), provoked by the Porte's demand for increased tribute, rose against the oppressor, but was defeated and slain in 1574. Moldavia did not rally until the victories of Michael the Brave at the turn of the century when it was actually incorporated for a year in Michael's Great Dacian realm. After Michael's murder, the Poles again asserted supremacy, but the Porte resumed its domination in 1618. No voivode of any importance occupied the throne until Basil the Wolf (1634-53), a brave soldier of Albanian origin. He might have achieved success against the Turks, but chose instead to attack his neighbour Walachia, coveting its throne. He married one of his daughters to Timothy, son of the celebrated Ukrainian hetman (general) Bogdan Chmielnicki and raided Walachia with the help of his son-in-law, but was routed by the veteran Matthias Bassarab. He was overthrown by a conspiracy of Moldavian boyars, and after his death Greek influence became paramount. One of the Greek hospodars, Demetrius Cantemir, attempted to exchange Turkish for Russian sovereignty, and proving unsuccessful went into exile in St. Petersburg. He was a scholar whose *Description Moldaviae* is a valuable historical source.

The Phanariot regime in Moldavia is generally reckoned from the reign of Nicholas Mavrocordat, Cantemir's successor; it was similar to that in Walachia, and indeed the hospodars were frequently shifted by the Turks from one throne to the other. Moldavia was perhaps more prosperous than Walachia at this period and had a considerable export trade in timber, salt, wine and foodstuffs.

THE DANUBIAN PRINCIPALITIES

The treaty of Kuchuk Kainarjii which ended the Russo-Turkish war in 1774 altered the situation in both Walachia and Moldavia. Russia restored the principalities which it had occupied, to the

sultan (Moldavia, however, lost its northern tip, Bukovina, which Austria, profiting by the situation, annexed) on conditions which included provisions favourable to the territories themselves. The tribute was to be reduced, and the agents of Walachia and Moldavia at the Porte were to have diplomatic status; Russia was accorded a virtual protectorate. In view of Turkish attempts to evade fulfilment of the treaty, Russia secured a more precise definition of its rights in the convention of Ainali-Kavak (1779) and strengthened its position in 1782 by appointing a consul in Bucharest. Austria countered by dispatching an "agent" Ignaz Rajcevic, whose *Osservazioni storiche intorno la Valachia* (1788) is one of the best sources for the period. In the Russo-Turkish fighting which broke out again in 1787 the principalities once more provided battlefields, and Prince Potemkin made his headquarters at Jassy (Iasi). In 1791, when peace was imminent, a group of Walachian boyars, fearing the effects of renewed Ottoman rule, addressed an appeal to Austria and Russia which, though it achieved no results, is of interest as an early sign of the awakening of national feeling. The boyars asked for the ending of Phanariot rule, the return of native princes and the creation of a national army. By the peace of Jassy (1792) Russia had to evacuate the principalities, the Dniester (Dnepr) being recognized as its frontier, and the privileges of the principalities accorded in earlier treaties were confirmed. In defiance of treaties the Porte continued to change the hospodars almost yearly, until in 1803 the Russians obtained a fresh convention under which every prince was to hold office for at least seven years and could not be dispossessed without Russian consent.

The two new hospodars were strongly under Russian influence. Constantine Ypsilanti of Walachia, encouraged by the convention, refused some Turkish requisitions, acted as intermediary between the Serbs and Russia in the Serb revolt of 1804 and tried to embroil the French and the Porte. Napoleon's envoy at Bucharest denounced both hospodars as traitors and influenced the Porte's decision to dethrone them in 1806 without consulting Russia. Russia occupied the principalities and the Turks declared war in Dec. 1806; Moldavia and Walachia had become pawns in the intrigues between the tsar, the Porte and Napoleon. The Russian occupation, which lasted six years, reduced the country to a desert; produce was carried off, the coinage debased and labour requisitioning was enforced by the deportation of recalcitrants to Siberia. The Christian populations exchanged hope and confidence in a liberator for a profound suspicion and fear of Russia which remained rooted in Rumanian minds.

Russia's design to incorporate the principalities in its empire was frustrated by the peace of Bucharest (1812), but it secured the cession of southeastern Moldavia, known as Bessarabia (*q.v.*). The two hospodars who were appointed after the peace in 1812, Ion Caragea in Walachia and Scarlat Callimachi in Moldavia, were masters of extortion. The former increased the taxation eightfold, partly by creating 4,000 new boyars. Both were strongly Greek in feeling, and were supported by some of the boyars, who, disappointed in Russia, dreamed of a new Graeco-Rumanian Byzantium. Caragea was in secret relations with the Greek revolutionary movement, Philike Hetairia, which was being fostered at Odessa under Russian auspices. The way was thus prepared for the adventure of Alexander Ypsilanti, son of the Walachian hospodar Constantine and *aide-de-camp* of the tsar, who marched into Moldavia at the head of the Hetairists in 1821. He received the support of the Moldavian hospodar Michael Sutu (Sutzu), but the boyars were hostile in Moldavia and still more so in Walachia where a national popular movement led by Tudor Vladimirescu (*q.v.*) turned not against the Turks but against the Phanariots. Turkish troops which invaded to crush Ypsilanti were not finally withdrawn until 1824. The Turks, anxious to divide the Rumanians from the Greeks, thought it wise to heed the former's demands and the Rumanians took advantage of this to secure a number of reforms in the national interest. The reforms included the promulgation of laws in Rumanian and the appointment of native princes, the first of whom were Ion Sturdza in Moldavia and Gregory Ghica in Walachia. Ghica's family, though of Albanian extraction and settled at the Phanar, was entirely rumanized.

Both princes were anti-Greek and unacceptable to the Russians; Sturdza was accused of subversive tendencies because he cherished plans for constitutional reform, including an elected assembly.

Kiselev and the "*Règlement Organique*"—Russia and Turkey resumed relations in 1835 and by the convention of Akkerman signed by them in 1836 the privileges of the principalities were once more confirmed, and Russia was again allowed a voice in elections to the two thrones. On the outbreak of hostilities between Russia and Turkey again in 1828, Russia once more occupied Wallachia and Moldavia. The peace of Adrianople in 1839 left them still tributary to the sultan, but wholly under Russian protection. The two hospodars were thenceforth elected for life.

Russia secured a continuation of its occupation by making evacuation conditional on the payment of an impossibly high indemnity by Turkey. The occupation, which had again been exceedingly onerous during the war, became more enlightened after the signing of the treaty, a change which was largely due to the Russian administrator, Count Pavel Kiselev. The boyars, under Kiselev's supervision, drew up a constitution known as the *Règlement organique*, promulgated in Wallachia in 1831 and in Moldavia in 1832. It was wholly oligarchic in character, but was an advance in that legislative and administrative powers were vested in a native elected body. The economic provisions of the *Règlement*, however, deepened the cleavage between the boyars and the peasant class and were censured by Kiselev. The *Règlement* was ratified by the Porte in 1834, whereupon Russia withdrew its troops.

The National Movement and 1848.—The new hospodars, Alexander Ghica (1834-42) in Wallachia and Michael Sturdza in Moldavia, were, however, strongly under Russian influence. Ghica's successor George Bibescu (1842-48) had been educated in Paris and was influenced by the new spirit of romantic nationalism. In agreement with Sturdza he removed the fiscal barriers between the principalities. Meanwhile a new generation of Rumanians was growing up, educated in Paris or looking to France for inspiration; these came rapidly to the front in the great crisis of 1848 which in the principalities took a form partly national and partly social. The national movements in Moldavia and Wallachia were spurred on by the dramatic upsurge among the downtrodden Rumanian peasants of Transylvania, which culminated in the "field of liberty" demonstrations at Blaj in May 1848. Sturdza in Moldavia proved able to quell popular agitation; Bibescu, although he had some sympathy with the movement, lacked courage to lead it and fled, leaving in power a provisional government largely controlled by Ion C. Bratianu (*q.v.*), first head of the great Liberal family which for so long dominated Rumanian politics. The Turks, under Russian pressure, were forced to put down the new movement; joint Russo-Turkish military intervention restored the *Règlement organique*. The Balta-Liman convention of 1849 laid down that the hospodars should again be appointed for seven years only; the assemblies were replaced by so-called *divans ad hoc*. Gregory Alexander Ghica was appointed hospodar in Moldavia, and Barbu Stirbey, brother of George Bibescu, in Wallachia.

Crimean War and Treaty of Paris.—Russian troops did not evacuate the principalities until 1851, and during the Crimean War they were occupied in turn by Russia and Austria. Although they suffered severely, the Austrian occupation brought material benefits and opportunities of contact with the west. The treaty of Paris (1856) placed the principalities with their existing privileges under the collective guarantee of the contracting powers, thus ending the Russian protectorate, though retaining the suzerainty of the Porte. The Russian frontier was withdrawn from the mouths of the Danube by the return of a strip of southern Bessarabia to Moldavia. The existing statutes were revised in 1857 by a European commission with a Turkish member meeting at Bucharest, assisted by two *divans ad hoc* called together by the Porte.

Union of the Principalities.—The *divans* voted unanimously for autonomy, union of the principalities under the name of Rumania, a foreign hereditary prince and neutrality. The *divans* were dissolved by the Porte in Jan. 1858 and in August the convention of Paris accepted their decisions with modifications. There were still to be two princes and two assemblies, but a central com-

mission at Focsani was to prepare measures of joint concern. The two assemblies, meeting at Jassy and Bucharest respectively, then elected a single prince in the person of Alexander Cuza (*q.v.*) on Jan. 17, 1859. The *de facto* union of Rumania was thus accomplished.

RUMANIA

A new conference met in Paris to discuss the situation and in 1861 the election of Prince Cuza was ratified by the powers and the Porte. In Feb. 1862 a single ministry and a single assembly replaced the *divans* and central commission. Cuza, in May 1864, promulgated by plebiscite a new constitution providing for a senate as well as an assembly and extending the franchise to all citizens, with the reservation of a cumulative voting power for property. An important agrarian law of the same year emancipated the peasantry from forced labour. Prince Cuza's agrarian and educational reforms were progressive, but his methods of enforcement were despotic. He alienated the boyars by abolishing forced labour, and the clergy by confiscating monastic estates (see *Religion* below), while the agrarian reform was not radical enough to satisfy the peasantry. In Feb. 1866 he was compelled to abdicate and the principalities by referendum elected as prince, almost unanimously, Charles (see CHARLES [Karl Eitel or Carol]), second son of Prince Charles Anthony of Hohenzollern-Sigmaringen, the candidate of Ion Bratianu, who had secured the veiled support of Napoleon III. The new prince reached Bucharest on May 22, 1866, and in July took the oath to a new constitution modelled on the Belgian charter of 1831, which provided for upper and lower houses and gave the prince an unconditional veto on all legislation. Turkish assent was secured in October; Prince Charles was recognized as hereditary ruler and was allowed to maintain an army of 30,000 men.

Internal Politics, 1866-75.—Prince Charles's policy was to avoid all political adventures and to give Rumania a sound administration. The internal situation was at first unsettled; ten governments held office in five years. The dominant figure was the Liberal leader Ion Bratianu.

In 1869 Prince Charles paid a series of state visits to consolidate his position, and married Princess Elizabeth of Newwied, the poetess later known as Carmen Sylva, who earned great popularity in her adopted country. Prince Charles was a Roman Catholic and his wife a Protestant, but he agreed to bring up his successor in the Eastern Orthodox faith.

Tension arose between the German prince and his pro-French politicians on the outbreak of the Franco-German War in 1870 and there was an abortive attempt to overthrow him in a revolutionary outbreak at Ploesti. Anti-German feelings were increased by a scandal in the new Rumanian railways; the German contractor failed to honour the coupons of the bonds, mainly held by influential Germans, and the Prussian government attempted to coerce the Rumanian government into payment. Indignation in Rumania culminated in a mob attack on the German colony in Bucharest in March 1871, and Prince Charles contemplated abdication. A Conservative government formed under Lascar Catargiu succeeded in restoring order, however, and retained office for five years. After another crisis threatening Prince Charles, the Liberals again took office in 1876 and Bratianu became premier; he enjoyed almost absolute power for the next 12 years.

The Russo-Turkish War, 1877-78, and the Treaty of Berlin.—Domestic problems were temporarily eclipsed by the reopening of the Eastern Question in 1877. Russia rejected Rumania's offer of co-operation on equal terms against Turkey and threatened occupation. On April 16, 1877, Rumania signed a secret convention allowing free passage to the Russian armies, while the tsar promised to respect Rumanian territory. The Russians crossed the Rumanian frontier in April, and on May 11 Rumania declared war on Turkey. Rumanian troops contributed materially to the joint victory at Plevna in September, which left the Russian army free to march on Constantinople. Nonetheless Russia refused to admit Rumanian representatives to the peace negotiations at Adrianople and later at San Stefano. The Russians insisted on the handing back of southern Bessarabia which had been restored

to Moldavia after the Crimean War, and despite bitter Rumanian protests this provision was incorporated in the treaty of Berlin; Rumania received an alternative outlet to the mouths of the Danube in northern Dobruja, a territory with little or no Rumanian population, the possession of which later caused discord with Bulgaria.

The treaty recognized Rumanian independence and guaranteed absolute freedom of worship without loss of political rights. The latter article (44) caused indignation in the country and could not be implemented without constitutional revision. Article 7 of the 1866 constitution stated that "only Christians can become citizens of Rumania," thus excluding Jews from civic rights. Jews had not been numerous in the principalities until the early 19th century, but their influx after the treaty of Adrianople had caused the safeguard to be put into the constitution. Under pressure from the powers, article 7 was finally repealed.

Independence of Rumania: the Kingdom.—The independence of Rumania was recognized by Italy in Dec. 1879 and by Great Britain, France and Germany in Feb. 1880. Prince Charles, having no children, regulated the succession in 1880 in favour of his nephew Prince Ferdinand of Hohenzollern, and the idea of making Rumania a kingdom was mooted. The Liberal government, accused by the Conservatives of republican tendencies, itself took the initiative in proclaiming the kingdom. This action was hastened by the general fear of revolution consequent on the assassination of Tsar Alexander II. Charles was crowned king on May 22, 1881, and secured the immediate recognition of the powers.

Internal Politics, 1878-1912.—Since 1876 Bratianu had exercised almost dictatorial power. His Liberals stood for the rapid development of a strong middle class able to control the Jews, and were mainly Francophil. The Conservatives were divided into the old boyar group, which tended to look to Russia, and the so-called Young Conservatives, the Junimists, led by Petre Carp, who had studied in Germany rather than France and favoured the Central Powers. Bratianu retired after electoral defeat in 1888, and died three years later. Thereafter various Conservative and Junimist administrations held office, the Liberals under Sturdza returning to power in 1895.

The country was in considerable financial difficulties and there was much discontent, particularly in the countryside where the peasants, though emancipated in 1864, were forced by poverty into the hands of Jewish moneylenders. A serious peasant rising in 1907, stimulated by the Russian upheaval of 1905, attacked first the Jews and then the large landowners. The Conservative ministry had to resign and it was a Liberal government which restored order. In 1909 the Liberal leader Sturdza resigned and was succeeded by Ionel Bratianu, eldest son of the great statesman, who continued to base his policy on the expansion of the urban middle class, though some of his younger colleagues concentrated on the agrarian problem. The Conservatives under Carp came to power again in 1911, but were violently attacked by the Liberals and a group of Conservative dissidents formed after the peasant rising under Take Jonescu. Under the pressure of foreign events the cabinet was reconstituted in 1912 with Titu Maiorescu as prime minister and Jonescu as minister of the interior. In Jan. 1914 Ionel Bratianu succeeded Maiorescu and formed a Liberal administration; together with the party theorist Constantine Stere, a Bessarabian boyar who had been banished to Siberia for his radical views, he worked out a program of agrarian reform.

Foreign Affairs, 1878-1912.—The foreign political situation remained comparatively calm between the treaty of Berlin and the outbreak of the Balkan wars, though Rumania's relations with its neighbours could not be cordial. Bulgaria, a traditional friend, was embittered by the loss of northern Dobruja; against Russia the Rumanians were incensed by the forced retrocession of southern Bessarabia. The resentment aroused against Austria at the end of the 18th century by its seizure of Bukovina, the first home of the Moldavian principality and repository of its chief artistic and ecclesiastical treasures, had died down, but ill feeling was aroused by the commercial treaty of 1875, which Rumania considered unfair, and was intensified by Austria's insistence on having a delegate on the Danube commission, though the commis-

sion's writ only ran from Galati (Galatz) to Orsova and did not reach Austrian soil. The oppressed Rumanians of Transylvania had been increasingly conscious of grievance against Hungary since 1848 and their feelings were shared in Rumania. With Greece there was a constantly reviving dispute in which Bulgaria was also involved, concerning the status of the Vlach (*g.v.*) communities in Macedonia over which Rumania claimed the rights of a protector; this caused a diplomatic rupture between Rumania and Greece from 1905 to 1911.

King Charles had a natural and pronounced preference for the Central Powers, and in this he was supported by Ion Bratianu, whose fear and dislike of Russia after the treaty of Berlin outweighed his Francophilia. It was Bratianu, with Sturdza as foreign minister, who signed the secret treaty of 1883 with Austria and Germany. The treaty, remaining a close secret, was formally renewed under a Conservative administration in 1892. It was, however, the first signatory, Sturdza, leader of the Liberals since 1893, who was most active in support of the claims of the Transylvanian Rumanians against Hungary. The Bosnian crisis of 1908 alarmed Rumania because it showed that Austria was prepared to further the fortunes of Bulgaria in order to destroy Serbia. Ionel Bratianu, however, on succeeding Sturdza in 1909, remained faithful to the secret treaty.

First Balkan War, 1912.—The outbreak of war between the Balkan league and Turkey in 1912 found the Conservatives in office. Rumania's sympathies were at first uncertain; the secret Serbo-Bulgarian military convention of March 13, 1912, had provided against a possible Rumanian attack. The rapid success of the Bulgarians caused Rumania to abandon its original profession of disinterestedness and to stake a claim. Rumania intimated to Bulgaria that in the event of a partition of European Turkey it would, in the interests of the balance of power in the Balkans, require a frontier rectification in the Dobruja. Danev, president of the Bulgarian house of deputies, returning through Bucharest from a visit to Vienna and Budapest, offered only minor frontier rectifications, excluding Silistra, which was the kernel of Rumania's claims. He did, however, consider the renunciation of Bulgaria's claim to northern Dobruja and the giving of a guarantee for the Vlachs of Macedonia. No agreement was reached in Bucharest or in London in Jan. 1913. The case was finally submitted for arbitration to the conference of St. Petersburg (May 1917) which assigned Silistra to Rumania. Bulgaria regarded the concession as excessive and Rumania no longer looked on it as a satisfactory price for neutrality.

Second Balkan War, 1913.—Bulgaria's attack on its allies in July 1913 was used by Rumania as a pretext for intervention. The Rumanian army, 500,000 strong and commanded by the crown prince, crossed the frontier (July 10), occupied southern Dobruja and advanced on Sofia. Negotiations were immediately opened at Bucharest, where an armistice was signed on July 31, 1913, between Rumania, Serbia, Greece and Bulgaria. By the treaty of Bucharest, signed on Aug. 10, Rumania obtained southern Dobruja which it had already occupied.

Rumania's position was now precarious in view of the growing tension between Vienna and St. Petersburg. The king renewed the secret treaty with the Central Powers at the beginning of 1914 and Austria made great efforts to win Rumanian friendship, but popular sentiment ran the other way. The feeling of kinship with Transylvania grew steadily among the younger generation, while Austria's continued diplomatic support of Bulgaria aroused resentment. The growing feeling of the need for a policy covering the interests of the entire Rumanian nation, within and without the national frontiers, led to a new inclination toward Russia. Though Russia held Moldavian Bessarabia, Austro-Hungary, as arbitrator of the destinies of the much more highly developed Rumanian communities in Transylvania, was the greater obstacle to the realization of dreams of unity. The visit to St. Petersburg of Prince Ferdinand, heir to the throne, in March 1914 and of the tsar to Constanta in June, did not bring about a definite change of policy, however.

Rumania and World War I.—On the outbreak of war in 1914 Ionel Bratianu and his Liberal party were in office. The poli-

ticians were divided in their views, not along party lines, and Rumania at first maintained armed neutrality, though tempted by the Central Powers with the promise of the return of Bessarabia and by the Allies with the offer of Transylvania. Grief at the country's failure to honour the secret alliance hastened King Charles's death in Oct. 1914. His successor Ferdinand had married Marie of Edinburgh, granddaughter of Queen Victoria and of Alexander II, stronger in character than her husband and a staunch lover of England and Russia. Her influence, Allied promises, and alarm at the extent of German victories finally brought Rumania into the war. By a treaty of Aug. 17, 1916, Great Britain, France, Russia and Italy guaranteed Rumania the Banat, Transylvania, the Hungarian plain up to the Tisza (Theiss) river and Bukovina as far as the Prut river. Rumania declared war on Austria-Hungary on Aug. 22; its troops at once crossed the passes into Transylvania, but were expelled by mid-November. Bucharest was occupied by the Central Powers on Dec. 6, 1916. The king and his ministers and parliament had already retired to Jassy and were followed by the army, which reorganized in Moldavia under the shelter of the Russian forces. The Russian Revolution of Feb. 1917 led to the collapse of the front and left the German Field Marshal August von Mackensen free to throw all his forces against the Rumanian army, which was rendered incapable of further resistance after a prolonged stand at Marasesti in August. After the October revolution the Russian army disintegrated into pillaging bands, hostilities were suspended and an armistice was concluded on Dec. 6, 1917.

During this period the parliament in exile at Jassy was busy with projects of agrarian and electoral reform. Bratianu had already been considering these topics in 1914, and in Dec. 1916 he made a coalition with Take Jonescu and his dissident Conservatives, who had been concerned with the peasant question since the 1907 rising. The effects of the Russian Revolution in the Ukraine and Bessarabia (*q.v.*), where the peasants had appropriated the land, made the question urgent. King Ferdinand was personally concerned and induced the Conservatives to agree to a project of radical expropriation, which was passed in July 1917.

The Treaty of Bucharest.—After Bratianu resigned on Feb. 9, 1918, Gen. Alexandru Averescu was charged with the peace negotiations at Buftes, near Bucharest. The Dobruja was ceded as far as the Danube, Bulgaria taking over the southern half which it had lost in 1913, while the Central Powers administered the northern half conjointly. Rumania was to have a trade route to the Black sea via Constanta. The frontier of Hungary was advanced in the Carpathians. The Central Powers secured such terms on the Danube, in the Rumanian oilfields and over the railways, as would have placed Rumania in a state of economic slavery to them for many years. Averescu's cabinet hesitated to sign and resigned on March 12 in favour of the pro-German Alexandru Marghiloman ministry, which signed the treaty at Bucharest on May 7, 1918.

Marghiloman's ministry struggled against almost unsurmountable difficulties throughout the succeeding months. The Central Powers forced the Banque Générale to issue 2,500,000,000 lei in paper money. This disorganized the finance of the kingdom, while economic ruin was ensured by the forced export of sheep and cattle, the cutting down of forests and the dismantling of factories. The population meanwhile was starving, and the morale of the working class was being perverted by revolutionary propaganda.

On Nov. 8, 1918, when the defeat of the Central Powers was assured, the king called to power General Coanda, who repealed all laws introduced by the Marghiloman ministry and decreed universal, obligatory and secret suffrage for all male voters over 21 years of age. War was declared again on Nov. 9. The king re-entered Bucharest (Nov. 30) after the German troops had evacuated Rumania under the terms of the Armistice. Bratianu again became prime minister on Dec. 14.

GREATER RUMANIA

The dream of greater Rumania was realized, but it was no easy task to unite provinces which had been under the domination of

different alien states. Bessarabia (*q.v.*) was already incorporated in the old kingdom, having abandoned an earlier idea of autonomy. Its council voted for unconditional union on Dec. 9, 1918. The incorporation of Transylvania (*q.v.*) followed in virtue of a resolution passed by a Rumanian assembly at Alba Julia on Dec. 1, and that of Bukovina (*q.v.*) on Nov. 28. The government had to carry on difficult diplomatic negotiations for the recognition by the Allies of the new frontiers. Those fixed by the agreement of Aug. 1916 were drawn back in places to give the Hungarians a part of the hinterland of Oradea Mare, and the Yugoslavs the western half of the Banat. A line of demarcation was fixed in Hungary, and Rumanian troops occupied the country up to this line, pending final settlement by treaty. In March 1919 a further neutral zone was established and Rumania was given the right of occupying it. Bela Kun's Communist government which then came into power in Hungary started a campaign as a result of which the Rumanians advanced to the Tisza river, where they were stopped by the Allies on May 9. On July 22 Kun started a new offensive, but the Rumanian army defeated his troops, crossed the Tisza—despite the interdiction of the Allies—and occupied Budapest on Aug. 4. There they remained, in the face of numerous protests, until Nov. 14. The treaties of St. Germain and Trianon recognized as Rumanian the predominantly Rumanian territories of the old dual monarchy, and the treaty of Neuilly sanctioned Rumanian possession of southern Dobruja.

Domestic Politics, 1919-1930.—The political scene was transformed after 1918; the old Conservative party was swept away because of its pro-German policy and the impoverishment of its chief supporters, the boyars. The Liberals became the party of the business and professional classes, while the peasants, who gained new status through the land reform, founded a party of their own in the old kingdom headed by Ion Mihalache. More radical elements came in from Transylvania, notably the National Popular party headed by Iuliu Maniu and Alexandru Vaida-Voevod. The Socialists were not influential as more than 80% of the population of Rumania were peasants; in the old kingdom the Socialists were mainly Marxist and supported the Russian Revolution, but in Transylvania they looked to the west.

The new parties had their chance as early as Dec. 1919 in a coalition cabinet headed by Vaida-Voevod, the Bratianu government having resigned in protest against the minorities clause of the treaty of Trianon (article 60), but their tenure of office was short. General fear of Communist propaganda and the alarm of the landowners at the proposed expropriation led to the government's resignation in March 1920 and the return of a new People's party containing many former Conservatives, led by General Averescu, hero of two wars.

He secured the able Take Jonescu as minister of foreign affairs. The general, despite personal sympathy with the peasants, had to take strong measures to restore order. A revolutionary movement was breaking out on the Dniester and securing support among extremists in the old kingdom, and social tension reached a climax in the general strike of Oct. 1920. The failure of the strike split the Rumanian socialist movement. The more moderate leaders were imprisoned, and the Communists, who had kept underground, gained the upper hand. They voted for the affiliation of the party with the Comintern at a congress in May 1921, whereupon 70 leaders were arrested. The Social Democrats thereafter kept separate, and the Communist party was outlawed in 1924.

Meanwhile Averescu had to put through the promised land reform. The bill was introduced in the spring of 1921 by the minister of agriculture, Constantin Garofidi, himself a large landowner. After impassioned controversy, expropriation was put through on the lines agreed in July 1917, estates being limited to 500 ha. in the old kingdom, and to much smaller areas in Bessarabia and Bukovina. The peasants were not wholly satisfied; the holdings allotted were often unduly small and there was no adequate arrangement for the granting of credits for the purchase of seed and tools.

The Liberals came to power at the beginning of 1922, remaining in office with one short break until 1928. Bratianu dominated

the scene until his death in 1927 and thus had the satisfaction of being in office for the coronation of King Ferdinand as sovereign of united Rumania at Alba Julia on Oct. 15, 1922.

A new constitution was adopted in March 1923 based on that of 1866 but with the addition of manhood suffrage. The Jews were given citizenship rights, but their inflow in large numbers after World War I provoked violent hostility. In the financial sphere the Liberal government pushed through the difficult policy of coupling industrialization with the exclusion as far as possible of foreign capital, which bore heavily on the peasants who had to pay for it by export duties. The chief cause of Liberal unpopularity, however, was the centralization of administration. All the new provinces, even including backward Bessarabia, had hoped for a measure of autonomy, and this feeling was strongest in Transylvania where bitter hostility was aroused by the arrival of officials from the old kingdom. The minorities problem was to prove troublesome to all Rumanian administrations in the years following World War I, and none succeeded in finding a solution.

Bratianu proceeded in 1926 to push through an electoral law giving great advantages to the party in power at election time. By this law those who secured 40% or more of the votes were given half the seats in the chamber, plus a share in the remainder in proportion to the number of votes obtained. When a ministry fell as a result of an adverse vote in the chamber, the king could call on the leader of the next largest party to form a cabinet and hold elections. Until 1937 no party in charge ever failed to secure the necessary 40%. The Liberal party's popularity was slowly waning at the end of 1925, and in the face of growing discontent King Ferdinand again called on General Averescu to form a cabinet. His party, with some peasant support, secured four-fifths of the seats in the chamber in the elections of March 1926, largely because of successful pressure at the polls. Though the Liberals still had 16 deputies it was clear that the new administration governed largely with their support. Meanwhile the opposition was greatly strengthened by the fusion, in Oct. 1926, of Maniu's National Popular party with Mihalache's Peasant group to form the National Peasant party, which was to represent the majority of the Rumanian people. Averescu resigned in June 1927 and Bratianu was again returned; the newly formed National Peasant party, despite universal popularity, polled only 20% of the votes in the obviously manipulated elections.

The political situation was complicated by the dynastic position. In Dec. 1925 Crown Prince Carol had left Rumania, renouncing all his rights in favour of his young son Michael. In view of King Ferdinand's precarious health a council of regency was formed in Jan. 1926 consisting of the patriarch Miron Cristea, the president of the supreme court Gheorghe Buzdugan, and the king's second son, Prince Nicholas.

King Ferdinand died on July 29, 1927, and Bratianu died in November of the same year. The Liberal party, thus weakened, was faced with an economic crisis and peasant demonstrations. The regency council in May 1928 entrusted Maniu with forming a cabinet and holding elections; his National Peasant party was returned with a majority of more than 75%. The new government abolished censorship and martial law, mitigated the police regime, promised concessions to the minorities and in June 1929 introduced, to the great satisfaction of the Transylvanians, an administrative reform bill aiming at extensive decentralization. The peasants were helped by the repeal of the export duties; co-operatives were encouraged and free sale of land allowed, a measure which unfortunately led to an increase of the rural proletariat rather than to a consolidation of prosperous peasant holdings as had been intended. The economic situation was greatly eased by the entry, at last allowed, of foreign capital.

Foreign Policy, 1920-1937.—Rumania's foreign policy after Trianon was necessarily based on an endeavour to maintain the status quo and to protect itself against aggression. Rumania was from the first a consistent member of the League of Nations, but built up a careful system of regional pacts to buttress collective security. The first such pact was concluded with Poland in March 1921, when Take Jonescu and Prince Eustachy Sapieha signed a treaty providing for mutual assistance in the event of

unprovoked attack on the eastern frontier. Both countries were threatened by the U.S.S.R., which had not recognized Rumania's right to Bessarabia and seemed little satisfied with Poland's possession of its former Ukrainian and Byelorussian territories.

Take Jonescu had hoped to form a Baltic-Aegean bloc to act as a buffer between Germany and the U.S.S.R., but had to be content with joining the little entente (q.v.) system. An agreement with Czechoslovakia for mutual protection against Hungary was signed in April 1921 and with Yugoslavia for similar protection against Hungary and Bulgaria in June. He sought further to cement Balkan friendships by dynastic alliances. Marriages were concluded between Crown Prince Carol and Princess Helen of Greece (March 10, 1921), between his elder sister Princess Elizabeth and the crown prince of Greece (Feb. 1921) and between Princess Marie and King Alexander of Yugoslavia (June 6, 1922).

General Averescu, in his 1926-27 administration, extended Rumania's system of pacts to include its "Latin sisters." A treaty of alliance and nonaggression was signed with France in June 1926 and another in September of that year with Italy. The Italians, after long hesitation, recognized the incorporation of Bessarabia in Rumania in March 1927. Relations with the U.S.S.R. remained in a state of tension; during 1924 the Soviet Union kept up continuous agitation and threats of war, even setting up a three-day Communist republic at Tatar Bunar in southern Bessarabia. A conference held in Vienna in April 1924 between Rumanian and Soviet representatives led to no results. The situation was eased when Nicolae Titulescu became foreign minister in 1927. In 1933 both countries signed the convention of London defining the aggressor, and with the U.S.S.R.'s entry into the League in 1934 and the exchange of letters between Titulescu and Maxim Litvinov later that year it was hoped that the Bessarabian question was settled. Rumania entered into diplomatic relations with the U.S.S.R. in 1934, but the Bessarabian question remained open and was raised again by the Russians after Titulescu had been dropped from the Rumanian cabinet in 1936.

Agreement with Bulgaria, resentful at the loss of southern Dobruja to Rumania and at the inclusion of parts of Macedonia in Yugoslavia and Greece, proved out of reach; nonetheless, the Balkan pact, signed in 1934 between Rumania, Yugoslavia, Turkey and Greece, was left open to Bulgaria.

Rumania under King Carol.—Maniu, dissatisfied with the regency, arranged for the return of Carol from exile with the agreement of all the major parties. Carol was proclaimed king on June 9, 1930, his son Michael becoming crown prince (grand voivode). Conflict soon arose between the king and Maniu, who had exacted a promise that Carol would leave his Jewish mistress Magda Lupescu abroad if he resumed the throne and would seek reconciliation with Queen Helen. On the king's breaking this promise Maniu resigned the prime ministry in Oct. 1930, though his party remained in power under Gheorghe Mironescu. King Carol was from the first determined to secure absolute power and to break up the old political parties. Maniu's resignation and the world economic crisis helped to bring down the National Peasants in 1931. After Mironescu's resignation the foreign minister Titulescu attempted to form a cabinet, and on his failure the king appointed one of his own choice headed by his former tutor Nicolae Joja. The elections of June 1931 gave the government a majority of 291 seats out of 387, but it resigned a year later. The National Peasants had a brief return to power and it fell to Vaida-Voevod to deal with the serious Communist-inspired railway strike at Grivita in Feb. 1933, but the party, split through King Carol's intrigues, could no longer keep itself in power. The Liberal opposition was also split; the leaders Ionel Bratianu and his brother Vintila were dead and the third brother Constantin (Dinu) had not their grip over the party, while their nephew Gheorghe was on the king's side. Nevertheless the Liberals returned to power in 1933 under an anti-Carol leader Ion Ducea.

Rise of the Iron Guard.—The king was helped in his disruption of the older parties by the rise of a new group of fascist type which was taking shape in Moldavia, feeding on endemic Rumanian anti-Semitism and the economic crisis. The leader, a young man named Corneliu Zelea Codreanu, first called his group

the legion of the archangel Michael; later it had many names, the best known being the Iron Guard. Priests, officers and students flocked to Codreanu's standard; the party had a mystical appeal and its leaders wore the trappings of romance. Its slogan was the Christian and racial renovation of Rumania: in foreign affairs it opposed co-operation with France, the U.S.S.R. or the League of Nations and sympathized with Germany and Italy and later with Francisco Franco in Spain; at home it tempted the peasants with the slogan *omul si poganul*—"one man, one acre."

The Iron Guard gained its first four seats in parliament in 1932; its policy of violence, which had already been demonstrated by the murder of the prefect of Jassy, was carried forward by the assassination of the prime minister Duca, on Dec. 30, 1933, a month after he had assumed office. Unlike the neighbouring Balkan states Rumania had not in modern times been prone to political murders and the country was profoundly shocked. The new Liberal premier Gheorghe Tatarescu proscribed the Iron Guard, but reappearing under another name—*Totul Pentru Tara* (everything for the fatherland)—it succeeded in securing Titulescu's removal from the foreign ministry in Aug. 1936.

In the 1937 elections, presided over by Tatarescu, the government for the first time failed to secure the necessary 40% of the votes. It was highly unpopular, and the opposition was unexpectedly consolidated by the conclusion of an electoral pact between the National Peasants and the Iron Guard, which led to much criticism of Maniu. The Guard secured 16% of the votes. King Carol, alarmed at this success and not wishing to have Codreanu as a rival dictator, dropped his earlier policy of covert support and called on the elderly Transylvanian poet Octavian Goga, leader of the right wing anti-Semitic National Christian party, to form a government. After a few weeks of violent anti-Semitic action, at which the British and French ministers protested, Goga was dismissed by King Carol, who then proclaimed a personal dictatorship. A new constitution of corporative type was published on Feb. 20, 1938, and "accepted" in a plebiscite. The patriarch Miron Cristea was made prime minister with Tatarescu as his deputy. In April Codreanu and other guardsists were sentenced to ten years' imprisonment. The guard replied with a renewed terror campaign, and in November King Carol, returning from a post-Munich visit to the western capitals, had Codreanu and 13 of his followers "shot while trying to escape."

On Dec. 16 the king founded a monopoly party, the National Renaissance Front, to support his government, and announced certain concessions to the minorities, who accordingly joined the front. Miron Cristea, the patriarch and prime minister, died in March 1939 and was succeeded by Armand Calinescu, minister of the interior in the former government. Elections on a corporative basis were held in June, the electorate under the new constitution being 2,000,000 compared with 4,500,000 in 1937. The senate was designed to include old parliamentarians, and the leading political figures, Maniu and Mihalache of the National Peasant party and Dinu Bratianu, head of the National Liberals who disapproved of the Tatarescu faction, automatically became members. They refused, however, to take the oath to the new constitution, and were suspended. Women could vote and, for the first time in Rumanian history, stand as candidates, but only for the senate. The Iron Guard continued to foment unrest during the summer of 1939 with German backing and on Sept. 20 murdered the prime minister, Calinescu; after the brief premiership of Gen. Gheorghe Argesanu, who was able to secure some degree of public order, Constantin Argetoianu became prime minister for two months and was then succeeded by Tatarescu.

Foreign Policy, 1938-39.—The Anschluss and the Munich agreement overthrew the whole system of Rumanian foreign policy. Relations with Italy were already embittered through Rumania's adopting sanctions at the League's bidding during the Abyssinian war; and the pact with Italy had lapsed in 1936. Rumania had been ready to fulfil its obligations under the little entente and to come to the aid of Czechoslovakia during the Munich crisis, even secretly agreeing to allow Soviet troops to cross its territory. The Polish alliance stood, even after Munich, but Rumania refused Poland's offer of a slice of Czechoslovak ter-

ritory in Ruthenia in Oct. 1938. Confidence in the west had been shaken by Munich, and in March 1939 a trade treaty was signed with Germany designed to put the whole of Rumania's economic life at German disposal. The new foreign minister, Grigore Gafencu, made a last attempt to seek support in the west, securing a Franco-British guarantee of Rumanian territorial integrity on April 13, 1939. Rumania's only real hope, however, lay in German-Soviet antagonism, and that was shattered by the Ribbentrop-Molotov pact in August.

World War II.—The invasion and dismemberment of Poland in Sept. 1939 found Rumania powerless to help its ally; Rumania declared neutrality on Sept. 4. The collapse of France in the summer of 1940 removed the last prop of Rumanian morale; nonetheless, King Carol made efforts to put the army on a war footing and announced that the country's frontiers would be defended at any cost. Under German pressure the foreign minister, Grigore Gafencu, was forced to resign and was succeeded by the strongly pro-German Ion Gicuritu. On June 21 the king agreed to turn the National Renaissance Front into a still more totalitarian national party which included Iron Guardsists, under Horia Sima, released on German orders.

The first blow fell on June 27 when in agreement with Germany the U.S.S.R. occupied not only Bessarabia, but northern Bukovina, which had never been in Russian possession. Rumania was forced to accept, renounced the British guarantee on July 2 and on July 4 appointed a new pro-German cabinet with Gicuritu as prime minister and Horia Sima as minister of culture. On July 16 Germany was "invited" to send a military mission. Hungary now had to be conciliated; on Aug. 30 Germany and Italy imposed the Vienna award whereby Hungary was to be given northern Transylvania, an especially bitter blow to Rumanian patriotism. The people wished to fight and looked for a lead to Maniu, the grand old man of Transylvania. While he hesitated the Iron Guard, despite their pro-German attitude, led the national protest and demanded the abdication of King Carol, who was made the scapegoat. The king left on Sept. 6 with Magda Lupescu, leaving his 19-year-old son Michael on the throne as Mihai I. Before his departure he entrusted power to a general, Ion Antonescu, who formed a government consisting largely of Iron Guardsists, with Horia Sima as vice-premier. The constitution was suspended and Antonescu given full powers. Meanwhile Bulgaria, with German support, had been agitating for the return of southern Dobruja; the agreement for its cession was signed at Craiova the day after Carol's departure. Rumania lost about 3,500,000 subjects to the U.S.S.R., 2,400,000 to Hungary and 360,000 to Bulgaria. There were rumours that Germany intended also to separate the Banat (g.v.) from Rumania, but in the end that territory was merely accorded semiautonomy under the large local German minority. Germany and Italy guaranteed rump Rumania. Rumania was declared a "national legatory state" on Sept. 15 and joined the Tripartite pact on Nov. 23.

German troops had been pouring into the country since September, but as the Germans had decided to reduce Rumania to complete subservience by playing off the Iron Guard against Antonescu, the *Wehrmacht* stood by when the guardsists staged a St. Bartholomew's night on Nov. 28 in which 64 prominent members of the old regime were assassinated, including Jorga and the peasant leader Virgil Madgearu. Antonescu now secured German support in putting down the Guard, which staged a more serious rising at the end of Jan. 1941 under the leadership of Sima, vice-premier in Antonescu's cabinet, and Ion Codreanu, father of Corneliu. The revolt was finally suppressed with about 6,000 casualties; Sima escaped. The new administration formed at the end of January was mainly military, all guardsists being excluded. Some 500,000 German troops were in the country by February, and on Feb. 10 Great Britain broke off diplomatic relations. Antonescu refused to join Adolf Hitler in smashing Rumania's ally Yugoslavia in April 1941, but the country was behind him in entering the war against the U.S.S.R. as Germany's ally on June 22. Great Britain declared war on Rumania on Dec. 7 and on Dec. 12 Rumania declared war on the United States. Rumania's recovery of Bessarabia in the summer of 1941 was

highly popular in the country, but the opposition leaders underground, in particular Maniu, strongly disapproved of the army crossing the Dniestr into Soviet territory in 1942 and of the organization of a new Rumanian province beyond the river known as Transnistria. This did give outlet to national energies, however, and the war did not become thoroughly unpopular until the disastrous casualty lists came in from Stalingrad.

The Communist Regime.—Although Rumania had not had a parliamentary government since 1938 the chief political parties had kept their organizations intact; the National Peasants under Maniu and the Liberals under Dinu Bratianu formed a rallying point for popular discontent with the course of the war and the fruits of Antonescu's pro-Axis policy, and undertook secret negotiations with the Allies during 1943. The traditional parties were supported in the desire for an armistice by the pro-Soviet left-wing groups, the Social Democrats under Titel Petrescu and the Communists under Lucretiu Patrascanu. The Communists, whose organization had long been illegal, numbered only about 20,000 in 1944; they had no war record of partisan activity to give them prestige and few of the leaders were of Rumanian race, the majority being Russian-trained Jews, Ukrainians or Hungarians. The party gained powerful reinforcement in its lower ranks after 1941 from among the leaderless and disillusioned Guards, ready for any violence. In the spring of 1944 these four parties agreed to form a national bloc to bring the country out of the war. The coup d'état of Aug. 23, 1944, which overthrew Antonescu and brought Rumania into the war against Germany, was largely the work of King Michael himself, supported by the National Peasants and Liberals, but the Social Democrats and Communists were given representation out of proportion to their numbers in the first postarmistice administration. The armistice was signed in Moscow on Sept. 12, Soviet troops having been in occupation of Rumania since the end of August. The peace treaty subsequently provided for their remaining until after the conclusion of the Austrian treaty, a period which would ensure their presence while Rumania was being remodelled on the Soviet pattern. The Russians had prepared during the war a division of indoctrinated Rumanian prisoners named after the hero of 1821, Tudor Vladimirescu; these marched into Rumania beside the Red army.

Until elections could be held, three short-lived governments of a mainly military character took office, the first two were headed by Gen. Constantin Sanatescu, and the third by the chief of staff Nicolae Radescu. Radescu made no secret of his anti-Communist attitude and the Soviet deputy foreign minister, Andrei Vishinsky, came in person to Bucharest to insist on his removal and the installation as premier of Petre Groza, head of a splinter left-wing country party known as the Ploughmen's front which, though not forming part of the national bloc, had been included under Soviet pressure in the last Sanatescu administration. The Groza government, which took office in March 1945, excluded the National Peasants and Liberals and proved highly unpopular. In August of that year the Potsdam conference proposed the resumption of diplomatic relations with Rumania provided that the government was "recognized and democratic." The U.S.S.R. immediately resumed relations, but Great Britain and the United States refrained on the ground of the unrepresentative nature of the Groza administration. King Michael then appealed to the three powers, who, meeting in Moscow in Dec. 1945, advised that a government, broadened by the inclusion of a National Peasant and a Liberal member, should hold elections.

The 1923 constitution had been restored after the armistice, but before the elections a law was passed abolishing the senate. The government bloc announced that it had polled 71% of the votes in the elections held on Nov. 19, 1946. The Communists secured the key portfolios in the new government, excepting that of foreign affairs which was given to Tatarescu, and split the Social Democrats, the bulk of the party remaining aloof under its leader Petrescu, who was later imprisoned. The elections were followed by a wave of arrests of former prominent politicians and their followers, including Maniu himself (Antonescu was shot as a war criminal in 1946). The National Peasant party, which had the allegiance of the majority of Rumanians, was declared illegal

in Aug. 1947. Maniu himself was tried and condemned to life imprisonment in October. The evidence was said to implicate the ministry of foreign affairs and the trial was used as a pretext for the removal of Tatarescu. Ana Pauker, a Moscow-trained Jewess, became foreign minister. King Michael abdicated under Communist pressure in Dec. 1947, two months after the ratification of the peace treaty. In Feb. 1948 the rump of the Social Democrats led by Lothar Radacanu merged with the Communists to form the Rumanian Workers' party which, together with the Ploughmen's front and the Hungarian People's union, made up the People's Democratic front to present a single list in the ensuing elections. These were held on March 28, the front claiming 405 out of 414 seats in the grand national assembly. A constitution on the Soviet model was adopted by the new assembly in April 1948 and the Rumanian People's republic proclaimed. The first chairman of the state presidium (president) was Constantin Parhon.

In the course of 1948 private schools were abolished, industry nationalized and the legal system and the churches brought into line. Peasants secured additional plots, later to be merged in collective farms, in a new land reform put through in 1945 expropriated without compensation all land over 50 ha. The 15,000 owners who had retained this permitted maximum were totally expropriated in March 1949, the 500,000 ha. or more which thus accrued to the state being used for state farms. Collectivization was launched in March 1949 with the accompanying drive against the more prosperous peasantry. The first full five-year industrialization plan was started in 1951. The local boundaries were redrawn and local administration refashioned on the Soviet pattern in 1950; in 1952 the currency, which had already undergone a drastic stabilization in 1947, was adjusted to the rouble. The Rumanian Workers' party purged itself by 18% during 1949; new members were again admitted in Jan. 1950 and by the middle of that year the total membership was put at 1,000,000 out of a population of 15,000,000. The wartime leader Patrascanu was dismissed from the ministry of justice and arrested in Feb. 1948. By the peace treaty, ratified on Sept. 15, 1947, the cession of Bessarabia and northern Bukovina to the U.S.S.R. and of southern Dobruja to Bulgaria was confirmed; in exchange the Vienna award was cancelled and northern Transylvania restored by Hungary.

The Rumanian People's republic now had no independent foreign policy, but followed that of the Cominform to which it adhered when that body was founded in Oct. 1947. A treaty of friendship, collaboration and national assistance was signed with the U.S.S.R. in Jan. 1948, and Rumania later entered into the network of pacts between the different people's republics.

(B. Br.)

POPULATION

The total population fluctuated with the various territorial changes which Rumania underwent. In 1914, before the addition of Transylvania and Bessarabia, the figure was 7,600,000; in 1940, before incurring the losses arising out of the Vienna award and the Soviet and Bulgarian seizures (see *History*, above) it stood at 19,000,000; the 1948 census, reflecting the eventual peace settlements, with Bessarabia and northern Bukovina remaining in Soviet hands, southern Dobruja under Bulgaria but the former Hungarian frontier restored, gave a total of 15,872,624 inhabitants. The 1948 figure represented a density of 173.1 per sq.mi., low compared with western Europe. The net reproduction rate was estimated, however, to be at a high level. The population was distributed among the various provinces as follows: Muntenia (the most densely settled region), 31.4%; Transylvania 21.6%; Moldavia, 16.4%; Oltenia, 13.8% and 16.8% shared by the small border provinces of Crisana, Banat, Maramures, Bukovina and Dobruja.

The rural character of much of Rumania's population is illustrated by the fact that according to the 1948 census only 23.4% of the total lived in urban centres. Rumania is essentially a nation of peasants. The largest town, the greatest manufacturing centre and the capital of the country, is Bucharest (pop., 1939,

684,164; 1948 census, 1,401,827). The two next largest towns, Kishinev (Chisinau) (113,000 in 1939) and Chernovtsy (Cernăuți) (110,000 in 1939) became part of the U.S.S.R. Next to Bucharest in size in 1948 was Cluj (Kolozsvár) (117,915), the important route centre in Transylvania. Several other towns had reached the 100,000 mark by 1948—Brasov (renamed Stalin), Timisoara, Jassy, Braila and Galatz (Galati). The expulsions of Germans, Magyars and Jews decreased the urban population, but detailed figures of the changes are not available. The big increase in Bucharest is partly accounted for by changes in administrative boundaries.

Not only did the total population of the country decrease as a result of the territorial losses, but the ethnographic composition was considerably modified between 1920, when the previous ethnographic details were published, and 1948. In 1920, most of the peasants, shepherds and woodmen were Rumanian, but only 70% of the total population was of that nationality; according to the 1948 census, Rumanians had increased by 2,000,000 to form 85.7% of the total. In 1948, there were said to be 1,499,851 Magyars (9.4% of the total); the actual number was only slightly less than in 1920, the post-1945 expulsions from Transylvania having been suspended later. The third largest element in 1920, the Jews, had then numbered 900,000; in 1948, there were only 150,000, as they had suffered considerably under the Iron Guard and Antonescu regimes—though less severely than the Jews of Poland and Germany—and many of the survivors emigrated to Israel. The fourth largest group, the Germans, declined from 792,000 in 1920 to 343,915 in 1948; they were affected by the wartime schemes of repatriation to Germany and by deportations to the U.S.S.R. in the period immediately after 1944. The Slav group in 1920 was large and included: 792,000 Ukrainians and Russians in Bessarabia; 440,000 Poles, Czechs and Ruthenians in Bukovina and Maramures and 290,000 Bulgars in the Dobruja. The Slavs were much reduced by the Soviet and Bulgarian acquisitions of territory, and the 1948 census recorded their combined total as 200,000. Finally, smaller ethnographic groups, such as Turks, Tatars, Greeks, Albanians and gypsies, numbered about 100,000 persons in 1948. The Turks had been reduced before World War II by the exchanges carried out in the Balkans after 1922.

It is generally accepted that the Rumanians are partly the descendants of Roman merchants and veterans who settled in Dacia, even as far north as the modern Polish border, before and after the campaign of Trajan, and partly of the native Dacians. Archaeological and historical evidence shows that there was a long and thorough period of penetration of the Carpathians by Roman commerce and after the Roman withdrawal the various established Roman elements remained in the country. The very word *batran* in Rumanian, meaning "old," is derived from the Latin *veteranus* and the word *biserica* (church) indicates the western origin of Christianity in these parts (*biserica* = *basilica*) and so the western connections with Italy and the Roman culture. The Rumanian physical type, in many cases, seems more definitely Latin than the Italian and the language is in many respects closer to Latin than is Italian. Slavonic elements are clear in some of the prevalent types but it is by no means the preponderant influence.

The Magyars are found for the most part in the towns of Transylvania. By training, education and tradition they associate themselves more happily with the German elements than with the Rumanian and they take only a small part in the agricultural development of the land. They are industrious and honest but in the past they were regarded as politically unreliable since they were encouraged by their fellow Magyars in Hungary to oppose in every way the rule under which they lived. A branch of the Magyars known as Szeklers were military colonists planted by the kings of Hungary to guard the frontier passes at the head of the Mures and Olt rivers. Those of the Banat were later agricultural colonists.

Germans settled in Rumania from time to time for various reasons. The earliest were knights and their companies, perhaps crusaders, in the 12th century, who were persuaded by the Hungarians to settle in towns that commanded the main passes of the

Carpathians and so prevent inroads of barbarians into Europe. Gradually they developed their settlements and in 1224 their position and independence were recognized. Alsatians and Saxons together with some groups from the Rhineland were settled in these early times. Until 1944 they still lived an exclusive and separate life, largely with their own institutions and local government. They are mainly of the Lutheran persuasion. It is remarkable to see in their churches the one hint of the orient, which they were brought there to combat, in the shape of fine Turkish carpets of the 16th century, survivals of the period when the Turks overran the Transylvanian plateau but left the German settlements still independent. They formed a very useful element in the state and, if rather an isolated enclave in a foreign land, yet were loyal subjects of whatever regime controlled them. The Germans of the Banat are of a different type. They colonized the waste plains of this fertile region in the 18th century and are mostly Rhinelanders and Alsations. Their activities are almost entirely agricultural and their wealth and industry is considerable.

The Turk survivors from the days of Turkish domination, settled mainly in the 16th century. They lived in the remoter districts along the Danube, particularly on the Dobruja coast and near Silistra. They were old-fashioned and recalled the Turkey of the early 19th century; they bore little resemblance to their brethren of the new Turkish republic. The gypsies and Bulgars were the least satisfactory element in the country. The former contributed the attractive traditional Tsigian music and were at least picturesque, but the latter were a difficult element. Both were found mainly in the Moldavian and Dobruja provinces. Bulgar villages were common throughout the Dobruja, intermingled with Tatar settlements and Rumanian hamlets. But the Bulgars there were of a savage type, perhaps descendants from the original Cumans (*q.u.*), of the middle ages. (G. W. S.)

Religion.—The great majority of Rumanians belong to the Orthodox Eastern Church (*q.u.*). No firm evidence of the first coming of Christianity to their ancestors survives, but the fact that most of the basic words of church observance in the Rumanian language are of Latin origin suggests that the first missionaries belonged to the Church of Rome. Dacia was separated from the empire before the conversion of Constantine, but the Daco-Romans later had contact with their kinsmen in Moesia south of the Danube. The beginnings of Christian life were submerged in the barbarian invasions, and an organized church was not founded until the 6th century, when the Bulgarians, then masters of the former Dacia, became Christian and introduced to the province the Slavonic alphabet and liturgy that they had received from SS. Cyril and Methodius (*q.q.u.*). This Slav rite, maintained in the Rumanian Church until the 17th century, helped to keep the Vlach Christians in Transylvania apart from their neighbours, so that, unlike the strongly pro-Papal Hungarians, they followed eastern Christendom against the western in the schism of 1054. When the principalities of Moldavia and Walachia took shape in the 14th century the people were staunchly Orthodox and attached to their Slav rite, though some of the early princes, intermarrying with Poles and Hungarians, temporarily took the Roman Catholic side. Orthodox bishoprics were at once founded in the new states, depending at first on the Bulgarian Church and later on the patriarchate of Constantinople, but having a large measure of autonomy. In Transylvanian Orthodoxy was oppressed, not being one of the four "received religions" and the Orthodox bishop there was dependent on the Walachian metropolitan. Hence the title of the Rumanian primate—*mitropolit Ungro-Vlachia si exarhul plaiurilor* (metropolitan of Ungro-Walachia and exarch of the mountains [*i.e.*, the Carpathians]). The Moldavian and Walachian princes and boyars were exceptionally generous in their endowments to monasteries; in order to protect them in the unsettled conditions under Turkish rule the practice arose of dedicating them to one of the patriarchates of the east or to the holy places. This led to an infiltration of Greek monks. As the source of Slavonic teaching dried up and the village priests knew no Greek, Rumanian gradually became the liturgical language in the 17th century, particularly in the villages. The first Gospels in Rumanian were printed in Transylvania in 1561 under Protestant

nfluence, and the first Rumanian Bible appeared in 1688. The work of Rumanian printers was helped in Moldavia by the metropolitan of Kiev, Peter Mogila, himself of Moldavian origin and one of the leading theologians of the Eastern Church. In Phanarot times, from the 18th century onward, Greek influence spread rapidly, the bishops frequently being Greek and the liturgy being elaborated in Greek in the richer churches.

With the union of the principalities in 1859 the churches of Valachia and Moldavia were united and anti-Greek reaction had all but swung. In 1863 the dedicated monasteries, whose lands covered more than one-fifth of the area of the new state and most of whose revenues left the country, were expropriated, and the use of Greek in all churches and monasteries was forbidden. In 1865 an autonomous Church of Rumania was set up, which in 1872 was given an organic statute, and shortly after Rumania had been proclaimed a kingdom (1881) the Orthodox Church was declared autocephalous and arranged to consecrate its own holy brism instead of procuring it from Constantinople. The oecumenical patriarch protested, fearing that complete ecclesiastical independence in Rumania would lead to an undue growth of Russian influence, but finally agreed.

With the formation of greater Rumania in 1918 the Orthodox Church received many new adherents. In Transylvania there was only one Orthodox bishopric, at Sibiu, which had been granted autonomy in 1869 after former dependence on the Church of Serbia. The majority of Transylvanian Orthodox, soon after the province had come under direct Habsburg rule, had signed an act of union with Rome in Oct. 1608, whereby they kept their own rite but acknowledged the Holy See's jurisdiction. The Orthodox had suffered severe disabilities under Calvinist control and looked to the union as a way of escape. In Bukovina, which had been Austrian since 1775, the people remained Orthodox and had had their own metropolitanate at Czernowitz since 1873. In Bessarabia, the majority of the people were Orthodox and had been under the jurisdiction of the Russian Holy Synod. All these churches united after 1918, and in 1925 the enlarged Church of Rumania was elevated to a patriarchate with the consent of Constantinople, its first patriarch being a Transylvanian, Miron Cristea. With the collapse of the Russian Church in the Revolution the Rumanian Church, with 13,000,000 members, became a leading force in the Orthodox world and took the initiative in many matters of general ecclesiastical interest. In 1936 it recognized Anglican orders.

The old kingdom of Rumania had been relatively homogeneous in religion, but the new provinces brought in a big influx of other denominations. More than 3,000,000 owed allegiance to Rome in 1930, half being Uniates from Transylvania, all of whom were Rumanian by race, and the other half Latin Catholics, mainly Hungarians of Transylvania and Swabians of the Banat. Many of the Hungarians were Calvinist or Unitarian, while the Saxons of Transylvania were Lutheran. In Bukovina and Bessarabia there were many Jews, and in the latter province and in Dobruja there were Mohammedan Tatars.

Under the constitution of 1923 the Orthodox Church and the Uniate Church of Transylvania were declared Rumanian churches, the former being dominant and the latter having precedence over all other denominations. Liberty of conscience was established, and the Jews, the Baptists and other sects suffered under considerable disabilities. A concordat with the Vatican was concluded in 1929. Under the Antonescu regime a decree on the recognition of sects was issued (Sept. 12, 1940) suppressing a number of sects and putting restrictions on Jewish worship.

After the armistice of Sept. 23, 1944, relations between the churches of Rumania and the U.S.S.R., interrupted since 1918, were resumed. The second patriarch of Rumania, Nicodim, died on Jan. 1948 and was succeeded in June by a young bishop, Justinian. Government nominees did not cease to vote for the patriarch for the bishops now that the government was officially atheist. The Communist constitution of April 1948 removed the special privileges of the Orthodox Church. Laws on religion and education in Aug. 1948 ended all church control in schools and laid down that all denominations must submit a statute before being

allowed to function. Under the Orthodox Church statute, 1949, several of the old dioceses were suppressed.

In Oct. 1948 the Uniates of Transylvania were reincorporated in the Orthodox Church and their five bishops were arrested. By 1952 the Roman Catholic Church had not secured approval for a statute. The concordat with the Vatican was denounced on July 17, 1948, and the five Latin-rite bishops put under arrest. The Lutherans, Calvinists and Unitarians secured approval for their respective statutes and the Baptists formed a federation with the other neo-Protestant sects. The different Jewish sects were also amalgamated into a federation of the Mosaic cult, and the Tatar Moslems were put under the muftiate in Constanta. All these recognized religions expressed full loyalty to the Communist government. Apart from the Catholic hierarchy many priests of the Orthodox Church and of other denominations were imprisoned. (B. Br.)

ANTIQUITIES AND EARLY SETTLEMENT

Rumania is rich in antiquities of all periods from the Neolithic to the Roman but no scientific archaeological work can be said to have been done before 1900 when G. Tocilescu published the results of his surveys of Roman Dacia. Excavation by Rumanians did not begin before 1914.

The Neolithic period is hard to distinguish from the Chalcolithic but in general it is abundantly clear that Rumania in the first half of the third millennium B.C. formed part of a homogeneous region in which Bulgaria, Thrace, Thessaly and the Ukraine as far north as Kiev were included. This culture is distinguished by a remarkable painted pottery of high artistic quality in design and shape. The people of this area and period have, for convenience, been called the people of the Black Earth region because the soil is rich and alluvial and because those living upon it at this period were largely agriculturalists.

The most important sites in Rumania hitherto examined are Cucuteni near Jassy where abundant remains were found of two periods of this culture, Erosd in Transylvania and Brasov (Kronstadt), and some sites (excavated by Germans during World War I) near Cernavoda on the Danube. The culture so revealed is one of the most remarkable that developed in Europe in the early prehistoric period. It is thought by some to have oriental affinities with regions as far afield as Turkistan and Honan in China, where remarkably similar pottery is found. In any case the Black Earth culture came to an abrupt end about 2000 B.C. and was replaced by a culture coming from the northeast, whose people had war weapons. The Bronze Age that ensued develops rapidly and concentrates mainly in the western half of Transylvania and the Hungarian plains. It is of great artistic merit and some of the finest products of the European Bronze Age in gold and bronze come from Transylvania. Inhabited sites are numerous but not large and the gold of Transylvania seems certainly to have been worked on a large scale. There was a nobility and a subordinate or serf population and the accoutrement of the nobility and their gold ornaments and plate form an outstanding feature of the civilization they represented. The *floruit* of this Bronze Age seems to have been about the 15th century B.C. and the Hungarian plain seems to have been the breeding place for movements that extended far and wide. Bronze swords of Danubian type from these regions are found during the 14th and 13th centuries B.C. penetrating, perhaps more as signs of invasion than as elements of trade, as far afield as Mycenae, Egypt, Cyprus and Crete. The makers of the swords seem to have been the peoples who were gradually pressing down southward into the Mediterranean and who subsequently were responsible for the northernization of the Minoan world. Their gold may have reached the wealthy cities of the Mycenaean mainland. Certainly they were in close touch with Troy and Anatolia.

Toward the close of the second millennium before Christ the Bronze Age culture of Rumania was modified by external influences and at the dawn of the Mediterranean Iron Age, Italy played a preponderant part in the commerce of the Carpatho-Danubian regions. Villanovan culture from north Italy sent its wares (particularly its fine bronze work), far and wide into Tran-

sylvania and western influence predominated. Rumania proper is almost out of touch with the Hallstatt Iron Age and its Bronze Age does not end until the 8th century when devastating invasions from Scythia entered from the northeast. Scythian graves are found in three large areas—in north Hungary, in south Transylvania and in Walachia. They are never rich and they indicate the intrusion of large bodies of well-armed warriors who for a time controlled the country. They were, however, soon absorbed by the native population. But the wealth and prosperity of Rumania was checked, and never really recovered until Roman times.

Hellenic penetration was marked but never very effective and the Daco-Getic peoples of Rumania were never Hellenized as were the Balkan Thracians. But of the Greek period there are many archaeological evidences. The important Milesian settlement of Histria near the Danube mouth on a lagoon island facing the modern village of Karanassuf has been well excavated. Over 150 inscriptions illustrate the life over many centuries of this remote Hellenic town. The wealth of the inhabitants, as is evident from two large and important inscriptions of the Roman period, had at all times come from the fishing in the delta, over which the Histrians had immemorial rights.

Kallatis, an old Dorian settlement on the site of the modern Mangalia in the Dobruja, was partly excavated. Inscriptions there indicate that the population was strongly Dorian and that the city, with others along that coast, was largely subject to the Thracian-Scythian kings of the interior. Kallatis was evidently one of the great grain-exporting emporiums of the Black sea. Constanta has been identified as the ancient Tomi, the place of exile of Ovid. Remains of the city walls were discovered across the promontory upon which the residential part of the town is built. A small museum which contained all local antiquities was looted by Bulgarian soldiers during 1917 and the contents dispersed. Greek objects of commerce were found as far inland as the headwaters of the Pruth and the Argosul. Wine from Thasos and the Aegean was a much valued commodity in these regions.

The country is extremely rich in Roman remains. The great wall of Trajan can be traced without difficulty between Constanta and the Danube near Cernavoda. Extensive remains of Axiopolis at its western end can be seen on the Danube, and excavations were carried out there. The most impressive of all the Roman monuments is the Trapeum Trajani at Adamkissi. It stands in a wild and desolate region in the rolling steppeland between the Danube river and Constanta with much of its sculptured decoration still lying round the massive concrete core which survives. The Roman town of Ulmetum midway between Harsova on the Danube and the coast has also been explored and excavated. Along the Danube the traces of Trajan's campaigns are numerous. The inscription recording his construction of the road along the south bank near the Iron Gate is still visible in the cliff face near the island of Ada Kalei. Some of the piles of the bridge he built across the Danube still survive.

In Transylvania inscriptions are found as far north as the Polish border and elements of the various fortifications built at different periods can be made out. At the village of Verespatak, near Cluj considerable traces of Roman gold mining are to be seen and a series of important inscribed wax tablets was found there, bearing record to the manner and method by which the mines were worked. Of the Dacians who opposed the Romans there is much evidence but the archaeological discoveries are not of the first importance. The site of Sarmizegetha has been identified in the mountains a little south of Deva in Hunedoara. It is a powerfully fortified hill city and was the metropolis of the Dacians.

Post-Roman remains of the time before the Rumanians came under the influence of Byzantium are rare, and little or nothing is known about the country at this time. The great gold treasure of Petroasa, however, which was transported to Moscow during World War I, is certainly of Hunnish or semi-oriental origin. It consists of two superb chalices of pure gold, inset with large garnets and with handles shaped like panthers, a large necklet of the same material, several large gold ewers elaborately chased

and some superb torques.

Byzantine remains are not of importance until the 14th century when the Byzantine church and monastery of Curtea de Arges was built. The frescoes there rank as the finest and oldest Byzantine works of art in the country.

A special architectural style grew up after this, particularly in Moldavia, based upon the Byzantine, but of a very marked character and of great beauty. It flourished mostly in the 16th and early 17th centuries. The Church of Trei Erarchi (Three Saints) at Jassy, founded in 1639, is one of the finest examples. The style of architecture so evolved is purely Rumanian and owes little or nothing to Greek or Slavonic tradition in matters of decoration, though the structure is in essence Byzantine. Byzantine traditions in painting dominated the artists of the churches and monasteries down to the 18th century. (S. CA.)

EDUCATION

Elementary education in Rumania, both before and after World War II, was described officially as free and compulsory. The remark of the old Rumanian academician, I. Simionescu, describing pre-1939 conditions, remains apposite: "In reality, it is not so free as one would think, because the committees charge a fee for each child: it is not compulsory because the state budget never allows for the setting up of enough schools to accommodate all the children of school age."

A national educational system was a comparatively late development in Rumania, partly because of the lack of a literary form of the language; a system began to take shape in the 19th century but development was most rapid after World War I. In regard to the state-provided schools, in the year 1937-38, 120,516 children were said to be in attendance at infant schools, 2,358,059 at elementary schools, 164,603 at secondary schools; the numbers at private schools were much smaller, being respectively 8,922, 133,184 and 35,922. By 1950, the numbers attending elementary schools were 2,079,357, secondary schools 365,310.

In 1952, Rumania possessed four universities, the same number as in 1939, that at Cernauti (founded in 1875) noted as a centre of germanization, having been lost to the U.S.S.R. and replaced in 1945 by a new foundation at Timisoara. The other three are at Bucharest (founded 1864), Jassy (1860) and Cluj (1872). The university of Cluj was formerly a Magyar institution, but after its nationalization in 1919 had both Rumanian and Hungarian colleges. The superior learned society, the Academia Romana of Bucharest, was founded in 1866 by C. A. Rosetti.

The Communists paid a great deal of attention to the problem of providing an adequate elementary education for the Rumanian people. Their great interest lay in complete control of the young mind and the implantation therein of their particular political beliefs, and the exclusion of other concepts, interpretations of history and so forth that tended formerly to influence the nation in the direction of western thought. Political instruction, in fact, became compulsory at each stage of education. Education was rendered completely secular in 1948, with the abolition of private schools, of religious teaching in school hours and of all the religious orders. The other great concern of the party was the provision of skilled personnel to carry through the ambitious program of industrial development envisaged in the five-year plan. Formerly many foreign experts had been employed in specialist fields, and their place was now taken to some extent by the officials of the various Sovrom companies. Polytechnics are situated at Bucharest, Timisoara, Craiova and Jassy.

ECONOMIC CONDITIONS

Economically Rumania is probably one of the most retarded countries in Europe. The causes of this were essentially political, although Rumania has no large resources of coal and iron (wood, petroleum and water power to some extent making up for the lack of coal). In the past the Rumanian nation felt acutely the effects of the rivalry of the Austro-Hungarian, Russian and Turkish empires. The Rumanians remained penned in the forests and pastures of the Carpathian mountains, and the lower Danube plains, the pioneer fringe of Europe, were not settled perma-

nently until the 19th century. It was not until the 18th century that the Rumanians began to filter into the borders of the Hungarian plain, in the Banat and Crisana.

The comparatively recent emergence of Rumania as a political entity together with the continuing instability of frontiers and of internal politics are factors which tended to exaggerate the lack of economic balance. Resources were exploited rather than husbanded, the more so as German economic imperialism (and to a lesser extent Italian) began to dominate the scene in the 1930s. During World War II the Rumanian oil resources and surplus grains were of supreme importance to the German war machine. After the Soviet occupation in 1944, Germany's position was taken by the U.S.S.R., and Rumanian industries, especially oil, mining, timber, textiles and heavy industries were at the disposal of the Soviet Union. The transfer to the U.S.S.R. of German assets in Rumanian industries and commerce was made law by a Rumanian decree of April 1946. Thus, for example, the largest iron and steel concern, Resita, passed to the Soviet Union and the Soviet State Insurance company took over German assets in Rumanian insurance. Other foreign assets passed to the Soviet Union; e.g., the Hungarian holdings (amounting to 62% of the total) which accounted for about three-fourths of the total Rumanian output. Special Soviet-Rumanian or "Sovrom" companies, with the Soviet Union as the controlling partner, were set up to exploit these assets, and became dominating features of the Rumanian economy; in some services, for example water transport, these companies took the monopoly. The companies set up were as follows: Sovromtransport, Sovromlemn (timber), Sovromchim (chemicals), Sovrommetall (metallurgy), Sovrompetrol, Sovromgaz (oil industry), Sovromsag (insurance), Sovrombanc (domestic and foreign banking), Sovromcarbune (coal mining), Sovromconstructie, Sovromtractor, Sovromfilm and T.A.R.S. (air transport).

The Rumanian economy indeed became completely tied to that of the U.S.S.R. as the Sovrom companies naturally imported Soviet practices and personnel, and set the pace and example for the rest of industry. Under the armistice arrangements, large quantities of Rumanian products, especially petroleum and timber, were paid out to the Soviet Union as reparations—so much so that between 1945 and 1948, when reparations were reduced by 50%, there was little left for export to any other customer. It became necessary for the maintenance and development of Rumanian industry to obtain capital goods not only from the U.S.S.R., but also from the other countries forming the Soviet bloc, especially Czechoslovakia and Poland; even more necessary were the machinery, equipment and technical skills available in the west, particularly in the United Kingdom, France, Italy, Switzerland and Austria. Indeed, industrial firms and experts from these countries had, with those of Germany, played a leading part in the construction and financing of Rumanian industry in the past.

Although surplus supplies of timber, grains, oilseeds, etc., and even some oil, were then made available to the western European nations, trade negotiations were made difficult by Rumania's inability or unwillingness to supply more than a fraction of the former volume of goods, and by her continued refusal to pay compensation for the foreign assets in Rumanian industry. In 1949, Rumania joined the Moscow Committee of Mutual Economic Assistance, and the annual trade agreements signed in Moscow, as well as the first five-year plan, all contributed to the further development of the new trend in the Rumanian economy.

Statistical data concerning economic developments in Rumania have always been regarded with some reserve, because of the difficult administrative and political conditions in the country. After 1945, little detailed statistical information was published. Pronouncements by the Rumanian Communist leaders and by the Cominform bureau, which set up its headquarters in Bucharest, confirmed that the trend toward closer integration with the U.S.S.R. was continuing undiminished. An official press statement issued in 1950 announced that the Soviet bloc's share in Rumanian foreign trade had increased from 19% in 1938 to 73% in 1948 and 81% in 1949; over the same period the western countries' share decreased from 81% to 27% and 19% respec-

tively. Soviet-Rumanian trade in 1950 was to increase by a further 30%.

Planning.—Rumania followed closely the pattern of economic reform set after 1944 throughout the Soviet-dominated sphere of Europe. In Rumania's case, this pattern was set by the establishment of the Sovrom companies and by the control exerted upon the government by the Soviet representative on the Allied Control commission in Bucharest. After the signing of the peace treaty and just before the withdrawal of the bulk of the Soviet forces, communication was speeded up by the expulsion of King Michael and the final seizure of power by the Communists.

In agriculture, the road to collectivization had already been prepared by the reform of 1945, and collectivization itself put into operation fully after the 1949 reform. In industry, state control was not unfamiliar—in the Carolist period and under the nazis, it was applied to a great extent to the major industries and to transport. After 1947, privately owned industry, commerce and finance, and western types of trade-union organization, social welfare and cultural activities were gradually destroyed by communist reforms. By 1952, industry, transport and communications were the property of the state, controlled directly by it or by the various Sovrom companies. The establishment of state distributing agencies, state and municipal stores, state banks and insurance companies, the communist-controlled peasant associations, the Central Co-operative administration and General Confederation of Labour, together with state-owned information, propaganda and educational services, completed the transformation of Rumania.

In June 1948, a law was passed nationalizing the subsoil rights, industry, banking, insurance, mining, transport and telecommunication undertakings. This was followed immediately by the establishment of a supreme State Planning commission and the reorganization of the existing industrial boards into state industrial centers for each industrial group. An important survey of industry and housing was carried out in Nov. 1948. The national plans of economic rehabilitation which covered development from July 1947 to Dec. 1950 eventually culminated in the first five-year plan, for the years 1951–55. The lack of coal as a source of power to supplement the oil and wood supplies, and the existence of a considerable hydroelectric potential, encouraged the planners to undertake a special ten-year electrification plan for 1950–60, which was to include the electrification of the Stalin (Brasov)-Bucharest industrial region and to achieve an annual output of 2,600,000 kw.

TABLE I—Rumanian Production, 1938, and Targets, 1955

	Production 1938	Target 1955
Crude oil (metric tons)	6,594,000	10,000,000
Electric energy (kw hr.)	868,000,000	4,700,000,000
Aluminum (metric tons)	—	5,500
Steel (metric tons)	277,000	1,250,000
Coal (metric tons)	2,350,000	8,513,000
Sulphuric acid (metric tons)	43,000	743,000
Natural gas (cu m.)	1,860,000,000	3,000,000,000
Bread grains (metric tons)	5,410,000	5,740,000
Malae (metric tons)	5,213,000	40,910,000
Sugar beet (metric tons)	790,000	1,115,000
Cotton (metric tons)	1,400	239,000

The cumulative effects of such planning were to be noticed in the continuing scarcity of food and other consumer goods. Rationing was carried out according to the communist interpretation of political and economic "usefulness" of various classes of consumer. The cost of living increased enormously between 1944 and 1947. The government, facing great financial difficulties after World War II, introduced a measure of currency reform in Aug. 1947 which did something to stabilize prices but which was also used as a lever in the class war. Under the reform law one new leu was exchanged for 20,000 old lei; but whereas wage earners, civil servants and salaried persons were allowed to exchange up to 8,000,000 old lei, the farming class was allowed up to 5,000,000 and all others only 1,500,000. Assets in excess of these amounts were deposited in frozen amounts with no interest.

The new rate for the leu was fixed at U.S. \$1 = 150 lei. This was only a temporary measure, and the leu was finally tied to the rouble and

to the Soviet economic system by a reform introduced in Jan. 1952; instead of the former rate of 37.4 lei to the rouble, a rate of 2.80 lei to the rouble, or 4 lei to the U.S. dollar was now fixed.

AGRICULTURE

Farming and forestry continue to be of great economic importance. In 1948 more than 75% of the total population was still engaged in rural pursuits. The years immediately following the Soviet occupation of 1944 were overshadowed by the aftermath of war, and what surpluses there were of Rumania's traditional exports of cereals, oilseeds and timber were earmarked for the U.S.S.R. In 1946 a serious drought reduced the maize crop (the staple food of the peasants) and relief ships carrying grain from the U.S., the U.S.S.R. and Argentina reversed the normal direction of trade. The return to stable conditions was prevented by the land reform laws of 1945 and 1949 which were but a prelude to the large-scale application of communist collectivization methods. After 1948 Rumania offered only certain restricted quantities of cereals and other foodstuffs to its former customers in the west, such as the U.K. and Italy.

The farming areas fall into several natural regions: (1) the Carpathians are given over mainly to forestry, but are noted for the old-established summer pastures—the *plaiuri*—above the timber line. Under settled conditions, transhumance—the seasonal migrations of men and animals—was also practised by the peasants of the Danubian plains who sought out the hill pastures of northern Dohruja. The mountain sheep pastures are the basis of the home wool production, which is usually enough to provide for the manufacture of the coarse woollen garments worn by the Rumanian peasants. The Carpathian settlements are of the characteristic line type, often strung out for five or six miles along the valleys; the houses have high-pitched roofs and thick carved beams. (2) Transylvania, an upland, hilly country with a harsh climate and forest, has mixed farming, producing the cooler grains, oats and rye, and much cattle and other livestock. (3) The piedmont zone of the Banat and Crisana are more akin to the Hungarian plains, the Banat producing large quantities of feeding grain for its pigs. (4) The Carpathian foothill zone in Moldavia and Walachia is a verdant country with mixed farming, vineyards, plain orchards, groves of walnut trees and market gardens. (5) The Moldavian and Walachian plains slope gradually down to the Danube, and are steppe-like and in part even semiarid. This is the region of concentrated settlements, of extensive farming, of occasional famine and outbreaks of pellagra, of large-scale wheat production, maize, sunflowers, rape, soya, tobacco, cotton and hemp. The largest areas of oilseed and industrial fibre production were lost when Bessarabia was annexed by the U.S.S.R. (6) The Danube flood plain produces a certain amount of rice. The lower Danube, in the shallows and lagoons below Giurgiu and in the delta itself, has an important fishing industry, specializing in carp, sturgeon, the black caviare from sturgeon, crayfish, etc.

TABLE II.—Annual Production of Principal Grains
(In thousand metric tons)

	Wheat	Maize	Barley	Oats
1937-1951 average*	9,437.7	3,651.3	1,468.3	611.8
1941	9,552.0	3,664.0	381.2	510.2
1945	1,068.7	1,004.0	233.4	289.3
1947	3,276.0	5,276.0	360.0	...
1948	2,902.0

*Within Jan. 1938 frontiers.

†Within Jan. 1941 frontiers

The principal categories of land utilization are as follows (in thousand hectares, 1948): arable, 9,757; forests, 6,705; pastures, 2,820; meadows, 1,605; farmyards, 618; vineyards, 227 and orchards, 221.

Agriarian Reform.—As in other countries of eastern Europe, the rapid growth of the peasant population, the survival of feudal systems of tenure and servitude, and the growing demands for export foodstuffs arising from the industrialization of western Europe, combined to produce in Rumania in the latter part of the 19th century an acute agrarian problem. It was only in the remoter hill regions that there appears to have been any development of free peasant communities—the *raioni* and *moieni*. The majority of peasants were serfs, or *rumani* as they were commonly termed, bound to the boyars, who with the churches had come by the 18th century to be the greatest landowners. The pressure placed upon the semipastoral peasants to produce larger and larger grain crops for export as the 19th century proceeded was a great cause of tension. Absenteeism increased, as did also an insidious form of speculation in large-scale tenantry and subletting. Peasant revolts in 1821, 1848 and 1907 were the outcome of these varied political, social and economic conditions.

After the emancipation of the peasants in 1864, they were granted from time to time allotments from crown lands, but such grants were never sufficient to satisfy the general land hunger. Distribution was equally unsatisfactory in the case of Bessarabia under the Russian and Transylvania under the Austro-Hungarian empire, but the Bukovinian peasants had been more fortunate in obtaining possession of a considerable share of the land. It was found expedient in 1920 to pass an expropriation law for Bessarabia, which was rapidly followed by similar laws for the old kingdom (1921) and for Transylvania and the

Bukovina (also 1921), whereby provision was made for the total expropriation of absentee landlords, foreigners, mormaen estates and for partial expropriation of large landed properties. The thousands of peasants who took over the land in the first years of the agrarian reform were unskilled in management, inadequately organized on the co-operative side and lacked both the machinery and capital required for successful farming.

Under the Communist regime, two further land reform acts were passed, that of 1945, mainly concerned with the expropriation of

TABLE III.—Number of Holdings of a Given Area as a Percentage of Total Number*

Area (ha.)	1907	1941	1948
0-½	0.34	7.3	7.3
½-1	0.93	9.3	9.5
1-3	1.0	10.0	10.0
3-5	17.16	19.3	23.3
5-10	14.55	19.5	17.6
10-20	8.80	5.1	4.7
20-50	5.02	0.7	0.4
More than 50

*The 1907 figures apply to the old kingdom; the 1941 and 1948 figures exclude northern Transylvania although covering more than 10,000,000 ha., three-quarters of which was arable land, while the 1948 figures apply to 2,600,000 holdings covering 17,000,000 ha. less than was arable. The table does, however, serve as a guide to the process of "parcelization" prior to the commencement of the collectivization drive.

private properties in excess of 50 ha. and the properties of certain categories of individuals such as Germans, war criminals, etc., and that of 1949, when the remaining property of the large landowners was confiscated. The 1945 act was followed by the distribution of land to the landless and the poorer small landholders, but the whole aim of the Communist reforms was to replace the old system by one of peasant ownership but one of collective farming on the Stalinist model. The liquidation of the *kulak* (*chiabur* in Rumanian), or larger peasant farmer, went hand in hand with the development of collective farms. In 1949 there were about 50 collectives; in 1951 there were more than 1,000. The large estates of the past and the small peasant holdings still in existence were being gradually converted into the large state farms and collectives, the *sovkhozes* and the *kolkhozes*, which were the ultimate objectives of the Communist agrarian policy.

Timber Industry.—The forests of the Carpathian ranges and foothills of the Transylvanian uplands and of the better-watered lowlands provide Rumania with one of its most valuable resources. In 1938, about 10% of the country's workers were connected with forestry, and timber exports were the third most important after oil and grain. It provides an important source of fuel, supplementing the oil supply and the scanty coal resources. Associated industries, such as furniture making, pulp and paper, and cellulose are to be found at a number of suitably located centres such as Stalin (Brasov), Busteni, Bacau and Timisoara.

The species belong mainly to the broadleaf forest types of southern Europe—oak, beech, ash, hornbeam, lime, alder and willow. Beech is most widespread in the hills and oak is the commonest tree in the lowlands. Conifers cover only one-quarter of the forest area and are found mainly in the northern and eastern ranges at higher levels, between the deciduous forests and the alpine pastures of the summits.

The forests were overcut during and immediately after World Wars I and II. In the interim period there was also some deforestation resulting from the distribution of holdings to peasants under the land reform acts. In the same period, the state owned about one-third of the forest wealth, communes and churches owned a similar proportion, and companies and private individuals owned the remainder. By 1952, exploitation was being shared by Sovromleim and the Rumanian state. Besides annexing valuable stands in northern Bukovina, the U.S.S.R., through Sovromleim, carried out new development work in southern Bukovina and northern Moldavia.

Oil Industry.—The oil-bearing strata are found in a crescent-shaped belt running along the edge of the Carpathian foothills zone in Muntenia and Moldavia. Even before oil became the leading industry, this belt was one of the most populous in Rumania, and many peasants supplied seasonal labour to the oil producers. The chief producing regions are Bacau, Bazau, Prahova and Dambovitza. Most of the refineries are situated in Ploesti, the oil capital, from which pipe lines go to the oil ports of Constanta and Giurgiu.

Natural gasoline had been used locally, but it was not until 1854 that the production of petroleum began on a commercial scale. Production increased steadily, except during World War I, until a peak of 8,700,000 tons (3.5% of world production) was reached in 1936. Rumanian geologists estimated in 1937 that reserves would last for ten years, but the decline which set in after the 1936 peak was largely the result of dislocation caused by World War II. Oil technicians from western Europe and the U.S. who had been largely responsible for the development of the industry, were no longer available; and after 1945, the position in this respect did not change. Lack of technical skill and equipment held up production, although prospecting and drilling were carried out with increasing vigour especially after the five-year plan started in 1951. According to this plan, the 1936 peak

was to be reached in 1952, and 10,000,000 tons of crude petroleum was the target for 1955. Statistics of production were not made available after 1942, but estimates for the years 1944-50 are as follows (in millions of tons): 1944, 3.5; 1945, 4.6; 1946, 4.1; 1947, 3.7; 1948, 4.1; 1949, 4.3 and 1950, 4.4. By 1952 Rumania was still the largest producer in Europe.

In 1938, about 60% of Rumania production was either owned or controlled by Germany, about 10% by Great Britain (Unirea company), 12% by Anglo-French interests (Socata Romana), 10% by Rumania, 5% by Italian and 3% by various small Anglo-French-Belgian firms. Sovrompetrol took over the German share at the time of the Soviet occupation, and the rest was confiscated by the Rumanian government and placed under two state centres named Muntenia and Moldavia. No compensation was paid to the owners expropriated; countercharges of sabotage, the levying of large fines and the arrest of foreign experts by the Rumanian government hindered production.

Oil had become the chief Rumanian export before 1938, replacing the export of cereals in that position. In 1938, the value of oil exports was 43% of the total exports of 11,500,000,000 lei. The almost exclusive dependence of Rumania on these two commodities—the one exploitive and relying on foreign skill and capital, the other requiring extensive farming in an area often subject to crippling droughts—gave Rumanian economy its precarious nature. Thus in 1946-47 the food position, as a result of bad weather, was so serious that much grain had to be imported, and oil production fell to the 1927 level. Oil exports in 1938 went to all the countries in Europe (Germany 700,000 tons, United Kingdom and Italy 500,000 tons each, France and Czechoslovakia 300,000 tons each), and to North Africa as well. After 1944, exports were almost exclusively to the U.S.S.R., small quantities going to the other Soviet bloc countries, especially Czechoslovakia, Poland and Hungary. After 1948, small quantities were offered to other former customers, such as Italy and Great Britain, as the need for re-equipping the industry made itself felt.

No country in Europe was, at mid-20th century, so dependent upon oil for home consumption as Rumania, a position emphasized by the shortage of coal. Fuel oil was consumed on a large scale by industry, the railways, power stations, by the shipping services and for central heating, milling and agriculture. The need to conserve this most valuable resource was evident when petrol rationing was reintroduced in 1950. The armed forces were also taking an increasing amount.

In 1947, when it was estimated that Rumania produced about 3,700,000 tons of crude petroleum, the output of natural gasoline was about 114,000 tons. In addition to this, Rumania possesses the largest source of natural gas in Europe, with a production in 1947 of about 42,000 tons. It is methane, found near Medias, Copca Mica and Sarmasel in the Transylvanian basin, and is widely used for lighting and heating purposes.

Coal, Iron and Steel.—Rumania has no large resources of coal and iron, and heavy industry is therefore on a restricted scale, entirely dominated after 1945 by the Sovrom companies. Coal production in 1947 was given as 2,200,000 tons, and in 1948 as 2,600,000 tons. Iron ore production in 1947 was about 100,000 tons; in 1950, according to estimates, it was about 390,000 tons.

Coal production was as follows in 1947: brown coal 1,632,456 tons; lignite 439,674 tons; bituminous coal 137,173 tons and anthracite 23,404 tons. The most important field is in Oltenia, in the upper Jiu valley in the southern Carpathians centering on Petrosani, producing anthracite and lignite. The hard coal, some of which is suitable for coking, is found toward the western end of the Carpathians in the Arina-Resita area of the Banat. Other fields of brown coal are found in the foothills in Muntenia (Filipesti), Transylvania and Moldavia (Comanesti).

The deposits of iron ore, mainly limonite (47% to 54% iron) and siderite (28% to 35%) are small, and are found chiefly in the vicinity of the metallurgical centers of Resita and Hunedoara. Also the dependence of relations with Yugoslavia, the Rumanian iron and steel industry became almost completely dependent on Soviet ores. Imported scrap is also a vital necessity. The centres of heavy industry are Bucharest (machinery, machine tools, agricultural equipment, locomotives, railway wagons, pipes, etc.); Resita (iron and steel, armaments); Hunedoara (iron and steel) and Brasov (tractors, aircraft, armaments, machinery, locomotives, etc.). Under the five-year plan, a new steel centre was set up at Campia Turzii near Cluj.

TABLE IV.—Iron and Steel Production
(In metric tons)

	1938	1946	1950*
Pig iron and ferroalloys	107,000	54,000	330,000
Steel ingots and castings	190,000	104,000	540,000
Iron ore	157,000	106,000	275,000

*Estimated.

Other Minerals.—In 1948, as part of the communist plan for nationalizing industry, the mining of precious and nonferrous metals was put in charge of a separate central division, headquartered at Sat Mare, northern Transylvania, and Brad, in the Bihorului moun-

tains of central Transylvania. The first district has gold, silver and lead mines as well as processing and refining plants, the second possesses gold, silver, lead, zinc, bauxite and mercury mines, with plants for processing, refining and distilling, and for the mass acture of chemicals. Rumania is normally self-sufficient in lead, but needs to supplement zinc supplies by imports from Poland. Gold production in 1947 was 71,728 fine troy ounces, Rumania ranking with Sweden as one of the leading producers in Europe. Bauxite production was never on a large scale, and aluminum production was on an experimental basis, at least until 1939. Other products are mica, chromium and manganese.

The Tertiary rocks of the Transylvanian basin and the foothills of the Carpathians in Oltenia and Moldavia contain vast reserves of salt; extraction is carried on at Ocnele Mari on the Olt Slavic in the Prahova valley, and Targu Ocna.

Communications.—Compared with those of western Europe, transport and communication standards are low. Up to the 1930s political and economic conditions had prevented a great development of roads and railways, the former were few indeed, and the oxcart and unmetalled track were a more familiar sight than the motorcar and surfaced highway; most railways were single track, with the exception of certain sections of the Orient Express route, notably from Bucharest to Stalin, and parts of the Bucharest-Braila line.

The Germans attempted during World War II to improve certain road and rail communications in order to make Rumanian resources, petroleum, minerals and timber, more easily accessible; to enlarge facilities on the Danube at minor ports to relieve congestion at the bigger ones; and to aid the flow of military traffic across the Danube into Bulgaria. In the period after 1945 similar operations were undertaken with the difference that trade was now directed not toward Germany and the western European countries but mainly toward the U.S.S.R. and the other Soviet bloc countries. The new railways were extended into the Jiu coalfield and into the forests of the Moldavian Carpathians.

The Danube.—Besides being the main artery of trade in Rumania, the Danube forms such an important thoroughway that, after the treaty of Paris of 1856, it was subject to some form of international control. From Braila to Ulm (1,474 mi.) it was supervised by the International Danube Commission (C.I.D.); from Braila to the sea at Sulina by the European Danube Commission (C.E.D.). Both the C.I.D. and C.E.D. were reconstituted by the treaty of Versailles. The C.I.D. had representatives of the riparian states and France, the United Kingdom and Italy; the C.E.D. had representatives of Rumania, France, the U.K., and Italy (Germany was admitted in 1938). A meeting was called in 1948 by the United States government to consider the establishment of a new supervisory body; invitations were sent by the state department to the U.S.S.R., the Ukrainian S.R.R., Great Britain and France, and to the riparian states (including Austria but excluding occupied Germany). The Soviet Union and its supporters carried through the meeting, and a new Danubian commission at Galatz (Galati), from which western and Yugoslav representatives were excluded, the Sovromtrans control the entire Danube navigation within Rumania, including the delta section, and the ports and shipbuilding yards at Turnu Severin, Giurgiu, Galatz and Braila, as well as the only Rumanian Black Sea port of any size, Constanta.

The Danube is navigable throughout its whole length in Rumania, but there are two distinct sectors for traffic—seagoing vessels of 2,000-3,000 tons go upstream as far as Braila and Galatz, and river vessels ply on the rest. Heavy-draught shipping does not enter the Danube but docks at Constanta, as the Sulina bar needs constant dredging to maintain a depth of water of 22 to 23 ft. In the Iron Gate gorge, between Turnu Severin and Orsova, specially skilled pilots and smaller tows of barges are required to navigate the reefs and rapids, but below Galatz the current is slight. Ice blocks the river during about three winters out of every ten, the blockage lasting sometimes from mid-December to March; occasionally late summer droughts close the river in the autumn. In the autumn the Danube has a steep bank on the Bulgarian side but on the left bank below the Iron Gate gorge the flood plain, with its marshes and lagoons, is several miles wide. The railway bridge carrying the Bucharest-Constanta line across the Danube at Cernavoda is 73 mi. in length; the next bridge above this is in Yugoslavia, at Novi Sad. No bridges cross from the Rumanian to the Bulgarian side; the chief road ferries are at Resita, Siliistra and between Giurgiu and Ruschuk (Ruse), the latter crossing being the site of a proposed new bridge. Another project, the Danube-Black Sea canal, first publicized in 1949, was reported to have been begun soon after but, like the Oder-Danube canal, appears to have been delayed by the lack of equipment. This new waterway would save the long detour of the delta and the Sulina bar by linking Cernavoda to a point a short distance north of Constanta on the Black Sea coast.

Traffic remained at a very low ebb between 1945 and 1948, but increased subsequently with the development of trade between the Soviet-bloc countries. The goods carried consist mainly of Soviet iron ore destined for Czechoslovakia, Hungarian bauxite and Rumanian timber, oil and cement for the U.S.S.R.

Ports.—The ports tend to specialize according to their hinterland and harbour facilities. Thus Constanta is the chief oil port, handling about three times the quantity exported through Giurgiu; both are connected with Ploesti by oil pipe lines. In addition Constanta is the maritime port of call. Braila is the chief grain port, and Galatz, besides

being the main port of entry and principal naval base, handles most of the timber which is floated down the Siret or comes by rail from Bukovina and Moldavia.

The pre-1939 Rumanian shipping lines connecting with Levantine and Mediterranean ports, although reopened after World War II, were in 1952 still operating on a reduced scale.

Finance.—The economic and political conditions peculiar to Rumania have been nowhere more apparent than in the financial sphere. Although the country possesses considerable man power and natural resources, a certain lack of balance and an emphasis on exploitation rather than conservation always characterized the country's economy.

The want of settled conditions, coupled with the tendency to concentrate upon the development of a few specialized cash crops (grain, timber, oilseed) and petroleum for export, maintained the country as a whole at a very low general standard of existence. Foreign investment which was needed to bring Rumania into a more typically European level was attracted to more tangible short-term projects, and this is true not only of the later German economic penetration but also of the post-1945 Soviet attitude. The bulk of the population was peasants, and remained so in mid-20th century. In 1928, it was calculated that the capital engaged in peasant farming for one out of every three in Poland and only one-tenth of that in Switzerland. The five-year plan paid more attention to investment in certain specialized heavy industries than to any general plan which would benefit the people as a whole.

During the 1930s, the financial situation was dominated by the sharp drop in world agricultural prices, and the mounting foreign debt which by 1935 had risen to 80% of the total national debt of 139,000,000,000 l. A temporary improvement was more than offset by the deterioration caused by general rearmament in the late 1930s. After 1945, and before reparations payments were reduced by the U.S.S.R., a serious degree of inflation resulted. Two currency reforms ensued, the first in Aug. 1947 when 50,000 old units were made exchangeable for one new lei, and the second in Jan. 1951. The latter pegged the Rumanian currency officially to the Soviet rouble, and one new lei was exchanged for 37 old ones. In carrying out these reforms, not only was Rumanian economy made entirely dependent upon that of the U.S.S.R., but class warfare inside Rumania was furthered. Private financial power was destroyed, and the independent farmer, craftsman, manufacturer and professional man was reduced to a position of complete dependence upon the state. At the same time, the real value of wages was not increased; scarcities and rationing were the order of the day. The majority of Rumanian banks were dissolved in Aug. 1948, and a few months later the National Bank of Rumania was transformed into the Bank of the Rumanian People. Apart from certain co-operative and savings banks, which were all placed under state control, the powerful Sovrombank was set up to conduct the business of the various Sovrom companies.

The 1951 national budget estimates were as follows (in millions of lei): revenue 433,900, expenditure 429,900.

DEFENSE

After 1945, Rumania formed an integral part of the Soviet defense system in eastern Europe. The country was occupied by a large Red army force until the signing of the peace treaty in 1947, and certain numbers were maintained there subsequently. The new Rumanian army was rebuilt around the three divisions of Rumanian prisoners of war who had been trained in the U.S.S.R. and crossed the frontier as liberators alongside the Soviet troops.

The peace treaty laid down that the Rumanian armed forces should be restricted to the following: (1) land forces (including frontier guards) of up to 120,000 men; (2) anti-aircraft artillery with 5,000 men; (3) an air force with 150 aircraft, of which not more than 200 might be for combat, and a personnel of 8,000 and (4) a navy of up to 15,000 tons and 5,000 men.

By 1952 the total numbers under arms including security police and other quasimilitary forces had, according to generally accepted estimates current in the western press, risen to more than 400,000 or more than three times the peace treaty level. In addition, Soviet forces occupied certain positions in Rumania, and formed part of the "Cominform cordon" lined up along the Yugoslav frontier.

Rumania continued to keep small naval forces in the Black sea and on the Danube. In 1951, the former were said to consist of two old destroyers, one submarine and one submarine depot ship, two old torpedo boats, two motor gunboats, two motor torpedo boats, one mine layer and one training ship; the Danube flotilla comprised four monitors and an assortment of small craft.

RUMANIAN LANGUAGE AND LITERATURE.

Latin was introduced into the farther end of eastern Europe at the time when Trajan's legions occupied Dacia (A.D. 101-107). The natural riches of this region attracted settlers from all points of the Roman empire. In A.D. 274 Aurelian determined to withdraw all the Roman legions and likewise part of the civilian population menaced with disaster by the constant incursions of the Goths, and from the 3rd to the 6th century Rumanian evolved normally maintaining touch with Western Europe through Illyria and especially Dalmatia. In the course of the 6th century, however, it was cut off from the Latin world by the invasions of the Slavs and Bulgarians, while the bulk of the Rumanic population was compelled to seek shelter in places less exposed to barbarian attack. Dalmatia was the worst sufferer; Salona, the most important city in that province, was occupied and partly destroyed, its inhabitants fleeing to the coast and islands of the Adriatic. Slav influence bore heavily on the conquered, who received from their victors a liturgy and an alphabet (the Cyrillic alphabet which the Rumanians retained till the latter part of the 19th century when they adopted the Roman alphabet). The constitution of the Rumanian language was also profoundly affected. It is from the Slav invasion that Rumanian starts upon its peculiar course of evolution and begins to acquire those characteristics distinguishing it from all other Romance languages. The centre of formation of Rumanian, which till the 7th century had been north of the Danube, followed the drift of the population and was transferred south of the river. But, as a result of slow migrations of which the history is barely known and which lasted from the 9th to the 12th century, we find in the 13th century two groups of Rumanians, one, the more important, north of the Danube, the other, much less considerable, south. From the 13th century onwards the northern group again becomes the main centre of language formation. To these two groups must be added a third in certain parts of Istria whither Rumanian was brought by successive migrations of settlers north of the Danube between the 10th and 14th centuries.

At the present time Rumanian is divided into four dialects: (1) Daco-Rumanian, spoken by some 12,000,000 persons in Wallachia, Moldavia, Bessarabia, Transylvania, the Banat of Temesvár, Bukovina and in some places on the right bank of the Danube, the Dobruja in particular; (2) Macedo-Rumanian, spoken by about 600,000 Armini in portions of Macedonia, Albania, Thessaly, Epirus; (3) Meglenitic, spoken northwest of Salonica; (4) Istro-Rumanian, spoken by about 3,000 persons at the beginning of the 20th century (number rapidly diminishing in the villages of Soussinévista, Lettay, Gradigné, Grobocje, Brdo, Noselo and Jéane. Speakers of this dialect have entirely disappeared at Squitasta and in the Arsa valley. They are known as Tširibiri by the Italians and Slavs; their language is called vlaški or tširibirski.

The vocabulary of Rumanian is a mirror of the history of the

Rumanian people. Its basis is a development of Vulgar Latin; to this have been added in the course of centuries elements from the languages of the various populations with which the Rumanians have successively lived on friendly or hostile terms: Albanians, Byzantines, Bulgarians, Serbs, Hungarians, Poles, Turks. The most important added ingredient is Slavonic. It has ousted many words of Latin origin relating to the most ordinary manifestations of life, human activities and social conditions: relationship, parts of the body, animals, plants, metals, implements, etc. The affirmation itself *da* is borrowed from the Slavonic.

Slavonic has altered the sounds of a few words, introduced novel reflexive forms, and in composition and derivation played a very important rôle. The Latin negative prefix *en* has, for instance, been replaced by the Slavonic *ne*, e.g., *nebătut, necertat, neegal*. The Latin prefix *dis-*, expressing separation, has given place to Slavonic *rasit, e.g., răsi*, instead of Latin *dis-solvere, risipi* instead of Latin *dispergere*. Slavonic has also introduced a few suffixes such as *-că* (old Bulgarian *ika*) e.g., *săteancă* (country-girl); *-nic* (old Bulgarian *iniku*) e.g., *fălnic* (proud, presumptuous). The element next in importance is Magyar, present, however, in Daco-Rumanian only, to which it has given not only words but also some suffixes: *-aş, -iş, -uș, -șag, -șug*.

Among the characteristic features of Rumanian are the following:

1. Lat. *au* has been preserved as a diphthong (as in Sardinian, in part of Provençal and the Grisons dialect) e.g., *E. aurum, Rum. aur; L. audere, Rum. auzi*.
2. Lat. open *e* has become *i* even when in closed syllable (as in Spanish and Friulan) e.g., *L. perdit, Rum. pierde*.
3. Lat. *e*, open *e*, and *o* followed by *n* have become respectively *i*, e.g., *L. canto, Rum. cînt; L. bene, Rum. bine*; and *u*, *L. carboneum, Rum. cărbune*.
4. Lat. tonic *e*, *o*, preceding a syllable with open vowel became first respectively: *ea, oa, e.g., L. directa, Rum. dreaptă, L. porta, Rum. poartă*; this *ea* has been reduced in Daco-Rumanian at times to *a*, at times to *e*, e.g., *L. legem, Rum. lege* (formerly *lege*). *L. mensa, Rum. masă* (formerly *measă*) but has been maintained in Macedo-Rumanian: *oa* has generally remained without alteration in Daco-Rumanian as in *voastră* but has been confused with close *o* in Istro-Rumanian.
5. Lat. intervocalic *i* has passed to *r* (as in some Italian dialects, in Ladin, in Franco-Provençal and in Vaudois), e.g., *L. flum, Rum. fir; L. mola, Rum. moară; L. gula, Rum. gură*.
6. Lat. *qua* and *gua* have respectively become *pă* and *bă*, e.g., *L. aqua, Rum. apă; L. equa, Rum. iapă; L. lingua, Rum. limbă* (compare Logudorese *abba* and *limba*). This modification which is normal in the word appears at times in the initial syllable, e.g., *L. quattuor, Rum. patru*.
7. Lat. *Kt, Ks*, have respectively become *pt, ps*, e.g., *L. lactem, Rum. lapte; L. coxa, Rum. coapsă*.
8. Lat. *Sh, e, i*, has become *shi, e.g., L. piscem, Rum. pește*.
9. Lat. intervocalic *b, v, ll* (in group vowel *-lla*) have disappeared, e.g., *L. caballum, Rum. cal; L. lavare, Rum. la; L. stella, Rum. stea*.
10. In the Istro-Rumanian dialects and, till the 17th century in Transylvania (as in parts of Franco-Provençal) Lat. intervocalic *n* has been changed into *r*, e.g., *L. lana, I.-R., Tr., lare; L. manum, I.-R., Tr., marg; L. virum, I.-R., Tr., virg*.
11. There still exists a system of declensions of substantives and adjectives with five cases: *N., V., Acc., Gen., Dative*.
12. The definite article is put after the substantive, e.g., *lup, lupul, lupului, lupilor*.
13. The formation of the numerals from 11-90 proceeds upon the Slav system. (a) From 11-19 *spre* (*L. super*) is inserted between 1, 2, 3, 4, 5, 6, 7, 8, 9 and *zeci*, 10, e.g., 11, *unsprezece*; 12, *doisprezece* (masc.) *douăsprezece* (fem.); 13, *treisprezece*. (b) From 20-90 *zeci* (10) is added to 2, 3, 4, etc., e.g., 20, *douăzeci*; 30, *treizeci*. The ordinals are formed by adding to the corresponding cardinals the ending *-lea* (masc.) and *-a* (fem.) e.g., *al doilea*, the second (masc.), *a doua*, the second (fem.), *al unsprezecelea*, the eleventh (masc.), *a unsprezecea*, the eleventh (fem.). *Întîiul* (from *L. antaneum*) or *cel dintîiul* (masc.); *întîia* or *cetî*

dintîiul (fem.) means the first.

14. All infinitives have shed the final posttonic syllable of Vulg. Lat. e.g., *a aduna, a tăcea, a începe, a fugi*. These infinitives are those of the four conjugations existing in Rumanian.

15. The future present is formed by the infinitive of the verb to be conjugated, preceded or followed by the present indicative of *a voi*. In colloquial Rumanian it is often expressed by the present indicative of *a avea*, followed by the conjunction *să* and the verb in the present subjunctive; or the present indicative of *a avea* may be replaced by *o* which is invariable. The following examples give the four different ways of expressing this tense: *voi ruga, ruga-vă, am să rog, o să rog* (I shall pray).

16. The passive is expressed by a special construction of the subject with the reflexive form: e.g., *Mănăstirea s'a zidit de Ștefan cel Mare* (The monastery has been built by Stephen the Great). Another construction, more modern, is similar to the one to be found in other Romance languages: e.g., *Sunt bătu* (I am beaten).

17. Preposition *pre* or *pe* (Lat. *per*) is used before names of persons and before pronouns in the accusative. Compare the use of *a* (Lat. *ad*) in Portuguese, Spanish, dialects of Southern Italy and Engadine, e.g., *Am văcut pe prințul* (I have seen the prince); *Iacă un moșneag pe care ți-l recomand* (There is an old man I recommend you).

LITERATURE

Various Influences.—The intellectual development of Rumania has never until modern times been affected by Latin culture, but it has been most profoundly influenced successively by Slavonic, Greek and Byzantine, and Western, notably French and Italian, literature. Rumanian literary history may be divided into three periods: the Slavonic, from the beginnings in the middle of the 16th century down to 1710; the Greek, from 1710 to 1830; and the modern, from 1830 to the present. The change from Slavonic to Rumanian was very gradual. Slavonic had been the language of the church from the early middle ages, and was therefore hallowed in the eyes of the people and the clergy. Through the political connection with Bulgaria and Serbia it had also been the language of the chancelleries and the court. The beginnings of Rumanian literature proper consist of translations, as literal as possible, from Slavonic, prompted by the activities and aspirations of the Calvinistic reformers in Transylvania.

The second period is marked by a complete waning of Slavonic influence, through the literary activity of the Phanariote rulers. The Slavonic kingdoms to the south had ceased to exist, politically and culturally, whilst the Greeks brought with them the old literature from Byzantium and drove out the last remnants of Slavonic. They treated Rumanian as an uncouth and barbarian language, and imposed their own Greek upon the church. This Greek period corresponds to that of the Renaissance in the West; but when the rule of the Phanariotes was shaken off, the cultural link was broken too, and under Western influences began the romantic movement which has dominated Rumanian literature since 1830. Much of the Rumanian literature of the first two periods has been preserved only in mss; few of these have been investigated, and a still smaller number have been compared with their original.

First Period: c. 1550-1710.—Rumanian literature begins, like all modern European literature, with translations from the Bible. The oldest of these are direct translations from Slavonic texts, following the original word for word, even in its grammatical construction. The first impetus towards the printing of the Rumanian translations came from the princes and judges in Transylvania. It was under their orders and often at their expense that the first Slavonic printing-presses were established in places like Kronstadt (Brasov) Orăștia, Sasz-Shebesh and Alba Julia, where Slavonic and Rumanian books appeared. The foremost printer and translator was a certain Diakonou Koreși, of Greek origin, who had emigrated to Walachia and thence to Transylvania. He

was assisted in his work by the "popes" (parish priests) of those places where he worked. The very first book published in Rumanian is the Gospels printed in Kronstadt between 1560 and 1561. An absolutely identical Slavonic text of the Gospels appeared in the same year, or one year earlier, which no doubt was the original for the Rumanian translation. Following up the list of publications of the books of the Bible in chronological order, we find Diakonus Korei immediately afterwards printing a Rumanian translation of the Acts of the Apostles; in 1577 he printed at Sasz-Shebes a Psalter in both Slavonic and Rumanian; the Rumanian follows the Slavonic verse for verse.

The first complete Rumanian translation of the New Testament appeared at Alba Julia, in Transylvania, in 1648. Its chief author was a certain Hieromonach Sylvestre, a Walachian who had undertaken the work at the command of Prince Gabriel Bethlen of Transylvania and while it was based on the Slavonic version, it was collated with the Hungarian Calvinistic translation and the Greek original. The first edition of the complete Bible was published (1688) by order of Prince Ioan Sherban Cantacuzino, by Radu Greceanu, assisted by his brother Serban and by Bishop Metrofan of Buzeu. This may be considered as the supreme literary monument in Walachia in the 17th century. At least 100 years had to pass before a new edition of the whole Bible was undertaken. The first rhymed Psalter in Rumanian was published by Dositeiu in 1753.

The ancient collections of homilies in Rumania are due to the same proselytizing movement. Almost the first book printed by Korei (at the expense of the magistrate of Kronstadt, Foro Miklaus, c. 1570), seems to have been a translation from some Calvinistic compilation of homilies, one for every Sunday in the year. A Slavonic original sent by the metropolitan Serafim of Walachia served as the basis for a second collection of homilies known as *Evangelii invaditorea* (c. 1580). The first collection of homilies, known as *Casatii*, appeared in Dilogopole, i.e., Câmpulung, in Walachia, in 1642. It was compiled by a certain Melchisedec and contained 13 homilies.

The Rumanian language was not yet introduced into the church. The burial service seems to have been the first to be translated from the Slavonic. Two *Euhologia* appeared during the second half of the 17th century, one by the bishop Dositeiu (Jassy, 1679-80) and the other by Ioan of Vinti (Belgrad, 1689). This *Molitvie* (prayer-book) has been the basis of all subsequent editions of the Rumanian prayer-book. The liturgy proper was also translated by Bishop Dositeiu in 1679, but a translation from the Greek, by Jeremia Kakaveia (Jassy, 1697), was the one adopted in the churches. In 1694 Alexander Dascalul translated, and the bishops Mirotan of Buzeu and Kesarie of Râmnicu Vâlcea printed (among other church books) the 12 volumes of the *Mineu* in Slavonic with Rumanian rubrics, and short lives of the saints, as well as the *Triod* and the *Anthologion*.

In addition to the activity of the Reformers in Transylvania, there was also a Roman Catholic propaganda in Rumania; the Orthodox Church found it necessary to convocate a synod in Jassy in 1642 under the presidency of Peter of Mogila, and a formulary of the Orthodox creed was drawn up. An answer to the Lutheran Catechism of Heidelberg (translated into Rumanian and printed at Fogaras in 1648) was also prepared by Bishop Varlaam. R. Greceanu translated the formulary from Greek into Rumanian under the title *Pravoslavniciu marturisire* (Bucharest, 1692). Of a more decided polemical character is the *Lumina* of Maxim of Peloponnesus, translated from the Greek (Bucharest, 1699).

Of far greater interest is the literature of maxims, and lives of saints, real or apocryphal, intended to teach by example. Such are the maxims in the *Floarea darurilor*, translated from the Greek (Snegov, 1700), and going back to the Italian *Fiore de virtù*; the *Mântuirea păcătoșilor*, or "Salvation of sinners," translated from the Greek by a certain Cozma in 1682, which is a storehouse of mediaeval exempla; and above all the *Mirror of Kings*, ascribed to Prince Neagoe Bassaraba, written originally in Slavonic or Greek, if the prince be really the author), and translated c. 1650.

The first law-books were also compiled during this period. The Slavonic *Nomokanon*, which rests on Greek legislation and em-

bodies the canonical and civil law, had previously been used in Rumania. In 1640 there appeared in Govora the first canonical law-book, which was at the same time the first Rumanian book printed in Walachia. This *Pravilă* (code) was probably the work of the historian Moxa or Moxale. In 1646 appeared the *Pravilă aleasă*, or "Selected Code," compiled by Evstrateie the logothete and published with the authority of the then reigning Prince Vasile Lupul (Basil the Wolf), here known as the Code of Vasile. In 1652 there appeared in Bucharest a complete code of laws, adapted from the Greek and Slavonic under the direction of the prince of Walachia, Matthias Bassaraba. The *Indreptarea legii*, in which *Pravilă* of Vasile was incorporated without acknowledgment, remained the recognized code almost down to 1866. It embraces the canonical as well as the civil law. The chief authors were Uiril Năsturel and Danil M. Panoneanu.

The earliest historical works are short annals, written originally in Slavonic by monks in the monasteries of Moldavia and Walachia. In 1620 Moxa translated from the Slavonic a short history of the world down to 1498. Two other universal histories were translated from Greek and Slavonic chronographs. One by Pavel Danovici contains the history of the world told in the style of the Byzantine chroniclers; it includes the legend of Troy, the history of Pope Sylvester and the description of the various church councils; and it concludes at the year 1636. The second is the *Hronograf* of Dorotheus of Monembasia, translated by a certain Ion Bubușanu. Both are still in ms. The Old Slavonic annals were later on translated and new notes were added, each subsequent writer annexing the work of his predecessor, and prefixing his name to the entire compilation. The most important author whose writings rank as classical is Miron Costin, who either took up the thread where it was left by Simion and Ureche and wrote the history of Moldavia from 1594-1662, or continued the history from where (probably) Evstrateie had left it (c. 1630-62). Nicolae Costin (d. 1715), son of Miron, completed the history at both ends. He starts from the creation and endeavours to fill up the lacuna from 1662 to his own time, 1714.

In Walachia the beginnings are the work of an anonymous author, whose chronicle, continued by a certain Constantin Capitanul, describes the history of Walachia from Radu Negru (i.e., Rudolph the Black), c. 1290-1688. An addition to this chronicle from the time of the Roman Conquest to Attila is ascribed to Tudosie Vestemianul, twice metropolitan of Walachia (1669-73, 1677-1703). The chronicle of Capitanul was further continued by Radu Greceanu to 1707, and finally by Radu Popescu to 1720. A comprehensive history of both principalities was written by an anonymous author, probably the Spatar Milescu, who finished his eventful life as ambassador of Russia to China (still in ms.), and the *Hronical Moldo-Vlahilor* of Prince Demetru Cantemir (see CANTEMIR) is more an apology for the Roman origin of the Rumanians than a true history. Cantemir wrote the original in Latin and translated it into Rumanian in 1710. His style shows an immense superiority to that of the previous historians. Of poetry there is scarcely a trace except some rhymed Psalters and a few rhymed dedications to patrons.

Second Period: 1710-1830.—The Phanariote period has been described as one of total decay; political degradation was thought to be reflected in spiritual life. The facts do not warrant this opinion. The few students of Rumanian literature disregarded the vast ms. material accumulated during the Phanariote régime, and out of ignorance and political bias condemned the whole period as sterile. Another influence was far more potent than the conduct of the Greek princes, though some of the latter were benefactors of the people. In Transylvania one section of the Rumanian population had accepted the spiritual rule of the pope; they now became Greek Catholic, instead of Greek Orthodox. Rome strove to educate the priesthood above Orthodox standards, and developed a vigorous proselytizing activity. The substitution of the Latin alphabet for the Cyrillic, and the movement emphasizing the Roman origin of the Rumanian people, were among the means employed by the Roman Church to win over the Rumanians of Transylvania from the fold of Orthodoxy. Thus a great change was wrought towards the end of the 18th century and

in the first half of the 19th century in the whole spiritual life of the Rumanian race. It suited the promoters of the Latin movement to pretend that they started a new era. But this movement imposed a handicap upon Rumanian literature from which authors have begun to free themselves only recently.

By the end of the 17th century Rumanian had become the authorized language of the church, and the Rumanian translation of the Gospel, printed in 1693, had become the authorized version. Most of the liturgical books adopted in this period are still used. Such are the *Ceaslov*, revised by Bishop Klement of Râmnicu Vâlcea (1745), the *Euhologion* (1764), the *Katavasia* (1753). The 12 folio volumes of the Mineiu, by Bishops Kesarie and Filaret of Râmnicu Vâlcea (1776-80), and the monumental Lives of the Saints, also in 12 folio volumes, translated from the Russian and published (1809-12) under the auspices of the Metropolitan Veniamin of Moldavia, compare in beauty, richness and lucidity of language with the Bible of 1688. The most important works of the Fathers were also translated from the original Greek into Rumanian in this period.

In Transylvania, with the conversion to Greek-Catholicism of Bishop Athanasius in 1701, the Greek Orthodox had to place themselves down to 1850 under the protection of the Serbian metropolitan of Karlovatz. No writer of any consequence arose among them. The "United" fared better, and many a gifted young Rumanian was sent to Rome and helped from Vienna to obtain a serious education and occasionally also temporal promotion. With a view probably to counteract the literary activity in Rumania, the bishops P. P. Aaron and Ioan Bobb were indefatigable in the translation of Latin writers. First and foremost a new translation of the whole Bible was undertaken by Samuel Klain. It appeared at Blazh (1793-95). It falls short of the older version of 1688; it was modernized in its language, and no doubt a careful examination would reveal differences in the translation of those passages in which the Catholic tradition differs from the Eastern. Bobb translated Thomas à Kempis's *Imitatio Christi* (Blazh, 1812) and wrote a *Theologia moralis* (1801).

After 1777 Rumanian was recognized as the language of the law-courts, and through the annexation of Bukovina by Austria (1774) and of Bessarabia by Russia (1812), codes for the civil and political administration of those provinces were drawn up in Rumanian. Such legal codes reflect the German or Russian original. They were, however, of importance as they served as models (to some extent) for the new legislative code compiled in Moldavia under Prince Calimach; this was originally published in Greek (1816), and afterwards translated into Rumanian with the assistance of G. Asaki (Jassy, 1833). The Walachian civil laws and local usages were collected and arranged under the direction of Prince Ypsilanti (1780) in Greek and Rumanian; and under Prince Caragea another code was published (1817), which remained in force until 1832.

The last and probably the best writer of Rumanian history in the Phanariote period is Neculcea. He wrote a history of Moldavia to his own time, but for the period before 1684 his work is more or less an abstract from older writers. The original part covers the period 1684-1743, and is to some extent an autobiography of a very adventurous life. Neculcea adds to his chronicle a collection of historical legends, many of them still found in the ballads of Moldavia. In Walachia there was not a single historian of importance in the first half of the 18th century. In the second we have the chronicle of Dionisie Eclesiarh (1764-1815), a simple-minded and uncritical writer who describes contemporary events. The ancestor of a great family of poets and writers, I. Vacarescu described the history of the Ottoman empire from the beginning to 1791, interpolating doggerel verses.

Whilst a political and national revival was taking place in Moldavia and Walachia, towards the beginning of the 19th century, the Latin movement went on in Transylvania. There ethical and religious tendencies got the upper hand. Three historians had been partly educated in Rome under the protection of Prince Borgia and the influence of the Jesuit Minotto and the College of the Propaganda; they were Samuel Klain, Petru Maior and George Sincal. To Klain's initiative can be traced most of the

work of the three. Unfortunately his writings, with a few exceptions, are still in ms. He is the author of the first history of the Rumanians in Dacia written according to Western standards. The tendency is to trace the modern Rumanians directly from the ancient Romans, and to prove their continuity in these countries from the time of Trajan to this day. Political and religious aims were combined in this new theory. A conflict was raging between the Hungarians and Rumanians, and history was required to furnish proofs of the greater antiquity of the Rumanians in Transylvania.

Imaginative Literature.—These books had no immediate influence in Walachia and Moldavia, where fiction and the drama had developed under the influence, first, of Greek and then to an increasing extent of French, Italian and German models. It was towards the end of the 18th century that Rumanian literature began to emancipate itself, very slowly of course, and to start on a career of its own in poetry and *belles lettres*. Curiously enough, the first novel to be translated was the "Ethiopic History" of Bishop Heliodorus. The *Odyssey* and *Iliad* were then translated into prose, and the *Arabian Nights*, after undergoing an extraordinary change in Italian and modern Greek, appear in Rumanian literature at the middle of the 18th century under the name of *Halima*. The young men of Walachia had come into contact with Western literature. Most of the writings of Florian, Marmontel, Le Sage, Montesquieu and others were rapidly translated into Rumanian.

Nowhere has the theatre played a more important rôle in the history of civilization than in Walachia and Moldavia. It formed the rallying-ground for the new generation which chafed under the tyranny of a Greek court. A certain Aristia, of Greek origin, but soon acclimatized to his surroundings as teacher at the high school in Bucharest, was the first to adapt foreign dramas for the Rumanian stage. These were first performed in Greek and afterwards translated into Rumanian. The plays produced on the Rumanian stage included most of the dramas of Molière, some of Corneille, Kotzebue and Metastasio, whose *Achille in Sciro* was the first drama translated into Rumanian (by Iordache Slatineanu, printed at Sibiu in 1797). Schiller was also translated, and a few plays of Shakespeare (*Hamlet*, etc.) from a French version.

The lyrical and epic poetry of the time follows somewhat the same lines, but with certain notable differences. Transylvania, which awoke to a new life towards the end of the 18th century, produced some of the most popular poets. Among them were Vasile Aaron (1770-1822) and Ion Barak (1779-1848). Aaron wrote the *Passion*, in 10,000 verses (1802; often reprinted); the lyrical romances of *Piram și Tisbe* (1808) and *Sofronim și Hârîti* (1821); and the humorous *Leonat și Dorofata*, a satire on bad women and on drunken husbands, now a chapbook. Barak wrote *Răsîpirea Ierusalimului* (1821), "The Destruction of Jerusalem," almost as long as Aaron's *Passion*; and he versified a Magyar folk-tale, *Argîhir și Elena*, which has also become a chapbook, and has been interpreted as a political poem with a hidden meaning. He also translated the *Arabian Nights* from the German. In Walachia a certain Ion Budai Deleanu, a man of great learning, author of a hitherto unpublished Rumanian dictionary of great value, wrote *Tiganiafa* (1812) a satirical epos in which gipsies play the chief part.

The love-songs of the time are primitive imitations of the Neo-Greek lyric dithyrambs and rhapsodies, which through the teaching of the princes of Walachia were considered the fountain head of poetical inspiration. But a closer acquaintance with the West led to greater independence in poetical composition. In the three generations of the Vacarescu one can follow this process of rapid evolution. Ianache Vacarescu, author of the first native Rumanian grammar on independent lines, was also the first who tried his hand at poetry, following Greek examples. He then studied Italian, French and German poetry, and made translations from Voltaire and Goethe. His son Alecu followed his example. Both were overshadowed by the grandson Ioan (1786-1863). The collected poems of I. Vacarescu were published in 1848; but among them were some of the poems of Ianache and Alecu, which were confused with his own work.

In Moldavia a similar development took place, translations leading up to independent production. The most prominent figure is that of the scholar and linguist Constantin Konaki (1777-1849).

Third Period: from 1830.—The agitation for the transliteration of the alphabet, the elimination of all non-Latin words, and the ostracism of the old literature, completely crippled all literary activity, first in Transylvania and then in Rumania. The Latin movement was first brought into Walachia by the Transylvanian George Lazar who became a teacher at St. Sava's school in Bucharest and spread the doctrines of the Latin movement. Of his pupils there was one whose influence became decisive. Ion Eliade (Heliade), afterwards also known as I. E. Radulescu (1802-72), a man of immense activity, great initiative and still greater imagination. He it was who ushered in the new epoch, and for almost 40 years presided at almost every literary undertaking. There are two periods in his life, the latter the exact opposite and negation of the former. Up to 1848 he was closely connected with politics, the theatre and education. He founded the first political and literary review, and had a genius for discovering talent. About this time he turned to philology and fell under the spell of the Transylvanian school, the views of which he embraced with an ever-growing and toward the end fanatical zeal. He translated dramas and novels from French and Italian, and the number of his publications is legion.

All the prominent Rumanians of this period were politicians, striving to emancipate the country from the Turkish yoke, and later to effect the union of Moldavia and Walachia. These political aspirations form the keynote of the poetry and historical novels of Bolintineanu (1826-73). He was discovered by Radulescu, spent nine years in exile, returned in 1857 to Walachia and rose to high administrative posts. His main strength lay in his historical ballads, a *genre* which he introduced. Grigorie Alexandrescu (1811-85), another pupil of Eliade, is noted chiefly for his satirical rhymed fables. In Teodor Serbanescu (1837-1907) we find the reflex of Bolintineanu of the earlier period, in the beauty and simplicity of his lyrics.

Like Serbanescu, Vasile Alecsandri (1812-90) (*q.v.*) was a Moldavian. In 1855 he published, under the influence of Percy's *Reliques*, his collection of folk poems, *Ballades et chants populaires de la Roumanie*. This, together with the old chronicles, edited by Mihail Kogălniceanu (1845), constituted a living monument to the vernacular. Their importance as an inspiration and stimulus to the new writers was fully appreciated by Titu Maiorescu, who became the leading critical spirit in Rumanian letters.

Under Maiorescu's influence a group of national writers gathered round the newly founded periodical *Convorbiri Literare*. Among them were I. Creangă, who in his "Recollections of Childhood" and other tales embodied the spirit of the Moldavian peasantry; I. L. Caragiale, who, beside a realistic drama and two volumes of excellent short stories, showed in his comedies *Scrisoarea din Urmă* (The Lost Letter) and *Noaptea Furtunoasă* (Stormy Night) the grotesque effects of a hasty introduction of Western manners into a semi-oriental society; and above all the poet Mihail Eminescu (*q.v.*). He has been called the Rumanian Leopard, on account of his all-pervading sadness. But there is another side to Eminescu—his broad conception of the Rumanian race. It was this that impressed writers of the later generations such as Prof. Torga, who in his *Istoria Literaturii Române în secolul al XVIII. lea, 1688-1821*, etc. (1901) arrived at a clearer understanding of what a national literature may be. His own periodical *Sămănătorul*, and the reviews *Convorbiri Literare*, edited by Prof. Mehedinți, *Luccefulul* and *Viața Românească*, are the chief exponents of modern Rumanian letters.

Among Eminescu's followers the most important was A. Vlahuța (1858-1919). G. Coșbuc is the poet of the Rumanian peasant. He is a Transylvanian, and so was Octavian Goga (1881-1938), another poet of rich gifts, who however in latter years turned to politics and was one of the best leader writers.

Rumanian prose suffered in consequence of the philological confusion brought about by Eliade and his assistants, mostly Transylvanians who came to Rumania proper after 1848. N.

Bălcescu edited the ancient Walachian chronicles and wrote an admirable history of the reign of Michael the Brave. His friend and literary executor A. Odobescu was a consummate scholar of ancient and mediaeval antiquities, an unsurpassed satirist, and creator of the Rumanian historical novel (*Mihnea Voda*, 1858, and *Doamna Kiazna*, 1860). The first Rumanian novel to describe contemporary manners is the *Ciocoi vechi și noi* (1863) of Nicolae Filimon (1819-65).

Ioan Ghica, a contemporary of the revolutionaries of 1848, gathered his recollections into two volumes, *Amintiri* (1890) and *Scrisori către V. Alecsandri* (1887), which beside their historical value have become a model of Rumanian prose. Among writers of fiction mention is also due to Ion Slavici (1848-1925), whose short stories describe the life of Transylvanian peasantry; Barbu Ștefănescu de la Vancea (1858-1918), whose stories are characterized by wealth of imagery and richness of language; Ion Popovici-Băntăseanu, and Marcu Beza, whose volume of short stories *Pe Drumuri* (1914) and novel *O Viață* (1921) represent the life of the romantic Vlach population scattered throughout the mountains of Macedonia, Epirus and Thessaly. I. Al. Bratescu-Voinesti's two volumes of short stories, *În Lumea Dreptății* (In the World of Justice, 1908) and *În Tăcerie și Lumină* (Darkness and Light) were awarded, 1925, the great prize of the Rumanian Academy. Duiliu Zamfirescu's trilogy *Din Viața Comăneștilor* is a kind of Rumanian Forsythe Saga, while Liviu Rebreanu's novel *Ion* (1921) deals with the peasant's love of the land. Michael Sadonueva is a prolific writer of vivid and graphic short stories depicting the life of the Rumanian country-side.

Most popular among Rumanian dramatists is Ioan Caragiale (1852-1912) who brought on the stage living types of the lower and middle classes, and skilfully portrayed the effect of modern veneer on old customs. Barbu de la Vancea's trilogy, *Apus de Soare, Luceafărul, Vîjorul* (Sunset, The Evening Star, The Storm), is inspired by Rumanian history and folklore; Victor Eftimiu's fairy play *Insură-te, mărgărite!* (String, Ye Pearls!) is founded on a folk tale; so is Adrian Maniu's rhymed drama *Mășterul* (The Master Builder, 1922).

Among the critics and essayists Dobrogeanu Gherea (1855-1920) stands out with his *studii critice* (1890 *seq.*). In the domain of prose writing Rumania, like all the other nations of southeastern Europe, lags behind.

The World War does not seem to have either altered or much inspired literary production. An attempt to depict the general spirit during the German invasion of Rumania was made in a novel, called after the national colours, *Roșu, Galben și Albastru* (1925) ("Red, Yellow and Blue") by I. Minulescu, known as a disciple of the French symbolists. From the same school proceeded likewise a younger poet, Ion Pillat (1891-), who in his *Satul meu* (1925) ("My Village") manifests a definite return to the Rumanian tradition.

Popular Literature.—There existed in Rumania another set of literary monuments at least as old as any of the books hitherto enumerated, but which appealed to a wider circle. Rumanian folk-literature contains both popular written books and oral songs, ballads, etc. It is advisable to group the material in three sections: (1) the romantic and secular literature; (2) the religious literature;—both of these being written—and (3) the modern collections of ballads, songs, tales, etc.

To the first belong the oldest books, such as the *History of Alexander the Great*, which was known in Rumania in the 17th century. It rests mostly upon a Sloveno-Greek text and is of the utmost interest for the study of this cycle of legends. The first printed copy appeared in 1794, and it has been reprinted in innumerable editions. Next comes the legend of Constantine, of his town and his exploits—a remarkable collection of purely Byzantine legends. In addition to these there is the history of St. Sylvester and the conversion of Constantine, etc., all still in ms. The *History of Barlaam and Joasaj* (see BARLAAM AND JOSEPHAT) may also be mentioned here. The *History of Arkiv and Anadim*, printed by Anton Pann from older mss., is the now famous Old Testament apocryphon of Akyrios the Wise, mentioned in Tobit and found in many languages. In Rumanian it rests on an older

Greek-Slavonic text, and owes its great popularity to the wise and witty proverbs it contains. "Esop," whose wonderful biography (by Planudes) agrees in many points with Arkir, has also become one of the Rumanian popular books. The history of *Bertoldo*, which, though of Italian origin, reached Rumania through a Greek translation, belongs to the same cycle of rustic wisdom and cunning. These books are of course anonymous, most of them being translations and adaptations. One man, however, stands out prominently in this section of romantic and secular folk-literature. This was Anton Pann, who was born in 1797 at Slivden, of Bulgarian parentage, and died at Bucharest in 1854. Carried away by the Russians in his early youth, he settled in Rumania, and in about 20 years he published no fewer than 50 books, all of them still popular. Besides his edition of the Rumanian Church service-books with musical notation, he published a series of tales, proverbs and songs either from older texts or from oral information; and he made the first collection of popular songs, *Spitalul amurului*, "The Hospital of Love" (1850-53), with tunes either composed by himself or obtained from the gipsy musicians who alone performed them. Of his numerous writings two or three are of the greatest interest to folklore. His *Povestia vorbii* (first ed. 1 vol., 1847; 2nd ed. 3 vols., 1851-53) is a large collection of proverbs ingeniously connected with one another and leading up to or starting from a popular tale exemplifying the proverb. The *Fabule şi istorioare* (2 vols., 1859-61) is a collection of short popular stories in rhyme; *Seztoarea la tară* (1852-53) is a description of the Rumanian *Spinnstube*, for which the peasants gather in one of their houses on a winter's night, the girls and women spinning and working, the young men telling tales, proverbs, riddles, singing songs, etc.

Far larger than the secular is the religious popular literature; it comprises many apocryphal tales from the Old and the New Testaments, and not a few of the heretical tales circulated by the various sects of Asia Minor and Thracia, which percolated into Rumania through the medium of Slavonic. A brief enumeration of the chief tales must suffice. Only a few of them have hitherto been published. They exist in numerous mss. which testify to their great popularity; in the popular songs one finds many traces of their influence upon the people's imagination. They include the *History of Adam and Eve*, the *Legend of the Cross*, the *Apocalypse of Abraham*, the *History of the Sibyl*, the *Legends of Solomon*; numerous New Testament apocryphal tales, starting with legends of St. John the Baptist. A number of astrological calendars and *prognostica* are among the best known and most widely circulated popular books, and the lives of St. Alexius, Xenophon, etc., have become chapbooks.

The whole of this popular literature belongs to what may be called the cycle of the Balkan nations, in every one of which exact parallels are to be found. Not that there was any direct, deliberate borrowing by one nation from the other, but all of them seem to have been subject for a long time to identical psychological influences and to have developed on similar lines. One of the first to collect these treasures of Rumanian poetry was V. Alecsandri, who, however, retained only their poetical beauty and did not reproduce them with that strict accuracy which modern study of folklore demands. A. M. Marienescu collected those of Transylvania (1859); S. F. Marian, those of the Bukovina (1873); T. T. Burada, those of the Dobruja (1880); but the most complete collection is that of G. Dem. Teodorescu, *Poesii populare române* (Bucharest, 1885). The collection of fairy tales started later than that of the ballads. The first collection is the German translation of tales heard by the brothers Schott (1845). The most important collections, now deservedly considered as classical from every point of view, are the successive publications of P. Ispirescu.

It would be giving an incomplete picture of the contribution of Rumanian subjects to literature if one passed over the works of Rumanians which have appeared simultaneously in foreign countries and in Rumania: Charles Adolphe Cantacuzene (*Sourires Glacés*), the Princess Marthe Bibesco (*The Eight Paradises*, *Catherine-Paris*, *A Royal Victim*), Princess Elizabeth Bibesco (*I Have only Myself to Blame*).

Several of the stories cited above are contained in *Travels* by Princess Bibesco. (M. BE. A. BI.)

RUMELIA or **ROUMELIA**, a name used by the Turks to denote their possessions in the Balkans (Turkish *Rumeli*, the land of the Romans, i.e., Byzantines), particularly the ancient provinces, including Constantinople and Salonika, of Thrace and Macedonia; later particularized to denote the province composed of central Albania and western Macedonia. Eastern Rumelia (the present southern Bulgaria) became, by the Berlin Treaty of 1878, an autonomous province within the Turkish empire, but proclaimed its unity with Bulgaria on Sept. 18, 1885. (See *BULGARIA*).

RUMFORD, BENJAMIN THOMPSON, COUNT (1753-1814), British-American scientist, philanthropist and administrator, was born at Woburn (Mass.), on March 26, 1753. The Thompson family to which he belonged settled in New England about the middle of the previous century and were moderately wealthy farmers. At the age of 14 Benjamin was sufficiently advanced "in algebra, geometry, astronomy, and even the higher mathematics," to calculate a solar eclipse within four seconds of accuracy. In 1766 he was apprenticed to a storekeeper at Salem, in New England, and there occupied himself in chemical and mechanical experiments, and in engraving. At the outbreak of the American War when he was between 17 and 18 years of age he went to Boston, where he became assistant in another store. At 19 he married the widow of Col. Benjamin Rolfe, a woman possessed of considerable property, and his senior by 14 years.

This marriage was the foundation of his success. Soon after it he became acquainted with Governor Wentworth of New Hampshire, who conferred on him the majority of a local regiment of militia. As he was distrusted by friends of the American cause, it was considered prudent that he should seek an early opportunity to leave the country. On the evacuation of Boston by the royal troops, therefore, in 1776, Governor Wentworth sent him with despatches to England. On his arrival in London Lord George Germain, secretary of state, appointed him to a clerkship in his office. Within a few months he was advanced to the post of secretary of the province of Georgia, and in about four years under-secretary of state. He continued his scientific pursuits, however, and in 1779 was elected a fellow of the Royal Society. The explosive force of gunpowder, the construction of firearms, and a system of signalling at sea were subjects which particularly interested him. On the resignation of Lord North's administration, of which Lord George Germain was a member, he left the civil service, and was nominated to a cavalry command in the revolted provinces of America. But the War of Independence was practically at an end, and in 1783 he quitted active service, with the rank and half-pay of a lieutenant-colonel. He now decided to join the Austrian army, to campaign against the Turks. At Strassburg he was introduced to prince Maximilian, afterwards elector of Bavaria, and was by him invited to enter the civil and military service of that State. Having obtained leave of the British Government to accept the prince's offer, he received the honour of knighthood from George III., and remained at Munich 11 years as minister of war, minister of police, and grand chamberlain to the elector. During his stay in Bavaria he contributed a number of papers to the *Philosophical Transactions*. He re-organized the Bavarian army; he improved the condition of the industrial classes and he did much to suppress mendicancy. In one day he had 2,600 beggars and depredators in Munich and its suburbs alone arrested and transferred to an industrial establishment which he prepared for them. In this institution they were housed and fed, and they not only supported themselves, but earned a surplus for the electoral revenues. The principle on which he acted is stated by him in the following words: "To make vicious and abandoned people happy, it has generally been supposed necessary first to make them virtuous. But why not reverse this

order? Why not make them happy, and then virtuous?"

In 1791 he was created a count of the Holy Roman empire, and chose his title of Rumford from the name of the American township to which his wife's family belonged. In 1795 he visited England, where he lost all his private papers, including the materials for an autobiography. In London he applied himself to the discovery of methods for curing smoky chimneys and to improvements in fireplace construction. But he was quickly recalled to Bavaria, Munich being threatened at once by an Austrian and a French army. The elector fled, and it was entirely owing to Rumford that a hostile occupation of the city was prevented. It was now proposed that he should be Bavarian ambassador in London; but the fact that he was a British subject presented an insurmountable obstacle. He returned to England, however, as a private citizen. In 1798 he presented to the Royal society his "Enquiry concerning the Source of Heat which is excited by Friction," in which he combated the current view that heat was a material substance, and regarded it as a mode of motion. In 1799, he, with Sir Joseph Banks, projected the establishment of the Royal institution. It received its charter from George III in 1800, and Rumford selected Sir Humphry Davy as scientific lecturer there. He lived in London until 1804, when he went to Paris, marrying (his first wife having died in 1792) the wealthy widow of Lavoisier, the celebrated chemist. He separated from her eventually and took up his residence at Auteuil. He died there suddenly on Aug. 21, 1814, in the 62nd year of his age.

Rumford was the founder and the first recipient of the Rumford medal of the Royal society. He was also the founder of the Rumford medal of the American Academy of Arts and Sciences, and of the Rumford professorship in Harvard university. His complete works with a memoir by G. E. Ellis were published by the American Academy of Arts and Sciences in 1870-75.

RUMFORD, a town of Oxford Co., Maine, U.S., on the Androscoggin river, 60 mi. N. of Portland; served by the Maine Central railroad. The population in 1950 was 7,888. Rumford has a large hydroelectric station and large book paper mill, all under one roof. It was founded in 1893 as an industrial community, and is a ski centre.

RŪMĪ (1207-1273). Mammad b. Husain al-Balkhī, better known as Maulānā Jalāl-uddīn Rūmī (or simply Jalāl-uddīn), the greatest Sūfī poet of Persia, was born on Sept. 30, 1207 (564 A.H. 6th of Rabi' I) at Balkh, in Khorāsān. His father was invited to Iconium (or Rum), and from that place Jalāl-uddīn took his pen-name.

Jalāl-uddīn founded the order of the Maulawī (Mevlevī) dervishes, famous for their piety as well as for their garb of mourning, their music and their mystic dance (samā), which is the outward representation of the circling movement of the spheres, and the inward symbol of the circling movement of the soul caused by the vibrations of a Sūfī's fervent love to God. Most of Rūmī's matchless odes were composed in honour of the Maulawī dervishes, and even his *opus magnum*, the *Mathnawī* (*Mesnevī*), or, as it is usually called, *The Spiritual Mathnawī* (*mathnawī-i-ma'nawī*), in six books with 30,000 to 40,000 double-rhymed verses, can be traced to the same source. The idea of this immense collection of ethical and moral precepts was first suggested to the poet by his favourite disciple Hasan, better known as Husām-uddīn, who in 1258 became Jalāl-uddīn's chief assistant. Jalāl-uddīn dictated to him, with a short interruption, the whole work during the remaining years of his life. Soon after its completion Jalāl-uddīn died, on Dec. 17, 1273.

Jalāl-uddīn's life is fully described in Shams-uddīn Ahmed Aḥṣī's *Mandih-ul-ḡifw* (written between A.D. 1318 and 1353), the most important portions of which have been translated by J. W. Redhouse in the preface to his English metrical version of *The Mesnevī, Book the First* (London, 1881); there is also an abridged translation of the *Mathnawī*, with introduction on Suḥuf, by E. H. Whinfield (2nd ed., 1908). Complete editions have been printed in Bombay, Lucknow, Tabriz, Constantinople and in Bulak (with a Turkish translation, 1268 A.H.), at the end of which a seventh diḥṣ is added, the genuineness of which is refuted by a remark of Jalāl-uddīn himself in one of the Bodeian copies of the poem, Ouseley, 204 (f. 38a seq.). A revised edition was made by 'Abd-ul-hafīz between 1024 and 1032 A.H., and the same author's commentary on the *Mathnawī*, *Lalā'ī-ḡulmawān*, and his glossary *Lalā'ī-ḡulmawān*, have been lithographed in Cawnpore (1876) and Lucknow (1877) respec-

tively, the latter under the title *Farhang-i-mathnawī*. For the other numerous commentaries and for further biographical and literary particulars of Jalāl-uddīn, see Rieu's *Cat. of the Persian MSS. of the Brit. Mus.*, vol. II, p. 584 seq.; A. Sprenger's *Oudh Cat.*, p. 489; Sir Gore Ouseley, *Notes of Persian Poets*, p. 112 seq.; H. Ebdé, in *Morgenländische Studien* (Leipzig, 1870), p. 95 seq., and in Geiger and Kuhn's *Grundriss der iranischen Philologie* (Stuttgart, 1869-1904), vol. II, pp. 287-292. Selections from Jalāl-uddīn's diwan (often styled *Diwān-i-Shams-i-Tabriz*) are translated in German verse by V. von Rosenzweig (Vienna, 1836); into English by R. A. Nicholson (2nd ed., 1868) and W. Hastie (1903).

RUMINANTIA, a term employed by Cuvier to include all the artiodactyle ruminating ungulate mammals classed under the groups Pecora, Tylopoda and Tragulina. (See ARTIODACTYLA; PECORA; TYLOPODA.)

RUMMY, or **RUM**, **RHUM**, **ROMME**, a card game having a common origin with Coon-Can (*q.v.*). It was given its name "rum" (queer), or "rummy," in England, but attained its greatest popularity in the United States, where a survey made in 1941 showed it to be the most generally known card game.

The basic idea of rummy is the formation of structures. A standard pack of 52 playing cards, with or without one or more jokers, is used. The cards rank: king (high), queen, jack, ten, nine . . . ace (low). The player's object is to form matched sets: "groups" of three or four of a kind (as, three 9s, or four 6s); or sequences of three or more cards of consecutive rank in the same suit (as, ♠K-♠Q-♠J). When the joker is used its holder may cause it to represent any card he chooses.

Rummy has no official rules and has countless variants, but substantially the following procedure is common to them all:

Two or more play. The rotation of the deal and turn to play is clockwise, beginning with the player at the dealer's left. Each player receives seven cards (in a two-hand game, ten cards; in a five- or six-hand game only six or five cards), dealt one at a time face down. The next card is placed face up on the table to found a "talón" (waste pile) and the remaining undealt cards form a "stock" placed face down beside the talón. Each player in turn must draw the top card from either the talón or the stock, and add it to his hand; he may then "lay down" any matched set, or may "lay off" one or more matching cards on any matched set previously laid down by any player; and must then discard one card face up on the talón. A player may not lay down more than one matched set in a turn (unless, as in many variants, he can lay down his entire hand at one time, in which case he is said to be "rummy" and in most methods of settlement collects double).

The game is won by the first player who "goes out" (that is, who has laid down all his cards). He wins from each other player the total pip value of the cards remaining in that player's hand, face cards counting 10 each. In some variants the ace ranks high (as in the sequence A-K-Q) as well as low, and counts 11 points in the settlement; the joker, when used, counts 15.

A game may end when any player reaches an agreed score, as +100, or -100; or after an agreed number of deals.

The Block Game.—After the stock has been exhausted each player in turn may draw or not, as he pleases, from the talón. Then, if no one has gone out, the player with the lowest pip count wins, collecting from the others as though he had gone out. Players who tie for low divide the winnings. (As some play, the talón is shuffled, or simply turned over, and used again as the stock.)

Double Rum.—Two full packs plus one or two jokers, all mixed to form a 105- or 106-card pack, are used. Each player receives ten cards and play proceeds until someone goes out, the talón being turned as often as necessary. In laying off on a sequence containing a joker at either end, a player may change the designation of the joker provided it remains a card in sequence, thus, with joker: ♠6-♥7 showing, a player may add the ♥5, ♠4, ♥8 or ♥9; but with ♥6-joker-♥8 showing, he may not add the ♥7.

In forms of double rum called variously Progressive Rummy, Liverpool, Joker Rummy, Zioncheck and by other names, each game consists of a series of five or six deals. In each deal a specified combination is required to go out, as, two groups on the

first deal, one group and one sequence on the second, two sequences on the third, and so on.

500 Rum.—This is the most scientific rummy variant, and differs in principle from all others. Each player starts with ten cards and may in turn draw as many cards as he pleases from the talon, provided in the same turn he lays down some matched set including the bottom card drawn. Play ends when any player goes out, whereupon each player scores the pip count of all cards he has laid down (or laid off) minus the pip count of any cards remaining in his hand. The ace ranks high or low and counts 15; the joker, when used, counts 20. The first player to reach +500 wins the game. 500 Rum may be played with one or two packs. It is a good four-hand partnership game.

Continental Rummy.—Up to five players use two packs of cards; six to eight players, three packs; nine to twelve players, four packs; in each case with one joker per pack. Only sequences count, ace ranking high or low. Each player receives fifteen cards and must go out all at one time with (a) five three-card sequences; (b) three four-card and one three-card sequences; or (c) one five-, one four-, and two three-card sequences.

Knock Rummy.—Any player in turn may end the game by knocking (or, "going down"), whereupon the unmatched cards in every player's hand are counted and the player with the lowest pip count wins from each other player the difference between their totals. Thus, if one player knocks with a count of 9, another player holding K-K-K-6-5-5-4 would lose 11 points to him. In certain variants a player may not knock unless his own count is at most 7, or 10, or 15, depending on the custom of the game.

Gin Rummy.—An American variant originally called Gin Poker or simply Gin, was first played in 1907 and in 1941 became a fad as widely publicized as that of contract bridge (*q.v.*) in 1931-32. Two play, each receiving ten cards. A player may knock when the pip count of his unmatched cards, after he discards, will be 10 or less. He scores the difference between his pip count and that of his opponent (who may first lay down and lay off what he can). If the opponent has the same or a lower count he scores the difference, if any, plus 10 points. For "going gin" (knocking and laying down all ten cards in matched sets) a player scores the difference in counts, if any, plus 20 points. If only two cards remain in the stock and neither player has knocked, there is a redeal. The first player whose score reaches 100 points wins the game, and receives a 100-point bonus. Each player then adds to his score 20 points for every deal on which he was the winner. If the loser has not scored, the bonus for game is 200 points.

Partnership play is possible, with two or more players to a team, playing separate two-hand games and combining the scores of all partners to produce one winning team for each deal.

In Hollywood Gin, the two players score their results in three games at once: Each player's first winning score is credited to him in Game 1, his second winning score in Games 1 and 2, and subsequent winning scores in all three games.

See *Gin Rummy: The Official Rules*, 1943.

(A. H. M.)

RUNCORN, market town, urban district, river port, North-west parliamentary division, Cheshire, England, on the south of the estuary of the Mersey, 16 mi. above Liverpool. Pop. (1938) 23,340. Area, 4.5 sq.mi. It is on the L.M.S.R., and the Bridge-water canal (1773), which here descends into the Mersey by a flight of locks. Runcorn, being on the Manchester ship canal, is a suburb of Manchester, and has extensive wharfage and warehouse accommodation. The chief exports are coal, salt and pitch; but there is also a large traffic in potters' materials. It is connected with Widnes by a railway and a transporter bridge. The town possesses shipbuilding yards, iron foundries, rope works, tanneries, soap and alkali and chemical works. Runcorn was in early times of considerable importance. On a rock which formerly jutted into the Mersey Aethelfleda erected a castle in 916. The ferry is noticed in a charter in the 12th century.

RUNDALE, the name of a form of occupation of land, somewhat resembling the English "common field" system. The land is divided into discontinuous plots, and cultivated and occupied by a number of tenants to whom it is leased jointly. The system was common in Ireland, especially in the western counties. In

Scotland, where the system also existed, it was termed "run-rie."

RUNEBERG, JOHAN LUDVIG (1804-1877), national poet of Finland, son of a sea captain, was born at Jakobstad, on Feb. 5, 1804. He was educated at the University of Åbo and after its removal to Helsingfors, Runeberg became, in 1830, amanuensis to the council of the university. In 1831 his verse romance of Finnish life, *Grafven i Perhio* (The Grave in Perhio), received the small gold medal of the Swedish academy, and the poet married Fredrika Charlotta Tengström, daughter of the archbishop of Finland. In the same year he was appointed university lecturer on Roman literature. In 1837 Runeberg accepted the chair of Latin at Borgå college, of which he was rector in 1847-50, and lived at Borgå for the rest of his life.

His two idylls, *Elgskytarne* (The Elk-Hunters) and *Hanna* had won for him a place second only to Tegnér among the poets of Sweden. Later works are *Nadeschda* (1841); *Julqvällen* (1841); *Fänrik Stills Säger* (2 series, 1848 and 1860), patriotic poems on the war of independence of 1808; and *Kungarne på Salamis* (1863), a tragedy. In 1844 he published the noble cycle of unrhymed verse romances derived from old Scandinavian legend and entitled *King Fjalar*. Runeberg died at Borgå on May 6, 1877. His writings were collected by C. R. Nyblom in six volumes in 1870, and his posthumous writings in three volumes (1878-79). The poems of Runeberg show the influence of the Greeks and of Goethe upon his mind; but he possesses a great originality. It is hardly possible to overestimate the value of his patriotic poems as a link between the Swedish and Finnish nations. He has remained one of the most popular poets writing in Swedish, although his whole life was spent in Finland.

An account of his life and works by C. R. Nyblom is prefixed to the *Samlade Skrifter* of 1870. For a minute criticism of Runeberg's principal poems, with translations, see Gosse's *Studies in the Literature of Northern Europe* (1879). A selection of his lyrical pieces was published in an English translation by Messrs. Magnusson & Palmer in 1878. There are also monographs on Runeberg by Dietrichson and Rancken (Stockholm, 1864), by Cynäus (Helsingfors, 1873), by Ljunggren (Lund, 1882-83), Peschier (Stuttgart, 1881), and by W. Soderhjelm (Stockholm, 1904). A further edition of his *Samlade Skrifter* appeared in 1907.

RUNES, the oldest form of Germanic writing. This form of writing was in use in the Scandinavian North in the 3rd century, and in remote districts of Sweden almost down to our own times.

FIG. 1.—THE EARLIER RUNE-STAVES

During the first centuries of their vogue runes consisted of 24 letters: the so-called older or all-Germanic runic staves (*fig. 1*).

FIG. 2.—THE VÄSTENA BRÄKTEA

Their peculiar forms appear first in inscriptions found all over Europe from Rumania and western Russia to the east of France and Friesland, but in greatest number in England and Scandinavia. Runes, which at first sight seem to betray derivation from the southern European alphabets, the Greek and the Latin, differ from these radically in their arrangement, as we may see from some inscriptions which use the runic staves in their entirety, the most important being the Kylver Stone in Gothland (5th century), the Västena braktea from Östergötland, Sweden (*fig. 2*), the Charnay clasp from eastern France and the Thames sword from southern England. Moreover every rune had its special name which we know through the oral traditions recorded in Anglo-Saxon manuscripts. The 24 runes were divided up into three groups of eight each, each group coming later to be called in Scandinavian an *aett*, a word which probably meant "number of eight." The runic staves, at least at a later

period, were called *futhark*, after their initial letters.

As regards sound values, it may be mentioned that *th* was pronounced approximately as in the English *thing*; *d* like *th* in the English *this*; *g* had a sound corresponding to a fricative *d*; *b* in the same way, therefore corresponding to *b* in the Spanish *habana*; *ng* like *ng* in *England* and *R*, finally, almost like *s* in the English *is*.

The oldest extant decipherable runic writings as to the origin of which we can speak with any certainty hail from discoveries in the bogland in south-western Denmark, Vi-mose in Fyn, and Torsbjærg in Slesvig. Most archaeologists date the first-mentioned from the middle of the 3rd century, the second from the 4th. The inscriptions are few in number and brief. Those which can be deciphered contain one or two names of men. These earliest finds of runes in Denmark were supplemented by a whole series of others from the 4th, 5th and 6th centuries—inscriptions on single objects, arms, ornaments, and more especially gold *brakteas*. Archaeological research establishes the fact that south-western Denmark was really the cradle of the knowledge of runes, whence the use of runes spread to Norway and Sweden. It has been ascertained, moreover, that from Slesvig it made its way in the 5th century along the southern coast of the North Sea to England and the Continent.

If then Slesvig and Fyn are the original home of the runes in northern and western Europe, our next question is: did the runes originate in Denmark or were they imported from elsewhere? It has been established that a number of runes which are contemporaneous with the oldest of those found in the Danish bogland have been discovered along a line of country passing through Pomerania, Brandenburg, Volhynia and Rumania. Moreover these discoveries include archaic objects the primary forms of which do not hail from western Europe but are found in south-eastern Europe, on the northern coast of the Black Sea and along the lower Danube. From this fact the Swedish archaeologist, B. Sahn, drew the conclusion a quarter of a century ago that the runes came to Scandinavia from south-eastern Europe. The eastern European runes are certainly Gothic in part, and it is certain that runes were known and used among the Goths in the first half of the 4th century, because Ulfilas, the Apostle of the Goths, constructed his Gothic writing on the basis of runes. It may be added that in the 3rd and 4th centuries there is no trace of the existence of runes in the western Teutonic world, i.e., south-west of the line Slesvig, Berlin, Bukarest.

This signifies that the runes originated with the Goths in south-eastern Europe, in a milieu, therefore, in immediate touch with Greek and Latin culture. Greek was the prevailing language along the lower Danube; Latin was the language of the Roman forces and colonists. Archaeological and historical discoveries indicate, therefore, that the runes had their source in one or other of the classical alphabets—or in both.

It remains to consider what the runes themselves have to tell about their origin. The Dane, L. Wimmer, has made it clear paleographically that they are derived from classical writing. It has been demonstrated by him that the runes have the same signs for the vowels *a*, *e*, *o*, as the Greek and Latin alphabets, but these letters in the Latin are the result of a Greek modification of the Semitic guttural signs. Wimmer has demonstrated, too, once for all, that at least the runes for *f*, *h*, and *r*, derive from the Latin alphabet. As quite a number of runes like *a*, *i*, *h*, *t*, *m* and *n*, may be traced typographically to the Greek and Latin alphabets, and as it undoubtedly would be natural to seek the source of the runes in a single alphabet, Wimmer seeks to trace all the runes back to Latin. In so seeking, however, he has been forced into assumptions and deductions which must be regarded as improbable and irrational. In February 1928, the Norwegian, C. J. S. Marstrand, in a very weighty treatise, seeks to show that the runes derive from a late Northern Etruscan alphabet, most of the letters of which were made up out of the Latin but which in regard to sounds, not to be found in the Latin, preserved a number of Northern Etruscan letters. This alphabet was in use at the beginning of our era in the region of the eastern Alps among Celtic tribes and it was through intercourse with these that the Teutons, probably the Marcomanni who lived in Bohemia, created the

runes. Certain runes are more easily and naturally explained in the light of Marstrand's paper than in that of any other interpretation that has been put forward, but on the other hand new difficulties present themselves in regard to other runes. Archaeological and chronological facts seem also hard to reconcile with Marstrand's hypothesis. He has promised us a more exhaustive treatise on certain questions bearing upon the

FIG. 3.—CLASSICAL LETTERS AND RUNES

problem. Until this is available, or at all events until Marstrand's hypothesis can be examined thoroughly, the theory regarding the origin of the runes put forward in 1904 by von Friesen along the following lines may be accepted.

We have just noted that certain runes may safely be said to derive from Latin letters. On the other hand the runes possess certain characteristic features which are in agreement with the Greek alphabet. These are: (a) the phonetic signs in both alphabetical systems number 24, which in view of the use of the runes for magical purposes has acquired its special significance. The Latin alphabet consisted originally of 21 letters, afterwards, when *y* and *x* were adopted from the Greek, of 23; (b) the use in the runes of a special sign for *ng* points directly to the Greek indication of *ng* by *γγ*; (c) every rune has its special name, an arrangement which seems to be inspired by the peculiar Greek names inherited from the Semitic alphabet, *alpha*, *beta*, *gamma*, etc. The Latin letters, on the contrary, were called in classic times as they are now *a*, *b*, *c*, *d*, etc.

In addition we come upon a question of phonetic nature. Like the early Germanic, the Gothic language was specially notable for its wealth in spirant sounds such as *th* in the English *thing* and *this*, *ch* in the German *auch*, *g* in the German *tage*, *b* in the Spanish *habana*. Hardly any sounds of this kind are to be met with in the later Latin of Imperial Rome except *f* and *s*, while Greek at this period possessed in addition both *th* and *ch*.

A comparison between the runes and the ordinary cursive form of the Greek alphabet gives us a number of concordances which can scarcely be attributed to chance. The Greek cursive alphabet has two forms of *e* (fig. 3, 1 and 2), the runes also have two forms; a Greek form of *o* (fig. 3, 3), which accords with the runic *o*. In the Greek is found a consonant *i*-sound which is written as fig. 3, 4 or fig. 3, 5, which latter form accords with the runic *i*. Also in the formation of other consonants we find the runic letters in remarkable accord with the Greek: the runic *l* accords with the Greek, fig. 3, 6 (compare the Latin fig. 3, 7); the runic *g*, with the sound value *ch* and *g* (γ), accords with the Greek (fig. 3, 8); the runic (fig. 3, 9) *th* in the English *this* with the Greek (fig. 3, 10). In other cases we find in the runes forms which are identical with the Greek but with different sound values: the runic form for *th* in the English *thing* accords with the Greek, fig. 3, 11 (f); the runic form for *R* or *r* (in the English *is*) accords with the Greek (fig. 3, 12). Finally the runic form for *ng* clearly derives from the Greek (fig. 3, 13) except for the symmetrical stylization usual in the formation of the runes.

These numerous resemblances between the runes and the Greek letters can scarcely be the result of chance. The concordance between the runes and the Greek cursive writing is particularly striking and, significantly, the runes which have their source in the Latin also in many cases derive clearly from the cursive form: the runic *f* is stylized Latin cursive (fig. 3, 14), and the runic *r* is always open in its middle part like the Latin cursive (fig. 3, 15), while the Latin uncial and lapidary *r* (fig. 3, 16) is closed. The runic *u* also seems to come from the Latin cursive *o* (fig. 3, 17).

The close relationship between the runes and the classic cursive handwriting—the ordinary handwriting used in everyday life and also by less cultured people—indicates that the art of writing

did not come to the Goths by the way of scholarship. Some individual Goths—mercenaries, for instance—from the north-western coast of the Black Sea, in the course of visits to the Roman provinces, learnt Greek and Latin and the Greek and Latin forms of writing used in state edicts and in private life. They acquired in addition an imperfect acquaintance with the lapidary and uncial style which was the basis for the ordinary

FROM L. F. A. WINNER, "DIE RUNENSCHRIFT" (WEIDMANN)
FIG. 4.—THE KOVEL SPEAR-HEAD

cursive handwriting, wherefore some forms of the better style occasionally appear. Such a Goth or several such Goths working together, undertook to write out the Gothic language on the basis of the knowledge of Latin and Greek writing thus acquired. The result of these efforts is the runic stave.

Like the letters of the classic alphabet, runes soon came to be used for purposes of magic, a use which continued for a long time. But that the chief purpose of the runes was to give the spoken language a fixed form is demonstrated at an early date by the fact that Ulfilas built up his Gothic letters upon runes, which even before his time had solved the difficult problem of representing the Gothic phonetic system by the use of classic letters.

Removed from the sphere of classical culture, the runic writing soon came to be used chiefly for inscriptions: it was carved or cut on wood, metal or stone. In the process the individual letters began to undergo a certain kind of symmetrical stylization or conventionalization which gave them a substantially different appearance from that of their classic prototypes, and, probably, in connection with this the runes came to be put in an order entirely different from that of the classic alphabets.

From the region of the Black Sea the knowledge of runes soon spread to distant corners of the great dominion which the Goths established in the 3rd and 4th centuries between the Black Sea and the Baltic, and in the middle of the 3rd century we begin to find single objects with runic inscriptions on them in Gothland, Denmark and Norway.

Between the Black Sea and the Baltic we find at the same period runic letters in the Gothic language as on the spear-head from Kovel in Volhynia (fig. 4). On this may be read *tilarids*, which is either a man's name or, more likely, the name given to the costly spear-head inlaid with silver ornamentation. The word

FROM L. F. A. WINNER, "DIE RUNENSCHRIFT" (WEIDMANN)
FIG. 5.—THE THORSBJÆRG CHAPE

means "the one which reaches the goal," and it may have some magical significance.

Of the same period are certain Scandinavian discoveries of runes, among them the Thorsbjærg chape from Slesvig (fig. 5) which bears the inscription *owliuthewaR niwajmariR*; this is probably the names of two men, *Wulthu-thewaR* and *NiwajmariR*, both names being of the familiar old Germanic double-jointed type.

It has already been pointed out that Slesvig and Fyn constituted a cradle for the runes during the Roman iron age and the

earlier portion of the transmigration era (A.D. 250-450). There are many signs that runic writing was brought hither from the Black Sea by the Heruli, a people who play an important part in the history of the transmigration period and who seem to have had their origin in Denmark. Slesvig in those early days and until well into the middle ages was of primary importance for the intercommunication and exchange of merchandise between the Baltic regions on the one side and Western and Southern Europe on the other. In particular Slesvig had been long the traffic-route from the Rhineland and England up to the Scandinavian North. Regular communication by sea round Skagen and by the Skagarak and Kattegatt into the Baltic did not begin until the 13th century.

FROM S. MÜLLER, "NORDISCHE ALTERTUMSKUNDE" (WALTER DE GRUYTER & CO.)
FIG. 6.—THE GALLEHUS INSCRIPTION

A remarkable runic inscription found in Slesvig is that on a golden horn from Gallehus (fig. 6), which dates from the beginning of the 5th century. It reads: *ek hlewagastiR holtijaR horna tawido*—"I [the]lewagast from Holt made the horn." There are altogether about a dozen inscriptions on loose objects, also inscriptions of the older type as well as about 40 runic *brakteas* dating from between the 3rd and 6th centuries, which were found in Danish soil.

At a very early period—some time in the 3rd century—runic writing had spread from Denmark into Norway. Here as early

FROM L. F. A. WINNER, "DIE RUNENSCHRIFT" (WEIDMANN)
FIG. 7.—THE TUNE STONE, SOUTH-EASTERN NORWAY

as the 4th century the custom had begun of fitting stone monuments with runic inscriptions. One of the finest and longest inscriptions is that of the Tune stone from South-Eastern Norway (fig. 7). It would seem to date from the earlier half of the 5th century and reads: (*wiwa*)R (*?*) *woduride staina (saftio) thrijoR dohtriR da(i)tidum arbia si(Bi)josteR arbjano, ek wiwaR after woduride wita(n)-dahalabon worarito(runoR)*, which apparently may be translated: "Viv (?) raised this stone to Vodurid. Three daughters shared the inheritance as nearest of kin among his survivors. But I, Viv, engraved the runes to my master (=breadgiver, cf. the English *lord*) Vodurid."

In Norway the older runic staves had a relatively wide vogue: from the period A.D. 250 to A.D. 800 there are extant, in addition to *brakteas* with runic inscriptions, about 50 inscriptions, mostly on erected stones or stones inserted in tumuli but also on loose objects.

FIG. 8.—THE BJORKETORP INSCRIPTION

But the runes moved from south-western Denmark also up the Baltic. Here, as one might expect, the ancient centre for trade and intercourse in Northern Europe, the island of Gothland became also a region in which the older runic staves continued to be written throughout the entire period, though not to such an extent as in Norway. We find the runic inscriptions more sparsely on the mainland of Sweden—in Uppland, Södermanland and Östergötland. They are more frequent in Västergötland. In all about 20 runic inscriptions from the transmigration period have been found in Sweden, as well as a few runic *brakteas*. Of special note among them are the late (7th century) inscriptions from the most western parts of Blekinge which show a continuation of the

development of the runic letters which took place in south-western Norway, so rich in runes, during the early and middle periods of the transmigration era. Probably these inscriptions also came from Norwegian immigrants. The best preserved specimen is the Björketorp stone (fig. 8) which has its place in a fine stone setting and bears inscriptions on both its sides: *uitharAbasba=ruin-bringing prophecy*, and *haid runo runu JAlAHk hAd(e)rA ginarunAR ARAgcu hAerAmAlAusR uti AR welaAdAude sAR thAt bArutR* ("This is the secret meaning of the runes; I hid here power-runes, undisturbed by evil witchcraft. In exile shall he die by means of magic art who destroys this monument.") The inscription constitutes, therefore, a magical protection for the fine stone setting.

Of these Blekinge Stones the runic *k* has the form, fig. 3, 18, which about the year 500 was developed in Norway, while at the same time the form, fig. 3, 19, appears in Denmark, a form which proceeds thence to England.

For in the 5th century the runes went to the Germanic Continent and to England from South-Western Denmark. On the continent, where the runic *k* retains its original form, there have been found inscriptions from the Rhine Province, Hesse, Nassau, Thüringen, Württemberg, Bavaria, Austria, as well as in Charnay, the old Burgundian Kingdom in Eastern France, in what is now the *département* of Saône et Loire. These inscriptions are few and, like the Danish ones, all inscribed on loose objects, and they are not long. They are all held to belong to the period A.D. 450-550. As an illustration may be instanced the inscription on the clasp from Freilaubersheim in Rhénish Hesse (fig. 9): *boso wraet run-ath(ð)k dalina godda*, which means: "Boso wrote the runes—to thee, Dallina, he gave (the clasp)."

If this knowledge of runes constituted merely a brief episode on the western Germanic continent, it flourished for five centuries in England. The Anglo-Saxon rune staves like the continental-Germanic, have two cross-strokes in the letter *k*, differ from it in the form of the *k*, and from the Scandinavian and Eastern-Germanic, as well as from the Continental-Germanic runes with their 24 letters, in this, that new letters are created to render the most important novelties in the rich Anglo-Frisic vowel system. Later there were added also new consonant letters. The beginning of this development of the system of letters had been already effected on the southern portion of the coast of the North Sea in Friesland, where, in the Holland of to-day, may be seen inscriptions belonging to the end of the 5th century and to the 6th with new runic letters for *a-* and *o-* sounds. In England there developed a runic staff with 28 letters in it (fig. 10) and in the 9th century the number increased to 33.

In England there are extant about 50 runic inscriptions upon loose objects and upon raised stones (stone crosses). Among the most remarkable and also the best preserved are those which are carved on a casket made of whalebone, the so-called Frank's casket

FIG. 9.—THE FREILAUBERSHEIM BROOCH

Saxon runic stave (fig. 12), out of the Cod. Cotton. Otho B. 10. in the British Museum, a manuscript which gives the runic names of oldest date.

In England the runes persisted throughout the entire Anglo-Saxon period. The most remarkable monuments from later times are the two celebrated runic crosses from Bewcastle and Ruthwell on the Anglo-Scottish border.

FIG. 11.—FRANK'S CASKET

Thanks to the tradition kept alive in England from ancient times and also to the fact that the names borrowed by Ulfilas from the runes to render Gothic letters are to be seen in the manuscript (not, indeed, in an unchanged state) preserved in the National Museum at Vienna, we are able to reconstruct approximately the name which every runic letter seems to have borne from the commencement. Younger traditions handed down in Scandinavia are also of value although the later peculiarity

FIG. 12.—THE LATER ANGLO-SAXON RUNES

Northern runic staves contained only 16 letters and the names of 8 letters therefore have been lost. In the first column below are given the Anglo-Saxon names of runic letters, in the second the Scandinavian and in the third the Gothic names reconstructed:—

f	feh	money	fē, fa	goods	faihu (read fehu)
u	str	aucho	stir	aucho	uris

—	ing	a hero			olud
o	old	inheritance			olud
d	dag	day			dags

Thus the great modification of the Germanic sound-system caused by vowel-mutation, by breaking and by other changes in sound during the transmigration period resulted in a considerable enlargement of the runic alphabet in England. In Scandinavia, it is curious to note, the same linguistic development produced a directly opposite result: the number of the runes was reduced from 24 to 16. And this, although the Scandinavian stock of sounds reached 30 or 40 during the later transmigration period. The explanation of this would seem to lie in the fact that, while the original 24 runes covered adequately the old Germanic sounds, it became the habit later, as the result of the increase in the sound-system, to represent different sounds with the

FIG. 10.—THE EARLIER ANGLO-SAXON RUNES

(fig. 11). The inscriptions together with illustrations from Biblical history and from Roman and Germanic legends cover the sides of the casket and the lid and are held to be not later than about A.D. 650. The inscription on one side reads: *hromas ban fish flodu aþ on fergenberig worth gosik groms thar on great giswom*, which means: "The whalebone (is this). The flood threw the fish on the firm rock. The monster (?) was stranded on the stone in agony."

Here may also be reproduced the younger 33 lettered Anglo-

same runic letter. This brought about the simplifying of the alphabet: when a single runic letter could be used to render several sounds, many of the old letters became superfluous. Simultaneously the formation of many of the runes was simplified. This twofold reduction of numbers and forms began in Scandinavia as far back as the 6th century, and at the beginning of the Viking era this had resulted in a special 16 letter Scandinavian alphabet. This alphabet appears in two distinct forms, the one

FIG. 13.—THE DANISH RUNES

Danish (fig. 13), the other Swedish-Norwegian (fig. 14). The Danish was used also in South-western Sweden.

In Denmark runes seem to have been very little used after the close of the 6th century, and the form of the runic *k*, as well as other details, indicates that it was through an impulse from Norway or Sweden that runes came into use again in Denmark at the close of the 8th century. About 200 inscriptions upon raised stones are extant, as well as a few upon loose objects. Most of these inscriptions date from between A.D. 800 and the middle of the 11th century. Despite their laconic and often stereotyped wording, they are among the most remarkable, both as regards style and matter, that have been found in Scandinavia. They give us the names of several hundred men and women who lived in Denmark during this important period, from members of the Royal house down to the lower grades of society, and they provide us with data for visualizing the life of the people and of individuals in war and peace.

The runic monuments which date from the beginning of this period are few in number. One of the oldest and most remarkable inscriptions with runes of the later period is the Helnes stone at Fyn (fig. 15): *rhuulR sati stain nuRa kuthi aft kuthumut bruthur sinu sin turuknathu (hailR uti) ouatR fathi*. If it were written in a more adequate phonetic alphabet, e.g., *ð* the Early Norwegian Icelandic alphabet which includes *ð*, this inscription would have run: "*HrólfR setti stein, NóRa goði, aft Guðmund broð urusinu sinn drunknaðu hailR uti. Áveir fæði*; which means: "Rolf raised this stone, priest and chieftain of the Helnes dwellers, in memory of his brother's son, Guðmund. The men were drowned at sea. Áveir wrote (the runes)."

From the earlier half of the 10th century we have the smaller of the two famous Royal Stones of Jällinge in Jutland (fig. 16): *kurmR kumu(n)kR karthi ku(m)bi thusi aft thurud kumu sina tanmarkaR but*; which means: "King Gorm made this monument

FIG. 14.—THE SWEDISH-NORWEGIAN RUNES

in memory of his wife, Týra: he (Gorm) who improved Denmark."

The great majority of Denmark's 200 runic stones date, however, from the end of the 10th and the beginning of the 11th centuries. It was the period when the Vikings' raids on England were renewed, resulting at last in the conquest of the country by the Danish King Sven Trybward, who is mentioned in two of the runic inscriptions, and Canute the Great. The relations between Denmark and England are reflected in the history of the

runic inscriptions inasmuch as it was probably due to influence by the Anglo-Saxon runes that the Danish alphabet now began to be enlarged by so-called pointed runes, see page 664.

From Denmark the Danish runes spread about A.D. 1000 to Sweden where runic inscriptions on raised stones became more numerous than anywhere else in the world. There are known in Sweden about 2,400 runic inscriptions, chiefly from the 11th century and the beginning of the 12th, the majority of them written in Danish runes. No fewer than half of them belong to the central region of the kingdom, Uppland. These monuments enable us to follow the upward course of the Danish runes through Sweden from Shåne and Väster-götland to the southern part of Norrland, and it can be noted that the inscriptions in the south are, on an average, of earlier date than those in the north. The custom of erecting runic stones was not long-lived anywhere. Generally speaking, it was abandoned whenever a region became definitely Christianized and controlled by the Catholic Church, but it seems to have had a vigorous final revival during the missionary period. The course of the spread of Christianity throughout Sweden during the 11th century—beginning in the south and proceeding to the north—is therefore traceable in a special way in the appearance of the

FIG. 15.—THE HELNES STONE

runic stones. From the beginning runic stones were erected for the most part in the graveyard of the villages, and one principal reason for giving up the custom of erecting them must have been that with the spread of Christianity the dead had to be buried in the cemetery adjoining the parish church, often at a distance from the home. Thereby monuments lost much of their interest for the survivors. In Uppland, more especially, the runic inscriptions were accompanied by cleverly executed ornamental design, the patterns of which were taken from wood-cuts—the art of wood-cuts having been highly developed during the transmigration and Viking periods. Not merely the runes themselves but also these ornamental designs needed craftsmanship, therefore, and we find that many runic inscriptions are executed by expert craftsmen.

The oldest and most remarkable (about A.D. 1025-1050) of these Uppland professional writers of runes was Asmund. He is probably identical with Osmundus, who is mentioned by the Bremen ecclesiastical historian, Adam. Osmundus was one of the Englishmen of Scandinavian origin who prepared the way in Sweden for the conquest of Christianity. Other talented masters of the art were Fot and Ópir. Asmund's stones record the names of a number of Swedes who took part in Canute the Great's conquest of England. On the Ångeby Stone (fig. 17), one of Asmund's inscriptions reads as follows: *rahnfrithr lit risa stain thina aftR biurn sun thairR kiilmuntaR. kuth hialbi hans aut aukuths muthiR, hon fil a vartanti. in osmunt markathi*. This means: "Ragnfrid had this stone erected in memory of Björn, her and Kättilmund's son. God and God's Mother help his soul! He fell in Estland. But Asmund engraved (the Stone)."

When the reduction of the runic alphabet from 24 letters to

FIG. 16.—THE EARLIER JÄLLINGE STONE

16 came about, the simplifying of the individual letters was carried furthest in the Swedish-Norwegian runes. These are to be found in Gotland, in eastern Götaland, in Svealand, and in Norway, dating from the beginning of the Viking era, about A.D. 800. As we have just seen, they are displaced on monuments by the Danish runes in the beginning of the 11th century in Sweden, but many circumstances indicate that even after this period they are used for more private purposes. Comparatively few runic monuments have Swedish-Norwegian runes on them but among these few must be mentioned the largest and most original of all, the Rök-Stone (fig. 18). The top and the four sides are covered with runes. The older forms of runes are also used together with different kinds of secret writing.

The stone was erected by a father in memory of his son and the inscriptions would seem to have in some degree magical purpose: to wreak vengeance on the son's slayers. The beginning of the inscription reads, *aft umuth stonta runaR thaR in varin faki fathir aft fakion sumi*; which means: "In memory of Vämod stand these runes. And Varin, the father, made them in memory of his son, overtaken by death."

The Swedish-Norwegian runes take an original form in Sweden. From the start they are characterized by a great reduction in the length of the cross strokes. In order to reduce as much as possible the length of the stroke whether written or incised also, the vertical strokes were as far as possible done away with.

Thus came into existence the so-called Hälsinge Runes (fig. 19), named after the region of Hälsingland, in which they have been found inscribed on a number of runic stones dating from the 11th century. It is, however, now established that they were known and used in the central region of Sweden adjoining Lake Mälaren, where very likely they were invented. The Hälsinge Runes are a kind of runic shorthand and they give us a clear indication that runes were widely used not merely on monuments but for all kinds of announcements: legal provisions, contracts, genealogies, poems, etc. The abbreviated form of the Hälsinge Runes is clearly due to the need of saving time, trouble and material.

In Norway there appeared in the 11th century a peculiar mixture of Swedish-Norwegian and Danish runes, which later led to an extension of the 16 letter alphabet to one better adapted to the northern sounds system—the pointed runes. The Danes probably got the idea from England at the close of the 10th century. The Anglo-Saxon rune for *y* was a *w* inside which an *i* was written. This rune is to be met with in Denmark before the year A.D. 1000, and after this model there was constructed out of the *i* a special letter for *e* and out of the *k* a special letter for *g*. These new letters are used generally in the Danish runes during the 11th century, although not consistently.

When the Danish and Swedish-Norwegian alphabet came to be blended during the 11th century in Norway, it would seem that towards the close of the century means were found to employ the wealth of letters thus produced to form a systematic representation of all the sounds in the language. The Latin alphabet, which had come into use with the introduction of Christianity, must have

been of service in the construction of this radical improvement of the runes as equivalent for sounds. Thus came into existence the completed pointed runic alphabet (fig. 20).

FIG. 19.—THE HÄLSINGE RUNES

Only in Gotland was the completed runic stave used to any great extent for inscriptions on monuments. But here and there in other parts of Scandinavia single monuments are to be found with inscriptions on them in the pointed runes. In Gotland there are about 250 erected stones adjacent to the churches and also out in the country parts, and the custom of raising such monuments persisted until much later. Gotland, moreover, had to begin with its own pointed runic alphabet, built up on the basis of the Danish runes alone. This was displaced later by the pointed runic alphabet in general use in Scandinavia.

The pointed runes were generally known and used in the whole of the Scandinavian North throughout the Middle Ages as the writing of cultured laymen. They were mainly used for private records. We possess a Danish legal manuscript, *Codex runicus*,

FIG. 20.—THE COMPLETED POINTED RUNIC ALPHABET

written in runes, dating from the end of the 13th century. There is extant, too, a prayer book of later date, which is evidently intended also for a layman not familiar with Latin. St. Bridget, who was a member of a Swedish family of nobles, spells Swedish, when she comes to acquire the use of the Latin alphabet, in the way in which she learnt as a child with runic letters. There is evidence of the use of runes in Gotland as late as the 17th century though they were widely reinforced by Latin letters.

Runes were kept up longer than elsewhere in outlying Swedish regions like Dalarna and Härjedalen, where they were used for making occasional notes down to our own times. (O. V. F.)

RUNNIMEDE or **RUNNYMEDE**, a meadow on the south bank of the river Thames, England, in the parish of Egham, Surrey. It is celebrated as the scene of the granting of Magna Carta

FIG. 17.—THE ÅNGBY STONE

FIG. 18.—THE RÖK STONE SEEN FROM THE FRONT

by King John on June 19, 1215. A tradition that the scene was Magna Carta, or Charter, island, higher up the river, probably arose about 1834, when G. S. Harcourt erected on it a castellated cottage in which he placed a stone tablet bearing an inscription to the effect that the charter was sealed there. Rummiede was presented to the nation by Lady Fairhaven in 1929.

RUNNING. The most primitive form of athletic exercise considered as a sport, running has been in vogue from the earliest times, and the simple footrace (*δρόμος*) run straight away from starting point to goal, or once over the course of the stadium (a little over 200 yd.), formed an event in the Greek Olympic pentathlon, or quintuple contest (*see GAMES, CLASSICAL*). There was also the race once over the course and return (*διδυμος*) and the *δολιχος*, a long race run many times (often as many as 12; i.e., about 2½ mi.) up and down the stadium. There was also the *δρόμος δελτιων*, a short race for warriors, who wore full armour and carried sword and shield. Except in the warriors' race, the Greek runners were naked, save occasionally for a pair of light shoes. No records of the times returned have been handed down, but the contests must have been severe since the ancient Olympic chronicles preserve the memory of several men who fell dead at the end of the long course. According to Virgil (*Aen. V. 286 et seq.*) running was practised in circus exhibitions in ancient Italy.

The best runners in the middle ages were most often found among the couriers maintained by potentates and municipalities. The Felchs, or Persian couriers, of the Turkish sultans, often ran from Constantinople to Adrianople and back, a distance of about 220 mi., in two days and nights. In districts of India and Africa not traversed by railways, native runners are still employed to carry the mails.

In all parts of Great Britain track, road and cross-country running have been popular forms of recreation for many centuries. Today practically all the sprint records are held by Americans, while many of those for the middle distances stand to the credit of European athletes.

Modern running is divided into three classes:

Sprinting.—Sprinting consists of running over short distances with a full and continuous burst of speed, the chief distances being 100 yd., 220 yd. and 440 yd., and the corresponding metric distances. Distances up to and including 220 yd. are, in the United States, called dashes. The course for sprint races, when run in the open air, is marked off in lanes for the individual runners. In the modern style of sprinting the result depends often upon the start. The old method of dropping a handkerchief was the worst way to give the starting signal, since the muscles react slowly to the impression of sight, less so to those of touch and most quickly to those of sound, a difference of ⅓ sec. in reaction amounting to more than 1 ft. in a run of 100 yd. All modern foot races are, therefore, started by the report of a pistol. Until 1887 all classes of foot runners commenced their races from a standing position. In that year Charles H. Sherrill, Jr., of Yale university, demonstrated an entirely new method known as the crouch, this method of starting becoming universal in a short time.

Experiments made with an electrical timing apparatus of his own invention by A. V. Hill, F.R.S., of the University of London brought to light many interesting points in connection with the physiological processes involved in severe muscular exercise in man. Hill's experiments indicated that 90% to 95% of the effort made by a sprinter travelling at top speed is expended in overcoming the frictional resistance of his own muscles. The force exerted by the first-class sprinter at maximum speed is equal to from 80% to 90% of his body weight, and in running 100 yd. he does sufficient work to lift himself from 240 ft. to 270 ft. into the air. He will bring into play approximately 8 h.p. and attain his maximum speed at 60 yd. or 70 yd. from the start, when he may be travelling as fast as 24 m.p.h. Approximately one second is lost in the starting process. After the 70 yd. mark is reached the runner begins to lose speed through fatigue occasioned by the rapid appearance of lactic acid in the muscles, as much as ½ oz. of such acid being secreted in the muscle substance

every second. In the course of a 200-yd. race the speed drops as much as 15% between 70 yd. and 190 yd.

None of the sprint records at mid-20th century was older than 1936, and the outstanding feature of modern sprinting during the Olympiads of 1936 to 1952 was the success of the U.S. athletes. In 1948 Melvin Patton made a world's 100 yd. record of 9.3 sec. The world's record of 10.2 sec. for 100 m. was shared by J. C. Owens (1935), H. Davis (1941) and H. N. Ewell (1948) of the U.S., L. B. LaBeach (1948), Panamá, and E. McDonald Bailey (1951), Trinidad. Patton was world's record holder for 220 yd. and 200 m. in 20.2 sec.

Races at 400 m. and 440 yd. are almost invariably run on a circular track, each runner being provided with his own lane, to which he must keep throughout the race, the starts being so staggered that each runner may traverse the full course. Until 1924 the theory was held that quarter milers could be divided into two categories. It was held that the sprinter type of runner should endeavour to start fast enough to secure a good position rounding the first bend, and should hold his pace for perhaps 100 yd., and then get into a "float" with a long swinging stride. He would make his dash for victory about 120 yd. from the tape. The middle distance type of quarter miler, on the other hand, was advised to keep out of the first struggle for position and to husband his strength for the final dash.

In 1924 Eric Liddell, Great Britain, consciously or otherwise, set a new fashion when he won the Olympic 400 m. in 47.6 sec., by going flat out from pistol flash to finishing post in one effort, thus making a new world's record. Other athletes were quick to see the value of this innovation and have made it the practice to run the distance as a race of exhaustion from start to finish. The Olympic games, 1932, showed an extraordinary runner in William A. Carr, U.S., who made a new 400 m. Olympic record of 46.2 sec., equalled in 1948 by A. Wint, Jamaica, who beat H. H. McKenley, Jamaica, holder of the world's record for 440 yd. in 46.0 sec. V. G. Rhoden, also of Jamaica, holder of the record for 400 m. at 45.8 sec., won the 1952 Olympic event and McKenley again finished second.

Middle-Distance Running.—Ben Eastman was *facile princeps* of middle distance runners. He held records of 440 yd. (46.4 sec.), 600 yd. (1 min. 9.2 sec.) and 880 yd. (1 min. 49.8 sec.). It was, however, Thomas Hampson, Great Britain, who exploded the theory that there should be a variation of 3 sec. in the pace at which the two quarter-miles of a half mile should be run. Hampson's theory was that each of the two quarter-miles should be run in the same time, as nearly as possible. Acting on this principle he made a world's 800 m. record of 1 min. 49.8 sec.

TABLE I.—World's Amateur Records to June 29, 1952*

Event	Time or Distance	Holder	Country	Date
100 yd.	9.3 sec.	M. E. Patton	U.S.	May 15, 1948
220 yd.	20.2 sec.	M. E. Patton	U.S.	May 7, 1949
440 yd.	46.0 sec.	H. H. McKenley	Jamaica	June 5, 1948
880 yd.	1:49.2 sec.	S. C. Goddard	Great Britain	Aug. 20, 1938
1 mi.	4:04.4 sec.	M. G. Whiffled	U.S.	Aug. 19, 1939
2 mi.	8:42.2 sec.	G. Haegg	Sweden	July 17, 1944
3 mi.	13:24.2 sec.	G. Haegg	Sweden	Aug. 4, 1945
4 mi.	18:30.8 sec.	V. A. Helio	Finland	Sept. 20, 1947
5 mi.	24:12.2 sec.	M. Hietanen	Czechoslovakia	Sept. 1, 1949
75 mi.	1 hr 17:28.6 sec.	M. Hietanen	Finland	Sept. 29, 1951
100 mi.	2:10.2 sec.	C. Owens	U.S.	June 20, 1936
		H. Davis	France	June 27, 1941
		L. B. LaBeach	Panamá	May 15, 1948
		H. N. Ewell	U.S.	July 9, 1948
		E. McDonald Bailey	Trinidad	Aug. 25, 1951
200 m.	20.2 sec.	M. E. Patton	U.S.	May 7, 1949
400 m.	1:00.2 sec.	V. G. Rhoden	Jamaica	Sept. 20, 1950
800 m.	1:46.6 sec.	K. Harbig	Germany	July 15, 1939
1,000 m.	2:37.4 sec.	O. K. Gustafsson	Sweden	Sept. 4, 1948
1,500 m.	3:43.0 sec.	M. Long	Sweden	July 15, 1948
		G. Haegg	Sweden	July 17, 1944
		L. Strand	Sweden	July 26, 1947
2,000 m.	5:07.0 sec.	G. Haegg	Sweden	June 30, 1952
3,000 m.	7:58.8 sec.	G. Haegg	Sweden	Sept. 29, 1951
5,000 m.	17:55.2 sec.	G. Haegg	Sweden	Sept. 29, 1951
10,000 m.	39:02.6 sec.	E. Zatopek	Czechoslovakia	Aug. 4, 1950
20,000 m.	50:51.8 sec.	E. Zatopek	Czechoslovakia	Sept. 29, 1951
30,000 m.	59:14.0 sec.	M. Hietanen	Finland	May 23, 1948
30,000 m.	1 hr. 38:54.0 sec.	V. Moskatshenkov	U.S.S.R.	Oct. 3, 1951
1 hr.	12 mi. 80 yd.	E. Zatopek	Czechoslovakia	Sept. 29, 1951

*The International Amateur Athletic Federation decided in 1952 that records would only be passed in the events included in Tables I and II.

TABLE II.—Relay Records to Aug. 4, 1952*

Event	Time	Holder	Country	Date
4 x 110 yd.	40.5 sec.	University of Southern California (La Fond, Anderson, Jordan, Talley)	U.S.	May 14, 1938
4 x 220 yd.	1:21.0 sec.	University of Southern California (Patton, Franzer, Pasquall, Stocks)	U.S.	May 20, 1940
4 x 440 yd.	3:00.4 sec.	University of California (Rene, Fenton, Barnes, Klemmer)	U.S.	June 10, 1941
4 x 880 yd.	7:20.2 sec.	U.S. National team (W. Ahlenfelter, Pearson, Barnes, Whitfield)	U.S.	Aug. 4, 1952
4 x 1 mi.	16:42.8 sec.	Göteborgs IF (Bengtsson, Bergqvist, Aberg, Eriksson)	Sweden	Aug. 5, 1950
4 x 1.6 mi.	23:20.8 sec.	U.S. National team (J. C. Owens, Metcalfe, Draper, F. Wyckoff)	U.S.	Aug. 9, 1935
4 x 1.6 mi.	23:20.8 sec.	University of Southern California (Patton, Franzer, Pasquall, Stocks)	U.S.	May 20, 1940
4 x 1.6 mi.	23:20.8 sec.	Jamaican National team (Wint, Lane, McKenley, Rhoden)	Jamaica	July 27, 1952
4 x 1.6 mi.	23:20.8 sec.	Swedish National team (Gren, Linder, Langard, Strand)	Sweden	Sept. 13, 1950
4 x 1.6 mi.	23:20.8 sec.	Göteborgs IF (Bengtsson, Eriksson, Aberg, Bergqvist)	Sweden	July 3, 1950

*The International Amateur Athletic Federation decided in 1938 that records would only be passed in the events included in Tables I and II.

when he won the Olympic title in 1932. Sydney C. Wooderson, England, in 1938 ran 880 yd. in the world's record time of 1 min. 49.3 sec., and in 1939 Rudolf Harbig, Germany, ran 800 m. in 1 min. 46.6 sec. Malvin Whitfield, U.S., in 1950 equalled Wooderson's record.

The other most important middle distance, which is regarded as the blue ribbon of athletics in England, is the 1 mi. At the time when Walter G. George (England) made his world's professional record of 4 min. 12.2 sec. in 1886, the theory obtained that the first lap should be fast and that the runner should rest himself as much as possible during the third quarter-mile. George's quarter-mile times were 58.5 sec., 63.25 sec., 66 sec. and 65 sec. Then, in the period 1920-31, Paavo Nurmi, Finland, evolved the theory of level-pace running and broke almost every world's record from a mile in 4-10.4 sec., to the one hour record of 11 mi. 1,648 yd. It was the opposition of the Swedish runner, E. Wide, which caused Nurmi to depart from his prearranged schedule of 62 sec. per quarter-mile when he made his world's record, referred to above, in 1923. Jules Ladoumègue, France, got nearer to the ideal when, in 1931, he reduced the record to 4 min. 9.2 sec. The year 1933 brought to light a new world's record breaker in John E. Lovelock, New Zealand, who ran a mile in 4 min. 7.6 sec., his theory being somewhat in the nature of a reversion to the principles advocated by George, except that it was Lovelock's belief that a man should train to run only one record-breaking race in any given year and to that end all training and preliminary competition should be subordinated.

The last word in the science of mile running had not, however, yet been said. In Lovelock's record-breaking race the second half-mile had been 1 sec. slower than the initial half-mile. Glenn Cunningham, U.S., when he set the world's record at 4 min. 6.8 sec. in 1934, ran the second half of the race 4.2 sec. faster than the initial half-mile. The record was lowered to 4 min. 6.4 sec. by Sydney Wooderson, Great Britain, in 1937, his second half-mile taking 1.4 sec. longer than the first. In 1936 Lovelock won the Olympic 1,500 m. title in the new world's record time of 3 min. 47.8 sec. which approximates to 4 min. 4.4 sec. for the full distance of 1 mi. He also ran the second half of the race faster than the first. The following schedule sets out the quarter-mile lap times of four of the fastest miles run compared with George's time in 1886:

Yd.	W. George (England) 1886	J. E. Love- lock (New Zealand) 1934	G. Cun- ningham (U.S.) 1934	S. C. Wood- erson (Great Britain) 1937	G. Haeg (Sweden) 1945
1st 440	58.5	61.4	61.8	58.6	56.6
2nd 440	63.25	62.2	63.7	64.0	61.9
3rd 440	66.0	65.1	61.8	64.5	61.9
4th 440	65.0	58.0	59.5	59.2	61.7
2 mile	4:12.75	4:07.6	4:06.8	4:06.4	4:01.4

It is significant that nothing approaching W. G. George's performance of 1886 was produced until 1937, in which year Norman Taber, an amateur of Brown University, U.S., by means of a specially framed handicap, beat George's record by 3/20 sec. The spell of nearly 30 years having been broken, new and progressively better performances were produced, and during the next 20 years the record for the 1 mi., or its equivalent, 1,500 m., was broken no less than seven times. Cunningham's mile in 4-06.8 sec. was almost 6 sec. better than George's record, while Lovelock's com-

parative time for 1,500 m. would be 2 sec. better than the record made by Cunningham, whom Lovelock beat when he won the Olympic title in 1936.

During and after World War II few things were more remarkable than the advance in 1 mi. performances: the 20 fastest all beat the time of 4 min. 10.4 sec. returned in 1933 by Paavo Nurmi, Finland, as the world's record. Of the world's 20 best milers in 1946, 9 were Swedish, 6 were from the United States, 2 were French and 1 was English. The best times were as follows: Haeg, Andersson, Persson, Gustavsson and Strand, Sweden, Hulise and Dadds, U.S., and Wooderson himself, had all beaten Wooderson's 1937 world record of 4 min. 6.4 sec. and Ahlsen, Sweden, had equalled it.

The 2 mi., although not a standard championship event, is popular at indoor meetings and corresponds at the U.S. Inter-Collegiate Outdoor championships to the 3 mi. at the English Oxford and Cambridge sports. In 1944 Gunder Haeg, Sweden, established a new world's record by running 2 mi. in 8 min. 42.8 sec.

Long-Distance Running.—This includes all flat races from the 3 mi. upward, as well as steeplechasing, road and cross-country running. Great Britain was for centuries the home of long-distance running, and for many years all world's records from two to ten miles were held by Alfred Shrubbs, England. Of the remaining distance records up to 30,000 m. and the 1 hr. run, the longest distances recognized by the International Amateur Athletic Federation, seven were held at mid-20th century by Finland, three by Sweden and one by Czechoslovakia. It is perhaps remarkable that none of the world's long-distance records was held by the U.S. The decline of British supremacy began with the advent of two great foreign runners, Jean Bouin, France, and Hannes Kolehmainen, Finland. Finland established a long line of world's champions. Swedish athletes showed remarkable development during the years of World War II at distances from 1,500 m. and 5,000 m., challenging even the supremacy of the Finns. The Finns, despite the rigours of two stern campaigns in World War II, produced and sustained great runners such as Taisto Mäki who in 1939 made a world's record by running 20,000 m. in 1 hr. 3 min. 1.2 sec. and Erkki Tamila, who was fourth in the Olympic marathon, 1936, and in 1939 made what remained, until beaten by M. Hietanen in 1948, the world's 25,000 m. record of 1 hr. 21 min. 27.0 sec. The record made by Paavo Nurmi in 1928 of running 11 mi. 1,648 yd. within the space of one hour was broken by Viljo Heino, also a Finn, who in 1944 also made new figures at five and six miles. Heino was the first man to get inside 50 min. for 10 mi., his time being 49 min. 41.6 sec., and he went on to complete the 1 hr. by covering 12 mi. 28 yd. He was the first man ever to beat 12 mi for the time-running record, which E. Zatopek of Czechoslovakia has since improved.

In England the championship track distances are three and six miles. In the U.S., however, the Amateur Athletic union for a few years adopted the 5,000 and 10,000 m. events which figure in the Olympic games. There is also in each case the marathon race of 26 mi. 385 yd. A marathon race of 40,000 m. was held in the 1896 Olympic games, but the modern distance of 26 mi. 385 yd. was first held in 1908 in London and became the standard from 1924 in the Olympics. As courses vary considerably no records are recognized. This classic of the Olympic games has been won by Argentina, Finland, France and the U.S. (twice by each country), while Greece, Japan, South Africa and Czechoslovakia each have had one victory.

Steeplechasing was originally only a cross-country run over a course plentifully provided with natural obstacles; but the modern steeplechase takes place partly on the grass and mainly on the cinder track of the athletic field. A water jump must be included, in addition to which there are four flights of hurdles 3 ft. in height. The championship distance in England is 2 mi.; in the U.S. and at the Olympic games 3,000 m. The U.S. won the first two Olympic steeplechases, at 2,500 m., Great Britain taking two other races at 3,300 m. and 4,000 m., but after the distance was stabilized at 3,000 m. in 1920, when P. Hodge of Great Britain was victorious, the subsequent four Olympic titles went to Finland, Sweden winning in 1948 and the U.S. in 1952.

Cross-Country Running had its inception with the founding of the Crick run at Rugby school in 1837, followed by many other famous schools who also held annual cross-country races. About 30 years later the Thames Hare and Hounds held cross-country runs and races as a winter sport, and in a few years many other clubs were formed throughout England. Many amateur athletes use this winter sport, often formerly termed paperchasing, as a means of keeping fit and developing stamina for track athletics. English championships over the senior distance of 10 mi. were first held in 1876 and of the 64 contests held up to 1952, the famous Midlands club, Birchfield Harriers, won on 26 occasions. The number of runners in this event increased from 33 in the first race to 450 in 1949. In England races are limited for juniors (18 to under 21 years) to 6 mi. and for youths (over 16 to under 18) to 3 mi. The first international race was held in 1898 between England and France, and an international championship was instituted in 1903 between England, Ireland, Scotland and Wales. In 1907 France first competed, followed by Belgium in 1923, while Italy, Luxembourg, Spain and Switzerland also competed in 1929. From 1903 until 1949 England won 25 times, France winning on 9 occasions in this event organized by the International Cross-Country union. The sport is popular in many other countries.

In the Olympic games of 1912 an 8,000-m. race was held and won by Hannes Kolehmainen, Finland, Sweden winning the team race; in 1920 and in 1924, when the distance was increased to 10,000 m., Paavo Nurmi won, Finland also winning the team races. The event was not held thereafter as it was not considered suitable for inclusion in the summer Olympic games.

Relay Racing.—This form of competition has long been practised in the U.S. and has become popular throughout the world. Relay races are usually run by four men, each going a quarter of the distance. From 1911 to 1926 only one relay race was included in the English championships. This was really a medley race in which four men ran 880, 220, 220 and 440 yd., respectively. In 1927 the medley race was abandoned and two other relay races substituted, i.e., a 440 yd. relay, in which each of the four runners goes 110 yd., and a mile relay (4 × 440 yd.).

The U.S. national championship relay distances are 440 yd., 880 yd., 1 mi. and 2 mi., four runners representing each team, and each running an equal distance.

The Olympic relay distances are 400 m. (437.45 yd.) and 1,600 m. (almost a mile).

This method of racing was started in the United States about 1890, on the model of the Massachusetts firemen's "bean-pot" race. The old method was for the men running the second quarter of the course each to take over a small flag from the first man as he arrived, before departing on their own stage of the race, at the end of which they, in their turn, handed on their flags to the awaiting next runners. The flags, however, were considered cumbersome, and for a time it was sufficient for the outgoing runner to touch or be touched by his predecessor. Nowadays a hollow cylinder of wood, constituting a baton, is carried and must be exchanged between lines drawn at right angles to the side of the track 11 yd. or 10 m. on each side of the starting line for each particular relay.

As the progenitor of relay racing, it is not surprising that the success of the U.S. has been phenomenal. Of the Olympic tests at 4 × 100 m. instituted in 1912, Great Britain won the initial contest, after which time the U.S. won the subsequent seven titles. The 4 × 400 m. Olympic relay was instituted in 1912, the U.S.

winning upon every occasion except 1920 and 1936, in which Great Britain and in 1952 Jamaica proved victorious. Of the world's records at the ten standard distances (metric and English measure) at mid-20th century, seven were held by U.S. teams, three by Sweden.

RUNNING WATER. Water flowing down slopes contributes more than any other external agent to the sculpture of the surface forms of the land. As it flows from higher to lower levels, the potential energy it possesses because of its height above sea level is changed into energy of motion at a rate that is the greater the steeper the slope down which it flows. Most of its work is done in the channels of streams and consists principally of the transportation of weathered rock material toward the sea or toward the enclosed depressions into which the local streams of arid regions flow. Part of this rock waste is transported in solution. Although it often constitutes an appreciable fraction of the load carried by a stream, dissolved matter is mechanically a part of the water and affects its physical behaviour only by making it slightly denser and more viscous. The far larger part of the loads of streams consists of undissolved fragments, to which the water transfers a part of its momentum.

Turbulence.—Only a thin film of the water of a stream is at any time in actual contact with its bed, and so in a position to impart momentum to the material over which it flows. The momentum of the rest of the water must be conveyed through the fluid to its bed. Except for intermolecular friction through the film next to the bed, the transfer is effected by the irregular motion of water within the stream toward and away from the bed; that is, by turbulence. Under the pull of gravity, the water attains its highest speed in those parts of the cross section of the stream that are farthest from the bed; the parts that flow, so to speak, on a moving bed of other water. The more slowly moving water near the bed exerts a restraining pull upon it. The stress of the mechanical couple between the faster and the slower water in the cross section causes parcels of rapidly moving water to become detached from the interior parts of the cross section and force their way through the more slowly moving water toward the bed. A part of their momentum is expended in displacing the water through which they move, and a part in friction with the bed when they reach it.

Invasion of the passive layers of water near the bed by the active parcels from the interior of the stream forces equal volumes of the slower passive water away from the bed. Arriving in the middle parts of the cross section, the water thus displaced is speeded up, and in turn contributes active parcels that invade the slower water near the bed. The turbulent interchange of water between the central and the peripheral parts of the cross section of a stream regulates its average speed and the distribution of velocity in its cross section. With a given discharge through a uniform channel, the stream attains a constant average speed at which the energy imparted to the water by the acceleration of gravity is expended in friction with the bed and in internal friction.

Transport of Sediment: Traction and Suspension.—If the bed of a stream consists wholly or in part of rock fragments, the frictional drag exerted by the water may propel a part of the bed material downstream. This form of propulsion is called traction, and the material so propelled constitutes the bed load. The fragments that make up the bed load vary in size with the energy of the stream, from boulders to fine silt; in most streams the bed load consists of sand. Rock particles transported by streams are constantly reduced in size by mutual abrasion, so that long rivers that flow through plains in their lower courses arrive at their mouths with their bed loads reduced to fine sand or silt.

If the channel of a stream is cut in a thick accumulation of unconsolidated rock fragments, the water propels only the superficial

layers of its bed. But if the layer of bed load is thin and all of it is in motion over a surface of solid rock, the load abrades the solid bed, and thus deepens it. Abrasion of the beds of streams by their loads is the mechanism by which they cut channels in consolidated rock; the cutting is greatly aided by fractures and other inhomogeneities in the rock. By itself, a stream can cut only a narrow gorge having the width of its channel. Valleys, which have cross profiles that approximate the shape of a more or less open V, are produced by a combination of downcutting by streams and retreat of the valley sides through rock weathering and movement of rock waste down slope to the stream channels. Most of the load carried by a stream is contributed by the slopes of its valley and those of its tributaries, not by abrasion of its channel. Flat bottoms of valleys are usually the result of a partial filling of the valleys by deposition of load.

In addition to their bed loads, streams carry rock fragments suspended in the water by the upward components of turbulence. A sharp distinction cannot be drawn between suspended and bed load, since particles are continually settling out and being picked up again. Both propulsion of bed load and the passage of fragments into suspension depend on the turbulent interchange of water between the interior of the stream and the vicinity of the bed. Bed load is propelled by the transfer of momentum from the active parcels. Passive water is displaced abruptly in front of an active parcel arriving at the bed, and forced away from the bed. The upward speed of the water thus forced from the bed carries into suspension fragments that are sometimes as large as fine gravel. The upward speed of the displaced water is gradually lost as it moves into the interior of the stream and the coarsest material taken into suspension soon settles back to the bottom. Finer particles, which are held in suspension by weak turbulence, are carried long distances.

In flood, a stream propels a thicker layer of bed load than at lower stages, and takes more and coarser material into suspension. As a flood subsides, sediment is deposited over all the area covered by water, including the channel itself. The bed is built up again to its low-water level, and the deeper bed material that was in motion during the flood becomes stationary again. Deposits laid down in the subsiding stages of high water are to be seen along almost all streams. In mountain torrents, they consist of boulders in or at the sides of the channel, or of bars composed of cobbles and coarse gravel. In streams having smaller gradients, they are usually bars of gravel or sand at the sides of the channel. Silt and clay settle out from quiet flood waters far from the channels in which they were taken into suspension.

Meandering.—The interaction between stream and channel, which induces a continuous turbulent displacement of masses of water within the cross section, seems to permit an approximately stable state of flow only when the current swings from side to side in a rhythm appropriate to the size of the stream. Such a pendulation is observed in all streams, and the channels are moulded to fit the pendulating current. The bed load does not travel downstream as a smooth sheet, but in the form of bars that lie alternately on opposite sides of the channel, connected by diagonal shallows. Opposite each bar is a pool or deep, in which the highest speed of water in the local cross section is observed. The thread of maximum speed swings from side to side, especially at low stages, passing from one deep to the next one downstream.

The lateral bars grow sideways into the adjacent deeps, narrowing them and thus increasing the speed of the water through them. If the side of the channel opposite the bar consists of unconsolidated material, it is undermined and caves into the stream and the caving material becomes part of the load, some of it to be added to bars downstream. Opposite each bar the channel is shifted sideways in the direction of the undermined bank and becomes sinuous. Smoothly curved sinuosities so produced are meanders. Some degree of meandering is seen in all streams that flow in channels cut in unconsolidated material stable enough to form channel walls but capable of being undermined and transported by the stream. Meanders are formed most readily in channels cut in material that consists of or contains fragmental material intermediate in coarseness between sand and clay. Channels cut in

sand sometimes meander to a limited extent, but usually become broad and shallow, without the juxtaposition of bars and deeps that produce meanders. Channels cut in clay do not meander, since clay resists undercutting. The banks of a meandering stream are cut most rapidly in the downstream parts of its bends, and the meanders therefore migrate bodily down the valley. Variations in the resistance of channel walls to undermining induce distortions of meanders. Almost all accumulations of unconsolidated rock differ in resistance from point to point, and streams flowing through them often display distortions of meanders such as angular turns and exaggerated loops that nearly return on themselves. It is the last-named bends that are most likely to be cut off at flood stages and become, by the silting up of their ends, oxbow lakes.

Changes in Stream Gradients.—By transporting rock material and eroding their beds, streams are constantly lowering the land surfaces they drain, and so reducing their gradients. Gradients may also be increased or diminished by the action of the internal forces that lift or depress, tilt or warp the land surfaces. All changes in their gradients change the ability of streams to keep their burden of rock fragments moving and to deepen their channels. An increase in gradient enables a stream to cut its channel deeper, and so to leave the deposits outside its channel above its new level as river terraces. Meanders are cut down, even into underlying consolidated rocks. Where highlands are uplifted across the courses of rivers, they are often able to cut their channels down as fast as the land rises. They then carve gorges through the rising blocks of land. An increase in the rate of downcutting by a stream is often called rejuvenation, from a fancied analogy between the history of streams and the life of organisms. Diminution of the gradient of a stream causes it to deposit part of its load. The material deposited, by raising the floor of the valley to a wider part of its V-shaped profile, produces a flood plain. If weak and resistant rocks alternate along the course of a river, the gradient of the river and the declivity of the tributary slopes of the land become adjusted so that they are gentler in weak than in resistant rocks.

Effect of Reduction of Load.—Valleys of the regions through which flowed the melt water from the continental glaciers of the Pleistocene period display the results of overloading during that time and of a subsequent reduction of the load fed into streams. In North America, most of the drainage from the edge of the melting continental ice sheet found its way to the sea through the northern streams of the Mississippi system. The Ohio and Missouri rivers and their northerly tributaries carried enormous quantities of debris from the edge of the ice, depositing part of it in their valleys and discharging the rest into the Mississippi, which in turn built a vast depositional plain southward from near the mouth of the Ohio. Since the disappearance of the ice sheet, the rivers have cut their channels deeper, leaving the remaining rock waste as terraces.

Changes at the Mouths of Streams.—All changes in the level of the sea or of lakes affect the streams that discharge into them. A fall in sea or lake level steepens the gradients of the streams, and they deepen their channels, first near their mouths. A wave of channel-cutting progresses upstream at a rate determined by the resistance of the channels to erosion. The relative heights of land and sea have had a complicated history which is not easy to untangle. It is certain, however, that the lower courses of streams that flow into the sea have been strongly affected by the world-wide changes in sea level that resulted from the removal of water to form the glaciers of the Pleistocene period, and the subsequent return of that water to the sea as the glaciers melted. The effects of such general changes in sea level are superimposed on the changes in height of the land produced by the earth's internal forces.

Streams also change their own gradients by deposition at their mouths and hence ultimately throughout their courses. The sediment they bring to the sea is deposited promptly, since at their mouths their gradients vanish and provide no more energy to propel bed load or maintain turbulence. Sediment can be removed from the vicinity of a river mouth only by currents in the body

of water into which the river flows. Where the range of the tide is large, tidal currents prevent the accumulation of stream-borne rock waste at the mouths of rivers. But where rivers flow into parts of the sea in which tidal action is weak, or into completely enclosed seas or lakes, their burden of debris accumulates to form deltas, the terminal deposits of rivers. As a delta grows forward, the length of the stream is increased, while the vertical distance from its mouth to any point upstream remains unchanged. Its gradient is therefore reduced, and with every extension of the delta sediment must be deposited along the whole length of the stream. By building a delta a stream thus induces a continuous filling of its valley. The great flood plains of the world are extensions upstream of deltaic deposits. As the delta grows forward and upward, and the flood plain is built up accordingly, more sediment is deposited in and near the channel than on the parts of the plain at a distance from the river. Hence the channel is lifted to a level higher than the more remote parts of the flood plain. The highest parts of the plain are next to the river, in the form of embankments called natural levees. From these natural dikes the surface of the plain slopes away from the river toward the sides of the valley.

Basins of Interior Drainage.—The water that runs off the land surface to the sea is the excess of precipitation over the water that evaporates. Toward the dry parts of the continents this excess becomes progressively less, and finally evaporation disposes of all the precipitation that falls. The climatic distinction between humid and arid regions produces differences in the surface forms sculptured by running water. Crustal disturbances frequently make depressions that have no outlets to the sea. In humid climates, streams may cut down outlets as fast as barriers are uplifted, or the depressions may be at first occupied by lakes. Lakes are, however, relatively short-lived, since the streams that flow into and out of them fill them with sediment and deepen the channels that drain them. Surface streams in humid climates thus act to maintain continuous slopes of the land all the way to the sea. Not all the precipitation that falls in dry regions is immediately evaporated or absorbed by the ground. Particularly in highlands, ephemeral runoff transports rock waste and excavates valleys. In the depressed parts of the surface, however, the rock waste from the neighbouring highlands accumulates to great depths, gradually filling them and lapping up against the slopes of the highlands. The water that flows out into the depressions soaks into the dry rock waste or spreads out on the surface and evaporates. All the continents possess basins of interior drainage, with their characteristic features: highlands flanked by long slopes of fragmental rock material that extend out into enclosed depressions, the lowest parts of which are occupied permanently or temporarily by shallow salt lakes. So long as their climates remain arid, these basins are exempt from the rule that land surfaces that drain to the sea are continuously lowered toward sea level. The elevations of arid basins are fixed by the primary disturbances that produced them, whether they lie below sea level or thousands of feet above it.

RUODLIEB, a romance in Latin verse by an unknown German poet who flourished about 1030; he was almost certainly a monk of the Bavarian abbey of Tegernsee. The poem is one of the earliest German romances of knightly adventure, and its picture of feudal manners gives it value as an historical document.

The best edition is by F. Seiler (Halle, 1882).

RUPEE, the standard coin of the monetary system in India and Pakistan (Hindustani *rupiya*, from Sanskrit *rupya*). A silver coin of 175 grains troy, called *tanka*, approximating to the rupee, was struck by the Mohammedan rulers of Delhi in the 13th century; but the rupee itself, of 179 grains, was introduced by Sher Shah in 1542. The English at first followed various indigenous standards; but since 1835 the rupee has uniformly weighed 180 grains, containing 165 grains of pure silver. The weight of the

rupee (one *tola*) is also the unit upon which the Indian standard of weights is based.

The term "lakh" (from the Sans. *laksha*, 100,000) is colloquially used in India as signifying 100,000 rupees (written Rs. 100,000). It appears constantly in trade returns. The term "crore" (from the Hindustani *haror*) is similarly used to denote 100 lakhs, or 10,000,000 rupees. Down to about 1873 the gold value of the rupee was 25s., and ten rupees were thus equal to £1; but after 1873, owing to the depreciation of silver, the rupee at one time sank as low in value as 1s. In order to provide a remedy the government of India decided in 1893 to close the mints, and in 1899 to make the rupee legal tender at 15 to £1. The government also engaged to sell council drafts on India to an unlimited amount at a price from 1s. 4½d. to 1s. 3½d. per rupee. This worked satisfactorily, owing to the fact that normally India exports more than it imports. Should there be a trade balance temporarily adverse to India, so that the market quotation of sterling against the rupee fell below 1s. 3½d., the government undertook to sell reverse council drafts on London. The exchange was thus maintained at 1s. 4d., and the rupee linked to a gold currency, sterling, with the sale of council and reverse council drafts as a somewhat artificial substitute for the shipment of gold.

The success of this system depended upon two conditions. First, the bullion value of the rupee must not rise above 1s. 4d., otherwise it would pay the public to melt down rupees for their silver content. Secondly, the secretary of state must have sufficient rupees at his command to enable him to redeem such quantities of council drafts as the public wished to buy. Until the outbreak of World War I, both these conditions were fulfilled. The secretary of state had little difficulty in amassing sufficient rupees to meet his engagements, while it was only found necessary to sell reverse councils on three occasions after 1900.

The Rupee Crisis.—World War I altered the situation. India's exports increased owing to the Allies' demand for raw materials, while imports of manufactured goods were forcibly curtailed owing to the inability of belligerent countries to produce them. Also the campaign in Mesopotamia was financed in rupees. All these causes led to a greatly increased demand for rupees, and by 1916 the secretary of state was experiencing great difficulty in obtaining enough to meet in full the demand for council drafts.

At the same time, partly owing to troubles in Mexico, the price of silver rose; in short, by 1916 the two conditions on which the Indian currency was based were ceasing to operate. Radical modifications had to be introduced. The sale of council drafts was rationed, and their price gradually increased in sympathy with that of silver. All gold imported had to be sold to the government, and the private importation of silver was prohibited. Rupee notes could be issued to a certain extent, but the danger of inconvertibility had to be watched. But the quantity of silver available still fell below the country's requirements, and the convertibility of the note issue was threatened. In April 1918 the Pittman act enabled the U.S. government to sell 200,000,000 fine ounces of silver to India at a price of £1.05 per fine ounce. This shipment eased the situation and preserved the currency till the Armistice.

In May 1919 the Babinington-Smith committee sat to evolve a new system, made necessary by the grave modifications caused by war measures. It recommended the fixation of the exchange at Rs. 10 to the gold sovereign; the sale by open tender of council and, if necessary, of reverse council drafts; free importation and exportation of gold and free importation of silver. Owing to unforeseen circumstances, the scheme broke down almost immediately. The report was issued at the moment when the prices of commodities, including silver, were at their highest; and the slump followed. The price of silver collapsed, and rendered unnecessary the raising of the value of the rupee. Also the 1921 trade depression had a serious effect in India. The demand for raw materials dried up, but meantime goods ordered from Europe continued to arrive up till the end of 1921. Consequently, a heavy adverse trade balance set in. The rupee began to fall, until finally it arrived at about the prewar level of 1s. 4d. The sale of reverse

councils was quickly found to be too expensive a remedy, and was abandoned.

By 1923 conditions had improved, and the excess in imports of 1921 had largely been absorbed. The Babington-Smith report still remained nominally in force for a few years, but it became necessary to reconcile the official currency system with the facts of the case. The Hilton-Young committee was appointed, and presented its report in 1926. In 1927 the government published three bills embodying the recommendations of the Hilton-Young committee. The first bill was for the purpose of establishing a gold standard currency for British India and for constituting a reserve bank of India, the second amended the Imperial Bank Act of 1920 and the third amended the Coinage Act of 1906 and the Paper Currency Act of 1923, in order to empower the government in matters relating to the purchase of gold and the sale of gold exchange.

This third bill was the subject of bitter controversy but finally passed the legislature by a narrow majority and the Indian Currency bill became law on April 1, 1927.

The act established the ratio of 15.6d. to the rupee by enabling the government to purchase gold in unlimited quantities at the Bombay mint in the form of bars containing not less than 15 oz. at the price of 21 rupees 3 annas 10 pies per *tola* of fine gold. Holders of silver rupees and paper notes were *entitled* to obtain either gold or sterling for immediate delivery in London, provided the value involved was not less than 165 *tolas* of fine gold at the above rate. Sovereigns and half sovereigns ceased to be legal tender in India. Thus, the Currency Act of 1927 might be said to have established a gold bullion-sterling exchange standard.

The Reserve Bank of India act was passed by the legislative assembly in 1934 and the bank began to function on April 1, 1935. The new institution took over the management of the currency department of the government of India and the assets of the gold standard reserves were transferred to the bank to be combined with the assets of the currency department. The banking department was opened on July 1, 1935. The share capital of the reserve bank was 50,000,000 rupees fully paid up and the reserve fund of 5 crores was provided by the government in the form of rupee securities. The bank's offices were at Bombay, Calcutta, Delhi, Madras and Rangoon. The exchange value of the rupee fell to the statutory minimum point of 1s. 5½d. in June 1938, but the situation improved shortly after and the exchange rates steadily improved to 1s. 5½d. in March 1939. On the whole, the exchange rates remained steady until the outbreak of World War II in Sept. 1939.

On the declaration of war, the government delegated to the reserve bank authority to administer control of dealings in coins, bullion, securities and foreign exchange. Measures taken shortly after were designed to prevent the export of capital from India and check wartime speculation in exchange. In May 1940 a system of licensing imports in order to conserve foreign exchange was introduced by the government.

After the partition of the subcontinent in 1947, both India and Pakistan continued the rupee as their monetary unit. The exchange rate was different, however, the Indian rupee being valued at 20.87 U.S. cents and the Pakistani rupee at 30.22 cents, or at about 1s. 6d. and 2s. 2d. respectively, in the early 1950s. (See also CURRENCY.) (N. E. C.; W. D. C.)

RUPERT (HRODBERT), ST., according to the *Gesta Sancti Hrodberti*, which dates from the ninth century, a kinsman of the Merovingian house, and bishop of Worms under Childbert III (695-711). At the invitation of the duke of Bavaria, Theodo II, Rupert went to Regensburg (Ratisbon), where he began his apostolate. He founded the church of St. Peter near the Walersee, and subsequently, at Salzburg, the church of St. Peter, together with a monastery and a dwelling for the clerks, as well as a convent for women "in superiori castro Iuvavensium." He died at Salzburg. He is regarded as the apostle of the Bavarians.

RUPERT (1352-1410), German king, and, as Rupert III, elector palatine of the Rhine, was a son of the elector Rupert II and Beatrice, daughter of Peter II, king of Sicily. He was born at Amberg on May 5, 1352, and succeeded to the government of the Palatinate on his father's death in 1398. On Aug. 21, 1400, having helped depose King Wenceslaus at Oberlahnstein, Rupert was elected German king at Rense, and crowned at Cologne on Jan. 6, 1401. An expedition to Italy against Gian Galeazzo Visconti, duke of Milan (1401-2), proved a failure, but he was recognized by Pope Boniface IX in Oct. 1403. After some years of struggle with the anarchy in Germany and the partisans of Wenceslaus, Rupert died at Landskron near Oppenheim on May 18, 1410. He was buried at Heidelberg. He married Elizabeth, daughter of Frederick IV of Hohenzollern, burgrave of Nuremberg, and left three sons and four daughters. Rupert, who earned the surname of *clemens*, was brave and generous, but his resources were totally inadequate to bear the strain of the German kingship.

RUPERT, PRINCE, COUNT PALATINE OF THE RHINE AND DUKE OF BAVARIA (1619-1682), third son of the elector palatine and "winter king" of Bohemia, Frederick V, and of Elizabeth, daughter of James I of England, was born at Prague on Dec. 17, 1619. A year later his father was defeated at the battle of the Weisser-Berg, near Prague, and driven from Bohemia. After many wanderings the family took refuge in Holland, where Rupert's boyhood was spent. In 1633 the boy was present at the siege of Rheinberg in the suite of the Prince of Orange, and in 1635 he served in this prince's bodyguard. In 1636 he paid his first visit to England, was entered as an undergraduate, though only nominally, at St. John's college, Oxford, and was named as the governor of a proposed English colony in Madagascar. But this scheme did not mature, and Charles sent his nephew back to Holland, having, however, formed a high opinion of his energy, talent and resolution. In 1637 he was again serving in the wars, and in 1638, after displaying conspicuous bravery, he was taken prisoner by the imperialists at the action of Vlotho (17th October) and held in a not very strict captivity for three years. In 1641 he was released, and, rejoining his mother in Holland, was summoned to England to the assistance of his uncle, for the Great Rebellion was about to break out.

The Civil War.—In July 1642 he landed at Tynemouth. Charles at once made him general of the horse and independent of Lord Lindsey, the nominal commander of the whole army. From this point until the close of the first Civil War in 1646 Prince Rupert is the dominant figure of the war. His battles and campaigns are described in the article GREAT REBELLION. He was distinctively a cavalry leader, and it was not until the battle of Marston Moor in 1644 that the Royalist cavalry was beaten. The prince's strategy was bold as well as skilful, as was shown both in the Royalist movements of 1644 which he proposed, and in the two far-ranging expeditions which he carried out for the relief of Newark and of York. In Nov. 1644, in spite of the defeat at Marston Moor, he was appointed general of the king's army. But this appointment, though welcome to the army, was obnoxious to the king's counsellors, who resented the prince's independence of their control, to some of the nobility over whose titles to consideration he had ridden roughshod, and to some of the officers whose discipline and rapacity were likely to be repressed with a heavy hand. These dissensions culminated, after the prince's surrender of Bristol to Fairfax, in a complete break with Charles, who dismissed him from all his offices and bade Rupert and his younger brother Maurice seek their fortunes beyond the seas.

Rupert's character had been tempered by these years of responsible command. By 1645, although the parliamentary party accused him not merely of barbarity but of ingratitude for the kindnesses which his family had received from English people in the days of the Palatinate War, Rupert had in fact become a good Englishman. He was convinced after Marston Moor

that the king's cause was lost, in a military sense, and moreover that the king's cause was bad. When he surrendered Bristol without fighting to the uttermost, it was because Fairfax placed the political issue in the foreground, and after the capitulation the prince rode to Oxford with his enemies, frankly discussing the prospect of peace. Already he had deliberately advised Charles to make peace and had come to be suspected, in consequence, by Charles's optimistic adviser Digby. But to Charles himself the news of the fall of Bristol was a thunderbolt. "It is the greatest trial to my constancy that has yet befallen me," he wrote to the prince, "that one that is so near to me in blood and friendship submits himself to so mean an action." Rupert was deeply wounded by the implied stain on his honour; he forced his way to the king and demanded a court-martial. The verdict of this court smoothed over the matters for a time, but Rupert was now too far estranged from the prevailing party at court to be of any assistance, and after further misfortunes and quarrels they separated, Charles to take refuge in the camp of the Scots, Rupert to stay, as a spectator without command, with the Oxford garrison. He received at the capitulation a pass from the parliament to leave England, as did also his faithful comrade Maurice.

For some time after this Rupert commanded the troops formed of English exiles in the French army and received a wound at the siege of La Bassée in 1647. Charles in misfortune had understood something of his nephew's devotion and wrote to him in the friendliest terms, and though the prince had by no means forgiven Digby, Colepeper and others of the council, he obtained command of a Royalist fleet. The king's enemies were now no longer the Presbyterians and the majority of the English people but the stern Independent community, with whose aims and aspirations he could not have any sympathy whatever. A long and unprofitable naval campaign followed, which extended from Kinsale to Lisbon and from Toulon to Cape Verde. But the prince again quarrelled with the council and spent six years (1654-60) in Germany, during which period nothing is known of him, except that he vainly attempted (as also before and afterward) to obtain the apanage to which as a younger son he was entitled from his brother the elector palatine. At the Restoration he settled in England again, receiving from Charles II an annuity and becoming a member of the privy council. He never again fought on land, but, turning admiral like Blake and Monk, he played a brilliant part in the Dutch Wars. He died at his house in Spring Gardens, Westminster, on Nov. 29, 1682.

Apart from his military renown, Prince Rupert is a distinguished figure in the history of art as one of the earliest mezzotintists. It has often been said that he was the inventor of mezzotint engraving, but this is erroneous, as he obtained the secret from a German officer, Ludwig von Siegen. One of the most beautiful and valuable of early mezzotints is his "Head of St. John the Baptist." He was also interested in science, experimented with the manufacture of gunpowder, the boring of guns and the casting of shot and invented a modified brass called "prince's metal."

Prince Rupert was duke of Cumberland and earl of Holderness in the English peerage. He was unmarried, but left two natural children: one a daughter who married Gen. Emmanuel Scrope Howe and died in 1740, and the other a son, whose mother (who claimed that she was married to the prince) was Frances, daughter of Sir Henry Bard, Viscount Bellamont. The son was killed in 1686 at the siege of Buda.

See E. Warburton's *Life of Pr. Rupert* (1849) and additional authorities quoted in the memoir by C. H. Firth in the *Dict. Nat. Biog.*

RUPERT [RUPPRECHT-MARIA-LUITPOLDT FERDINAND VON WITTELSBACH] (1869-), German prince, the eldest son of King Louis III of Bavaria, was born on May 18, 1869, at Munich. In 1906, after extensive travels, he was appointed to the command of the 1st Bavarian army corps. At the outbreak of World War I he was commander of the Bavarian troops (the 6th German army) and led them to victory in the great battles fought in Lorraine (Aug. 20-22, 1914). In the following October he was placed in command on the German front in Artois and southern Flanders.

Having been advanced to the rank of field marshal, he was entrusted in the spring of 1917 with the chief command of the northern group of armies on the western front. In 1900 he married Marie Gabrielle, a sister of the queen of the Belgians, who died in 1912; and in 1921 he married Princess Antoinette of Luxembourg and Nassau. He renounced his rights to the Bavarian crown on Nov. 8, 1918, and was allowed to reside in his castle near Starnberg, Bavaria. Through his mother, the archduchess Marie-Thérèse of Austria-Este, Prince Rupert was the descendant of the Stuart kings of England and, according to legitimist ideas, in the succession to the British crown.

RUPERT'S LAND, a former district of Canada. The generous charter of Charles II, given in 1670 to the Hudson's Bay company (*q.v.*), was interpreted to include all the country which was drained into Hudson bay. As Prince Rupert was first governor of the Hudson's Bay company his name was given to the concession under the name Rupert's Land. It must be observed that Athabasca, New Caledonia and British Columbia were not included in the grant. They were held under the title of Indian territories by the Hudson's Bay company by licence terminable every 21 years, the last term closing with 1859. Rupert's Land was transferred to Canada by the imperial government in 1870, and ceased to exist as a political name. It is still used as the title of the Anglican episcopal diocese, which is in the main coincident with the province of Manitoba; and as a provincial electoral district, where it applies to the far northern section of the province.

RUPILIUS, PUBLIUS, Roman statesman, consul in 132 B.C. During the inquiry that followed the death of Tiberius Gracchus, conducted by himself and his colleague Popilius Laenas, he proceeded with the utmost severity against the supporters of Gracchus. In the same year he was dispatched to Sicily, where he suppressed the revolt of the slaves under Eunus. During 131 he remained as proconsul of the island and, with the assistance of ten commissioners appointed by the senate, drew up regulations for the organization of Sicily as a province. These regulations were known by the title of *leges Rupiliæ*. Rupilius was subsequently brought to trial (123 B.C.) and condemned for his treatment of the friends of Gracchus. He died soon afterward.

RURAL DEPOPULATION. In all countries of the world during the first half of the 20th century there was a trend from the countryside toward the town; even in countries where the rural population was increasing, the urban population was increasing at a greater rate, so that practically everywhere the proportion of the rural to the total population was decreasing.

In the old world this tendency was very noticeable in Great Britain, where the rural population decreased not only relatively, but absolutely. In the new world, Australia showed the most striking drift from rural to urban districts; statistics showed that by mid-century about half of its population lived in the five capital cities, and only somewhat more than 20% could be classed as rural. This is an example of a new country, scarcely out of the agricultural stage of its development, with approximately the same apportionment of population as a long industrialized country, Great Britain.

It is extremely difficult to form an adequate picture of the true position, because of the different bases on which statistics are collected. In the United States the bureau of the census recorded for 1950 96,467,686 persons as urban, equivalent to 64% of the total for continental United States and 54,239,675 or 36% as rural. In contrast with the high figures of rural population, less than 10% of the working population of the country is engaged in agriculture. In Britain those who live in the administrative divisions known as rural districts are classed as rural and on this basis about 17% of the population are rural dwellers. According to the Scott report (Report of the Committee on Land Utilization in Rural Areas, cmd. 6378, 1943) the population of rural district areas of England and Wales was about 7,200,000 out of a total for the country of 41,215,000. But rural districts may include towns

with the maintenance and development of international trade. Between World Wars I and II there was a great growth both in house building by public authorities and in individual home ownership but owing to lack of foresight much land, especially good agricultural land, was wasted by sprawling urban growth and ribbon development along roads. At the same time almost 30% of the urban population of Britain was suffering from malnutritional diseases caused by a lack of fresh foods which could have been produced from the neglected agricultural land.

It is recognized that for a balanced national life land must be provided for industrial development, for adequate housing—the general desire in Britain is for individual homes with gardens—for a more adequate system of modern roads and facilities for air traffic, for open spaces for recreation. This still leaves the bulk of the land for agriculture and, other things being equal, the best land should be kept inviolate for food production and efficient farmers should enjoy security of tenure of good farm units.

The execution of a national policy of rural land use planning involved much careful study of the problems of rural depopulation. Following the proposals of L. D. Stamp it became usual to divide the rural population into three groups: (1) the primary rural population of farmers, farm workers, foresters and their dependents, (2) the secondary rural population of workers who are required to support the life of the first group; i.e., village storekeepers, garage men, schoolteachers, postal workers, doctors, veterinarians, religious leaders, produce brokers, etc., and (3) the adventitious rural population of those either active or retired who live in the country by choice. In areas scenically unattractive or difficult of access the third group may be completely absent. Where this is the case S. W. E. Vince showed that the primary rural population constitutes two-thirds of the whole. Even in the intensively farmed districts of central England the primary rural population may not reach 20 persons per square mile so that official policy came to encourage the adventitious population in order to maintain the social structure of rural life. Retired people of this group are often the most active in performing the innumerable functions of local administration.

In some countries much attention was paid to the introduction of alternative employment in country areas. Factories, especially those processing agricultural products, were introduced but experience showed their location in small towns is better than in villages or open country. Various forms of dual occupation exist. For example, fruit growers find it advantageous to locate their farms near towns where casual labour is available at the time of the fruit harvest. In Germany, Britain and elsewhere it has long been the custom for factory workers to rent a small piece of land or allotment for intensive cultivation in their spare time. In later industrial developments in Italy, the workers were encouraged to continue part-time farming. In New England farms which cannot support a full time farmer are kept in cultivation on a part-time basis by those whose first occupation is in industry. The realization that town and country are interdependent is so important that all such integrations are to be encouraged.

(L. D. S.)

UNITED STATES

After the 1840s urban population in the United States grew more rapidly than rural—rural population being defined approximately as that living outside cities and other incorporated places of 2,500 or more.

In 1790 almost 95% of the population of the United States was rural and even in 1850 the rural population formed 84.7% of the total. The rural percentage declined rather rapidly from this time on, however, being 71.8% in 1880; 60.3% in 1900; 48.8% for the first time less than half, in 1920; 43.5% in 1940; and 41.0% in 1950, using the same basis for classification as in the earlier years. Using a new definition set up in 1950, under which the rural area excludes all places of 2,500 or more and the urban fringe around the larger cities, the official figures for rural population showed an actual decline from 57,545,373 in 1940 to 54,229,675, or 36.0% of the total, in 1950. But this represented a change in the basis

of classification, not a real decline in rural population.

Nevertheless, while the rural population of the country as a whole continued to grow, there was local rural depopulation, in the strict sense of a decline in the number of persons living in rural areas. In 1920, for example, there were more than 1,000 counties, mainly rural counties, in which the census showed fewer inhabitants than in 1910. Many of these counties were in areas in which agriculture had been the principal occupation, and in which, because the land was not as good farm land as could be found elsewhere, one-time farms were being used only for pasture or even completely abandoned and permitted to revert to forest.

The acreage of land in farms continued to increase rapidly until about 1920, however; and after that date there was additional increase, or at least no appreciable decrease, either in total farm land or in the acreage of crops harvested. This means simply that agricultural activities had been transferred to areas with better soils or other advantages, or that, with increased use of farm machinery and better methods of farming, smaller numbers of workers had been necessary to operate the existing farms.

The definition of rural population, as used in the censuses of the various countries, may be such as to include considerable numbers of families having no connection whatever with farming. Because of this situation, provision was made in the 1920 census of the United States to subdivide the rural population into rural-farm, comprising only those families living on farms, and rural-nonfarm, made up largely of families living in villages and in the outskirts of cities. As an indication of the relation between agricultural activities and other economic activities, the rural-farm population figures are doubtless more significant than the total rural.

The rural-farm population of the United States numbered 31,393,262 (29.7% of the total) in 1920; 30,157,513 (24.6% of the total) in 1930; 30,216,188 (22.9% of the total) in 1940; and 23,048,350 (15.3% of the total) in 1950. The slight increase shown in 1940 was doubtless the result of the depression conditions which for the time being checked the urban trend; and the rapid decline during the subsequent decade in part made up for this temporary check, though there were unusually numerous and effective improvements in farming techniques during this period, almost forced upon farmers as a result of the high wages offered labour in war industries during World War II.

By way of justification for subdividing the rural classification, it may be noted that, in 1940, 78.5% of the workers in the rural-farm area were engaged in farm work, as compared with 6.9% of the rural-nonfarm workers (or 46.0% of the total rural workers), and 1.0% of the urban workers.

Reasons for the Changes.—The fundamental reason for the decline in the relative numbers of persons living in rural or farming areas lies in the fact that, with improvement in standard of living, the demand is for more manufactured products and more services, rather than for more farm products. The food requirements of 1,000,000 persons in 1950 were probably even less than the food requirements of the same number of persons 100 years earlier. But the nonfood items required for satisfactory living, even in the open country, were far and away greater in 1950 than the similar requirements in 1850. They include, to mention only a few, automobiles, radios and television, electric lights, hard-surface highways, sanitary plumbing, household machinery and mechanical refrigeration.

Meanwhile, the number of workers required to produce the nation's food requirements had been greatly reduced by the introduction of farm machinery (such as the tractor and the milking machine) and improved methods of farming, supplemented by new varieties of crops, improved breeds of livestock, and such incidental matters as hybrid corn (maize, not wheat) and more effective sprays and dusting materials for the control of insects and diseases.

And with greater specialization in farming, as in other industries, came an increasing production per worker. This was partly offset (as also in other lines of production) by the increased numbers of persons who must be employed in marketing and the physical dis-

tribution of the product. But these functions must be discharged largely in the cities and market towns, so that this type of employment, as well as the expanding of manufactures, contributes to the growth of the urban population, not the rural.

Tendencies and Prospects.—During the decade following 1940 the tendency among workers in the U.S. away from agricultural occupations (and especially toward trade and service occupations) was even more rapid than in earlier years. By way of background, figures are presented in Table I giving relative number of gainful workers ten years old and over in agricultural and nonagricultural occupations from 1920 to 1940 with 1950 estimates limited to employed civilian workers 14 years old and over distributed in the same way.

TABLE I.—*Gainful Workers in the United States Engaged in Agricultural and Nonagricultural Occupations: 1820-1950*

Census year	All occupations	Agricultural occupations		Nonagricultural occupations	
		Number	Per cent	Number	Per cent
1820	3,881,000	2,668,988	71.8	812,012	28.2
1830	3,031,537	2,777,453	70.5	1,159,084	38.3
1840	5,420,000	3,719,031	68.6	1,700,969	31.4
1850	7,097,198	4,901,864	69.2	2,195,334	30.8
1860	10,534,759	6,807,634	64.7	4,351,116	41.1
1870	14,924,951	8,549,772	57.3	6,075,179	40.6
1880	17,393,090	8,584,810	49.4	8,808,280	50.6
1890	23,188,181	9,038,378	39.0	14,149,803	61.0
1900	30,073,333	10,011,098	33.3	20,062,235	66.7
1910	37,370,704	11,591,787	31.0	25,778,917	69.0
1920	44,433,335	11,448,770	25.8	30,084,565	67.3
1930	48,889,070	10,471,008	21.4	38,557,992	78.6
1940	51,148,751	9,169,547	17.9	41,085,704	82.1
1950	58,668,000	7,195,000	12.3	51,473,000	87.7

The percentages for 1950 are reasonably comparable with those for earlier years, in spite of their narrower base, and indicate a decline in the relative importance of agricultural employment from 17.6% in 1940 to 12.2%, thus indicating the continuance of a series which began with 71.8% in 1820, and declined to 49.4% in 1880, to 27% in 1920, and to 21.4% in 1930.

This was the situation with regard to agricultural workers, who represent the core of the rural-farm population. (The urban-farm population, comprising persons living on farms in urban areas, is negligible, numbering usually no more than 300,000.)

On the other hand, the percentage of all farm-resident members of the labour force who were engaged in agriculture was lower in 1950 than earlier, being only about 70, as compared with 78.5 in 1940. This might indicate the inclusion of larger numbers of farm families for whom the farm was primarily a place of residence, rather than a source of primary income, though special effort was made in the 1950 census to exclude from the farm-population classification those families who occupied homes physically located on a farm but had no real connection with agricultural activities.

The fundamental factors named above as responsible for the historical decline in the percentage of the population of the U.S. living in rural areas would seem to be in full operation. The proportion of city-produced goods required to support further improvements in the standard of living might well continue its rapid growth, as against very small increases in the per capita demand for farm products; and there would certainly be further improvements in the techniques of agriculture. True, the 1950 estimates indicated some increase in the numbers of workers living on farms and working elsewhere; but this certainly did not foreshadow any strong tendency toward rural or farm residence for urban workers. The tendency had been toward specialization and mechanization, even in agriculture; and this tendency was not at all consistent with the relatively inefficient production of subsistence or part-time farming.

RURAL EDUCATION. "Learn by doing." This well-worn phrase, so applicable to education in all its phases, applies with redoubled force to rural education, both with respect to the teacher and the taught. The curriculum of the rural primary school, while consistent with that of the town school in some respects, must be based very largely upon environment. For this purpose the basic subject would appear to be nature study. In rural areas the pupils are in the midst of nature's great laboratory, and have all necessary material at hand. A systematic study of nature will inculcate the habit of observation and the

pupils will be trained to think and to inquire. Consequently, by the time the pupils reach the age of 11+ years, they should be well grounded in the subjects of the primary school curriculum—reading, writing and arithmetic—and should be interested in and observant of their environment, and be ready to study more systematically the applications of their observations.

The problem then arises as to the course to be followed in the central schools or senior classes. Here "the treatment of the various subjects of the curriculum should respond sympathetically to the local environment." It is necessary that the pupils be encouraged to take an interest in local industries and occupations and for this purpose the teacher must continuously draw illustrations from local examples. For boys, nature study should

develop into rural science. For them there should be systematic instruction in the physics and chemistry of soils, manures, plant and vegetable life, taken in connection with gardening and rural carpentry. Girls should be provided with instruction in cookery, laundry and general housewifery. Their instruction in domestic science must be correlated with local conditions, and they should be taught to manage the domestic side of homes such as they are likely to meet with in rural areas.

The problem of the curriculum for children of 11+ years is considerably more difficult in rural areas. The scattered character of the population, the difficulty of communication and the persistent parochial idea with regard to education, all render the task of the organization of central schools more difficult for those who do not go on to a secondary school. In some areas, the village school must always remain the unit and post-primary education must be provided in the primary school by means of a special curriculum such as that outlined for the top classes. Where a number of schools are sufficiently near one another and the accommodation admits, senior classes can be collected in one building, where the number in the age groups of the post-primary pupils will be sufficiently large to justify a separate teacher and the instruction should be to that extent the better.

As has been experienced in a large rural area, central schools can be established. Although generally they will be non-selective central schools, yet a selective central school here and there can with great advantage be established. Although selective central schools are not to be regarded as in any sense competitors of the present day secondary schools, yet such schools provide facilities for those of the primary school who are unable to find accommodation in the secondary schools and who need a secondary education of the more practical character. Education should be viewed as an "organic whole."

The majority of central schools established in a rural area will probably be of the nonselective type. Where such schools are established, there should be separate rooms for practical work for both boys and girls. There especially, it is necessary that the pupils should learn by doing, and in order to carry out this to the full, the teachers must be trained upon similar lines. There will probably always be rural schools and good teachers are as essential there as in town schools; and in the case of a rural teacher, knowledge of country life and occupations would appear to be a *sine qua non*. Such teachers are generally those who have spent the early part of their training at least in country schools. Consequently it would appear necessary to retain to a limited extent, albeit in a somewhat modified form, the rural pupil teacher system. When framing the syllabus of work to be done in colleges for the training of teachers, provision should be made for those teachers interested and experienced in country life and occupations by the introduction of special courses whereby that interest may be fostered, and that experience enlarged. However trained, the rural teacher must be interested in rural life, and the

education given in rural schools must be thoroughly practical in all its aims and aspects and in every sense consistent with the environment.

BIBLIOGRAPHY.—*The New Prospect in Education*, Board of Education, Educational pamphlets, no. 60; H. Morris, *The Village College* (1924); *Report of the Departmental Committee on the Training of the Rural Teacher* (appointed 1927). (J. S. D.)

THE UNITED STATES

Rural education refers to the schools centered about rural communities varying in population from a few families to 2,500 people. Before the development of the consolidated schools rural education was limited to the elementary school which was housed in a one or two-room building. With the appearance of the union and consolidated districts rural education included all schools below college grade. The rural schools range in size from the one-teacher elementary school to the consolidated school which often includes both elementary and high school with several teachers. There are at least three distinct types of rural school organization: (1) the local district which includes usually a one or two-teacher school; (2) the consolidated district which is a union of two or more local districts, and (3) the county district which is the largest unit of rural school organization. In several of the states the township is the local school unit.

Since rural children live in a different environment from urban children, rural education attempts to utilize the materials of that environment. This does not mean that there is a fundamental difference in the ultimate aims of rural and urban education. Both types of school are attempting to provide conditions that will enable the children of each to meet effectively the problems of life. Rural education, like urban education, is utilizing materials from all sources which will enrich the experience of the individual, enabling him to seek new levels of achievement. The function of the rural school is not confined to the preparation of boys and girls to be farmers. While provision is made for training in this field and its related activities, provision is also made for those rural children who are planning on other lines of work than agriculture. Better rural schools are offering several curricula and are not limiting their work to one highly specialized curriculum.

Changing conditions in rural U.S. demand that the educational facilities of the rural school must be equal to those of the urban school.

The rural child, like the urban, is a potential member of the social, economic and political democracy. In many rural communities efforts are being made to apply all known means of improving the schools, such as modern buildings and equipment, scientific curricula and methods of teaching, effective supervision and professionally trained teachers. Every method that has proved effective in improving the urban schools is being applied to the rural schools with the necessary modifications to meet the needs of the rural people.

The U.S. office of education reported that in 1947, 81% of the schools in the United States were in rural areas, and 51% of the teachers taught in rural communities. Of the children between 5 and 17 years of age, 51% were living in rural areas, and 47% of the students attending public schools were enrolled in rural schools.

The one-teacher schools declined from 78% of all schools in 1917-18 to 44% in 1947-48. (W. D. A.; X.)

RURKI: see ROORKEE.

RUSCHUK (Bulg. *Russé*), the capital of the department of Ruschuk, Bulgaria, on the right bank of the Danube, where it receives the R. Lom. Pop. (1946) 53,420. It is connected by rail with Varna and Sofia; by boat and rail with Bucharast. It is the chief Danubian port of Bulgaria, and an important commercial centre.

It possesses sugar, tobacco and cigarette factories, soapworks, breweries, aerated water factories, dyeworks, tanneries, sawmills, brick and tile works and a celebrated pottery.

In Roman times Ruschuk was one of the fortified points along the line of the Danube. In the *Tabula Peutingeriana* it appears as Prisca, in the *Antonine Itinerary* as Serantaprista, in the *Notitia*

as Seragintaprista and in Ptolemy as Priste Polis. Destroyed by barbarian invaders in the 7th century the town recovered its importance only in comparatively modern times. It played an important part in the Russo-Turkish wars of 1810, 1828-29, 1853-54 and 1877-78. In 1877 it was nearly destroyed by Russian artillery.

RUSELLAE, an ancient town of Etruria, Italy, about 10 mi. S.E. of Vetulonia and 5 mi. N.E. of Grosseto, situated on a hill with two summits, the higher 636 ft. above sea level. It was one of the twelve cities of the Etruscan confederation, and was taken in 294 B.C. by the Romans. In 205 B.C. it contributed grain and timber for the needs of Scipio's fleet. The place was deserted in 1138, and the episcopal see was transferred to Grosseto. The walls, nearly 2 mi. in circumference, are in places well preserved. They consist of large unworked blocks of a travertine which naturally splits into roughly rectangular blocks; these are quite irregular, and often as much as 9 ft. long by 4 ft. wide; in the interstices smaller pieces are inserted.

RUSH, BENJAMIN (1745-1813), U.S. physician, was born in Byberry township, near Philadelphia, Pa. In 1760 he graduated at Princeton university. In 1768 he took his M.D. at Edinburgh, and after spending a year in the hospitals of London and Paris began practice in Philadelphia. In 1774 he founded with James Pemberton the first antislavery society in America. In 1776, as a member of congress for the state of Pennsylvania, he was one of those who signed the Declaration of Independence. In 1787 he was a member of the Pennsylvania convention which adopted the federal constitution. He became professor of the institutes of medicine and of clinical practice, succeeding in 1796 to the chair of the theory and practice of medicine, at the University of Pennsylvania. He engaged in epidemiological work and was actively interested in the investigation of yellow fever. In 1799 he was appointed treasurer of the U.S. mint in Philadelphia. He died in Philadelphia on April 19, 1813, after a five days' illness from typhus fever.

Rush's writings covered an immense range of subjects. His last work was an elaborate treatise on the *Diseases of the Mind* (1812). He is best known by the five volumes of *Medical Inquiries and Observations*, which he brought out at intervals from 1789 to 1798.

RUSH, RICHARD (1780-1859), American statesman and diplomat, son of Dr. Benjamin Rush, was born in Philadelphia, Pa., on Aug. 29, 1780. He graduated at Princeton in 1797, and was admitted to the bar in 1800. He was attorney-general of Pennsylvania in 1811; controller of the Treasury of the United States, 1811-14; attorney general in the cabinet of President James Madison, 1814-17; acting secretary of State from March to Sept., 1817; minister to Great Britain, 1817-25; secretary of the treasury in the cabinet of President J. Q. Adams, 1825-29; and candidate for vice-president on the Adams ticket in 1828. In 1818, while minister to Great Britain, he, in association with Albert Gallatin, concluded with British plenipotentiaries the important treaty which determined the boundary line between the United States and Canada from the Lake of the Woods to the Rocky mountains and provided for the joint occupation of Oregon for ten years. He also conducted the negotiations with Canning in 1823 relating to the South American policy of the Holy Alliance.

He followed the Adams-Clay faction of the Democratic-Republican party in the split of 1825-28, but returned to the Democratic party about 1834 on the bank issue. In 1835 he and Benjamin C. Howard, of Baltimore, Md., were sent by President Jackson to prevent an outbreak of hostilities in the Ohio-Michigan boundary dispute. In 1836-38 Rush was commissioner to receive the Smithsonian legacy (see SMITHSONIAN INSTITUTION), and in 1847-49 he was minister to France. He died in Philadelphia on July 30, 1859.

He published *A Narrative of a Residence at the Court of London from 1817 to 1825* (2 vols. 1833-45; all editions after the 1st ed. of the 1st vol. are entitled *Memoranda of a Residence, etc.*); *Washington in Domestic Life* (1857), compiled from letters written by Washington to his private secretary in 1790-98; and *Occasional Productions, Political, Diplomatic and Miscellaneous*

(1860); and while attorney-general he suggested the plan for the compilation, *Laws of the Nation* (5 vols., 1815), ed. by John B. Colvin.

RUSH. Under the name of rush or rushes, the stalks or hollow stem-like leaves of several plants have minor industrial applications. The common rushes (species of *Juncus*; see JUNCACEAE) are used in many parts of the world for chair bottoms, mats and basketwork, and the pith serves as wicks in open oil lamps and for tallow candles—whence rushlight. The fibrous stems and leaves of the bulrush, reed mace or cattail, *Typha angustifolia*, are used in north India for ropes, mats and baskets. *Scirpus* and other Cyperaceae are used for chair bottoms, mats and thatch; the rush mats of Madras are made from a species of *Cyperus*. The sweet rush, yielding essential oil, is a grass, *Cymbopogon citratus*, known also as lemon grass. Quantities of the horse-tail, *Equisetum hyemale*, are used under the name of Dutch or scouring rush for scouring metal and other hard surfaces on account of the large proportion of silica the plant contains. Flowering rush is *Butomus umbellatus* (see ALISMATACEAE); wood rush is the common name for *Luzula* (see JUNCACEAE).

Acorus calamus (family Araceae), sweet flag, is also known as sweet rush.

RUSHDEN, urban district, in the Wellingborough parliamentary division, Northamptonshire, Eng., 66 mi. N.W. from London by the London Midland Region railway route. Area 6 sq.mi.; pop. (1951) 16,321. The church of St. Mary, a cruciform building, is mainly Decorated with Perpendicular additions, but retains some Early English details. The population is employed in boot- and shoemaking. The town is now almost continuous with Higham Ferrers.

RUSHDI PASHA (c. 1864-1928), Egyptian statesman, was born about 1864, and educated in France. On his return to Egypt he entered the government service, becoming a minister in 1908. In April 1914 he was made prime minister, and at the outbreak of World War I he was acting as regent in the absence of the khedive. The fact that Egypt was still technically part of the Ottoman empire and that Turkey at first declared for neutrality made his position extremely difficult. He had, however, a strong cabinet and when Turkey entered the war on the side of Germany he agreed to the proclamation of a British protectorate.

After the armistice Rushdi pressed the British government for a definition of Egypt's position and asked to be received in London to discuss the question. This proposal was not accepted, and on March 1, 1919, he and his cabinet resigned. A few days later Zaghlul Pasha was arrested by the British authorities and deported to Malta. This step led to serious rioting, and he was soon released and continued his journey to Paris to champion Egypt at the peace conference. The British government had to appeal once more to Rushdi Pasha, who consented, after the release of Zaghlul, to form a ministry again. The treatment which he had received had, however, greatly diminished his prestige, and he was obliged to resign again ten days later. He retired into private life, and did not take office again until the Milner commission (1919) had made its report.

An Egyptian cabinet was required which should have sufficient support in Egypt to undertake negotiations in London toward an agreed settlement. Adly Pasha was made prime minister, and Rushdi became president of the council, being chosen to accompany him to England. He was, however, failing in health, and he died on March 13, 1928.

RUSHMORE, MOUNT, MEMORIAL: see BORGNUM, GUTZON.

RUSHVILLE, a city of Indiana, U.S., 39 mi. S.E. of Indianapolis, on Flat Rock creek, at an altitude of 967 ft.; the county seat of Rush county. It is on federal highway 52 and is served by the Baltimore and Ohio, the New York Central, the Erie, the Nickel Plate and the Pennsylvania railways.

The population in 1930 was 6,761 and it was 5,960 in 1940 by the federal census. It has various manufacturing industries and a large trade in grain and livestock (especially blooded hogs), and lumber. Rushville was chartered as a town in 1816 and as a city in 1883.

RUSHWORTH, JOHN (c. 1612-1690), the compiler of the *Historical Collections* commonly described by his name, was the son of Lawrence Rushworth of Acklington Park, Warkworth, Northumberland. In 1638 he was appointed solicitor to the town of Berwick. He was enrolled in Lincoln's Inn in 1647, and was called to the bar in 1647. He attended all public occasions of a political and judicial character, such as proceedings before the Star chamber or the council, and made shorthand notes of them. On April 25, 1640, he was appointed an assistant clerk to the house of commons. He became secretary to Fairfax, and then, for a short time, to Cromwell. He was afterward employed by the council of state and during the protectorate, and sat in Cromwell's parliament for Berwick.

He made his peace with the government of Charles II, and though he was threatened with trial as a regicide he was not seriously molested. During the reign of Charles II he continued to act as agent for the town of Berwick, and he sat for it in parliament. He was also for a time agent for Massachusetts. From 1684 till his death on May 12, 1690, he was a resident in the King's bench prison. At this time he had destroyed his memory by overindulgence in drink.

The collection of papers which he made was published in eight volumes folio between 1659 and 1701. The volumes from the fourth onward appeared after his death.

RUSKIN, JOHN (1819-1900), English writer and critic, was born in London, at Hunter street, Brunswick square, on Feb. 8, 1819, being the only child of John James Ruskin and Margaret Cox. They were Scots, first cousins, the grandchildren of a certain John Ruskin of Edinburgh (1732-1780). John Ruskin, the author's grandfather, was a wine merchant in Edinburgh, who ran through his fortune, and ended his days in debt. His son, John James Ruskin (1785-1864), father of the author, was sent, on leaving Edinburgh High School, to London to enter the wine trade. There, in 1809, he founded the sherry business of Ruskin, Telford and Domecq; Domecq being proprietor of a famous vineyard in Spain, Telford contributing the capital of the firm, and Ruskin having sole control of the business. Ruskin built up a great business, paid off his father's debts and formed near London a most hospitable and cultured home, where he maintained his taste for literature and art.

Margaret Ruskin, the author's mother, was a handsome, strong, stern, able, devoted woman of the old Puritan school, Calvinist in religion, unsparing of herself and others, rigid in her ideas of duty, proud, reserved and ungracious. The child was brought up under a rigid system of nursing, physical, moral and intellectual; kept without toys, not seldom whipped, watched day and night, but trained from infancy in music, drawing, reading aloud and observation of natural objects. When he was four the family removed to a house on Herne Hill, then a country village, with a garden and rural surroundings. The father, who made long tours on business, took his wife, child and nurse year after year across England as far as Cumberland and Scotland, visiting towns, cathedrals, castles, colleges, parks, mountains and lakes. At 14 the child was taken through Flanders, along the Rhine, and through the Black Forest to Switzerland, where he first imbibed his dominant passion for the Alps. His youth was largely passed in systematic travelling in search of everything beautiful in nature or in art. And to one so precocious, stimulated by a parent of much culture, ample means and great ambition, this resulted in an almost unexampled aesthetic education. In childhood also he began a systematic practice of composition, both in prose and verse. His mother trained him in reading the Bible, of which he read through every chapter of every book year by year; and to this study he justly attributes his early command of language and his pure sense of style. His father read to him Shakespeare, Scott, Don Quixote, Pope and Byron, and most of the great English classics; and his attention was especially turned to the formation of sentences and to the rhythm of prose. He began to compose both in prose and verse as soon as he had learned to read and write, both of which arts he taught himself by the eye. He wrote enormous quantities of verse, and began dramas, romances and imitations of Byron, Pope, Scott and Shelley.

His schooling was irregular and not successful. At 15 he was sent for two years to the day-school of the Rev. T. Dale of Peckham, and at 17 he attended some courses in literature at King's college, London. In painting he had lessons from Copley Fielding and afterwards from J. D. Harding. But in the incessant travelling, drawing, collecting specimens and composition in prose and verse he had gained but a very moderate classical and mathematical knowledge when he matriculated at Oxford; nor could he ever learn to write tolerable Latin. As a boy he was active, lively and docile; a good walker, but ignorant of all boyish games, as naive and as innocent as a child; and he never could learn to dance or to ride. He was only saved by his intellect and his fine nature from turning out an arrant prig. He was regarded by his parents, and seems to have regarded himself, as a genius.

At the age of 17 he saw Adèle, the French daughter of Monsieur Domecq, Mr. Ruskin's partner, a lovely girl of fifteen. John fell rapturously in love with her; and, it seems, the two fathers seriously contemplated their marriage. The young poet wooed the girl with poems, romances, dramas and mute worship, but received nothing except chilling indifference and lively ridicule. To the gay youth beauty, familiar with Parisian society, the raw and serious youth was not a possible *part*. She was sent to an English school, and he occasionally saw her. His unspoken passion lasted about three years, when she married the Baron Duquesne. Writing as an old man, long after her death, Ruskin speaks of his early love without any sort of rapture. But it is clear that it deeply coloured his life, and led to the illness which for some two years interrupted his studies and made him a wanderer over Europe.

As the father was resolved that John should have everything that money and pains could give, and should one day be a bishop at least, he entered him at Christ Church, Oxford, as a gentleman-commoner—then an order reserved for men of wealth and rank. Ruskin's Oxford career, broken by the two years passed abroad, was not very full of incident or of usefulness. Both he and his college took kindly the amazing proceeding of his mother, who left her husband and her home to reside in Oxford, that she might watch over her son's health. The one success of his Oxford career was the winning the Newdigate Prize by his poem "Salsette and Elephanta," which he recited in the Sheldonian Theatre (June 1839). Two years of ill-health and absence from home ensued. And he did not become "a Graduate of Oxford" until 1842, in his 24th year, five years after his first entrance at the university. In fact, his desultory school and college life had been little more than an interruption and hindrance to his real education—the study of nature, of art and of literature. Long before Ruskin published books he had written for various periodicals on architectural and other subjects.

After leaving Oxford, Ruskin set to work steadily at Herne Hill on the more elaborate defence of Turner, which was to become his first work. *Modern Painters*, vol. I, by "a Graduate of Oxford," was published May 1843, when the author was little more than twenty-four. It was vehemently attacked by the critics, and coolly received by the painters. Even Turner was somewhat disconcerted; but the painter was now known to both Ruskins, and they freely bought his pictures. The family then went again to the Alps, that John might study mountain formation and "Truth" in landscape. In 1845 he was again abroad in Italy, working on his *Modern Painters*, the second volume of which appeared in 1846. He had now plunged into the study of Bellini and the Venetian school, Fra Angelico and the early Tuscans, and he visited Lucca, Pisa, Florence, Padua, Verona and Venice, passionately devoting himself to architecture, sculpture and painting in each city of north Italy. He wrote a few essays for the *Quarterly Review* and other periodicals, and in 1849 (*aet.* 30) he published *The Seven Lamps of Architecture*, with his own etchings, which greatly increased the reputation acquired by his *Modern Painters*.

On April 10, 1848, a day famous in the history of Chartism, Ruskin was married at Perth to Euphemia Chalmers Gray, a lady of great beauty, of a family long intimate with the Ruskins. The marriage, we are told, was arranged by the parents of the pair, and was a somewhat hurried act. It was evidently ill-assorted, and brought no happiness to either. They travelled, lived in Lon-

dun, saw society, and attended a "Drawing-room" at Buckingham Palace. But Ruskin, immersed in various studies and projects, was no husband for a brilliant woman devoted to society. No particulars of their life have been made public. In 1854 his wife left him, obtained a nullification of the marriage under Scots law, and ultimately became the wife of John Everett Millais. John Ruskin returned to his parents, with whom he resided till their death; and neither his marriage nor the annulling of it seems to have affected seriously his literary career.

Ruskin's architectural studies, of which *The Seven Lamps* was the first fruit, turned him from Turner and *Modern Painters*. He planned a book about Venice in 1845, and *The Stones of Venice* was announced in 1849 as in preparation. After intense study in Italy and at home, early in 1851 (the year of the Great Exhibition in London) the first volume of *The Stones of Venice* appeared (*aet.* 32). It was a concrete expansion of the ideas of *The Seven Lamps*—that the buildings and art of a people are the expression of their religion, their morality, their national aspirations and social habits. It was, as Carlyle wrote to the author, "a sermon in stones," "a singular sign of the times," "a new Renaissance." It appeared in the same year with *The Construction of Sheepfold*—a plea for the reunion of Christian churches—in the same year with the essay on *Pre-Raphaelitism*, the year of Turner's death (19th December). *The Stones of Venice* was illustrated with engravings by some of the most refined artists of his time. The author spent a world of pains in having these brought up to the highest perfection of the reproductive art, and began the system of exquisite illustration, and those facsimiles of his own and other sketches, which make his works rank so high in the catalogues and price-lists of collectors. This delicate art was carried even farther in the later volumes of *Modern Painters* by the school of engravers whom Ruskin inspired and gathered round him. And these now rare and coveted pieces remain to rebuke us for our modern preference for the mechanical and unnatural *chiaroscuro* of photography—the successor and destroyer of the graver's art.

Although Ruskin was practised in drawing from the time that he could hold a pencil, and had lessons in painting from some eminent artists, he at no time attempted to paint pictures. He said himself that he was unable to compose a picture, and he never sought to produce anything that he would call a work of original art. His drawings, of which he produced an enormous quantity, were always intended by himself to be studies or memoranda of buildings or natural objects precisely as they appeared to his eye. Clouds, mountains, landscapes, towers, churches, trees, flowers and herbs were drawn with wonderful precision, minuteness of detail and delicacy of hand, solely to recall some specific aspect of nature or art, of which he wished to retain a record. In his gift for recording the most subtle characters of architectural carvings and details, Ruskin has hardly been surpassed by the most distinguished painters.

In 1853 *The Stones of Venice* was completed at Herne Hill, and he began a series of *Letters and Notes* on pictures and architecture. In this year (*aet.* 34) he opened the long series of public lectures wherein he came forward as an oral teacher and preacher, not a little to the alarm of his parents and amidst a storm of controversy. The Edinburgh Lectures (November 1853) treated Architecture, Turner and Pre-Raphaelitism. The Manchester Lectures (July 1857) treated the moral and social uses of art, now embodied in *A Joy for Ever*. Some other lectures are reprinted in *On the Old Road and The Two Paths* (1859). These lectures did not prevent the issue of various *Notes* on the Royal Academy pictures and the Turner collections; works on the *Harbours of England* (1856); on the *Elements of Drawing* (1857); the *Elements of Perspective* (1859). At last, after prolonged labour, the fifth and final volume of *Modern Painters* was published in 1860 (*aet.* 41). This marks an epoch in the career of John Ruskin; and the year 1860 closed the series of his works on art strictly so called.

The last forty years of his life were devoted to expounding his views, or rather his doctrines, on social and industrial problems, on education, morals and religion, wherein art becomes an incidental and instrumental means to a higher and more spiritual life.

And his teaching was embodied in an enormous series of lectures, letters, articles, selections and serial pamphlets. These are now collected in upwards of thirty volumes in the final edition. The entire set of Ruskin's publications amounts to more than fifty works having distinctive titles. For some years before 1860 Ruskin had been deeply stirred by reflecting on the condition of all industrial work and the evils of modern society. His lectures on art had dealt bitterly with the mode in which buildings and other works were produced. In 1854 he joined F. D. Maurice, T. Hughes and several of the new school of painters, in teaching classes at the Working Men's College. But it was not until 1860 that he definitely began to propound a new social scheme, denouncing the dogmas of political economy. Four lectures on this topic appeared in the *Cornhill Magazine* until the public disapproval led the editor, then W. M. Thackeray, to close the series. They were published in 1862 as *Unto this Last*. In the same year he wrote four papers in the same sense in *Fraser's Magazine*, then edited by J. A. Froude; but he in turn was compelled to suspend the issue. They were completed and ultimately issued under the title *Munera Pulveris*. These two small books contain the earliest and most systematic of all Ruskin's efforts to depict a new social Utopia. They contain a vehement repudiation of the orthodox formulas of the economists; and they are for the most part written in a trenchant but simple style, in striking contrast to the florid and discursive form of his works on art.

In 1864 Ruskin's father died, at the age of 79, leaving his son a large fortune and a fine property at Denmark Hill. John still lived there with his mother, aged 83, infirm, and failing in sight, to whom came as a companion his cousin, Joanna Ruskin Agnew, afterwards Mrs. Arthur Severn. At the end of the year 1864 Ruskin delivered at Manchester a new series of lectures—not on art, but on reading, education, woman's work and social morals—the expansion of his earlier treatises on economic sophisms. This afterwards was included with a Dublin lecture of 1868 under the fantastic title of *Sesame and Lilies* (perhaps the most popular of his social essays), of which 44,000 copies were issued down to 1900. He made this, in 1871, the first volume of his collected lectures and essays, the more popular and didactic form of his new Utopia of human life. It contains, with *Fors*, the most complete sketch of his conception of the place of woman in modern society.

In the very characteristic preface to the new edition of 1871 Ruskin proposes never to reprint his earlier works on art; disclaims many of the views they contained, and much in their literary form; and specially regrets the narrow Protestantism by which they were pervaded. In the year 1866 he published a little book about girls, and written for girls, a mixture of morals, theology, economics and geology, under the title of *Ethics of the Dust*; and this was followed by a more important and popular work, *The Crown of Wild Olive*. This in its ultimate form contained lectures on "Work," "Traffic," "War" and "The Future of England." It was one of his most trenchant utterances, full of fancy, wit, eloquence and elevated thought. But a more serious volume was *Time and Tide* (1867), a series of twenty-five letters to a workman of Sunderland, upon various points in the Ruskinian Utopia. This little collection of "Thoughts," written with wonderful vivacity, ingenuity and fervour, is the best summary of the author's social and economic programme, and contains some of his wisest and finest thoughts in the purest and most masculine English that he had at his command. In 1869 he issued *The Queen of the Air*, lectures on Greek myths, a subject he now took up, with some aid from the late Sir C. Newton. It was followed by some other occasional pieces; and in the same year he was elected Slade professor of art in the University of Oxford.

He now entered on his professional career, which continued with some intervals down to 1884, and occupied a large part of his energies. His lectures began in February 1870, and were so crowded that they had to be given in the Sheldonian Theatre, and frequently were repeated to a second audience. He was made honorary fellow of Corpus Christi, and occupied rooms in the college. In 1871 his mother died, at the age of 90, and his cousin, Miss Agnew, married Arthur Severn. In that year he bought from Linton, Brantwood, an old cottage and property on Conistow Lake,

a lovely spot facing the mountain named the Old Man. He added greatly to the house and property, and lived in it continuously until his death in 1900. In 1871, of the most eventful years of his life, he began *Fors Clavigera*, a small serial addressed to the working men of England, and published only by George Allen, engraver, at Keston, in Kent, at 7d., and afterwards at 10d., but without discount, and not through the trade. This was a medley of social, moral and religious reflections interspersed with casual thoughts about persons, events and art. *Fors* means alternatively fate, force or chance, bearing the *Clavis*, club, key or nail, i.e., power, patience and law. It was a desultory exposition of the Ruskinian ideal of life, manners and society, full of wit, play, invective and sermons on things in general. It was continued with intervals down to 1884, and contained ninety-six letters or pamphlets, partly illustrated, which originally filled eight volumes and are now reduced to four.

The early years of his Oxford professorship were occupied by severe labour, sundry travels, attacks of illness and another cruel disappointment in love. In spite of this, he lectured, founded a museum of art, to which he gave pictures and drawings and £5,000; he sought to form at Oxford a school of drawing; he started a model shop for the sale of tea, and model lodgings in Marylebone for poor tenants. At Oxford he set his pupils to work on making roads to improve the country. He now founded "St. George's Guild," himself contributing £7,000, the object of which was to form a model industrial and social movement, to buy lands, mills and factories, and to start a model industry on co-operative or Socialist lines. In connection with this was a museum for the study of art and science at Sheffield. Ruskin himself endowed the museum with works of art and money; a full account of it has been given in E. T. Cook's *Studies in Ruskin* (1890), which contains the particulars of his university lectures and of his economic and social experiments. It is unnecessary to follow out the history of these somewhat unpromising attempts. None of them came to much good, except the Sheffield museum, which is an established success, and is now transferred to the town.

In *Fors*, which was continued month by month for seven years, Ruskin poured out his thoughts, proposals and rebukes on society and persons with inexhaustible fancy, wit, eloquence and freedom, until he was attacked with a violent brain malady in the spring of 1878 (*æet.* 59); and, although he recovered in a few months sufficiently to do some occasional work, he resigned his professorship early in 1879. The next three years he spent at Brantwood, mainly in retirement, and unhappy in finding nearly all his labours interrupted by his broken health. In 1880 he was able to travel in northern France, and began the *Bible of Amiens*, finished in 1885; and he issued occasional numbers of *Fors*, the last of which appeared at Christmas 1884. In 1882 he had another serious illness, with inflammation of the brain; but he recovered sufficiently to travel to his old haunts in France and Italy—his last visit. And in the following year he was re-elected professor at Oxford and resumed his lectures, but increasing brain excitement, and indignation at the establishment of a laboratory to which vivisection was admitted, led him to resign his Oxford career, and he retired in 1884 to Brantwood, which he never left. He now suffered from frequent attacks of brain irritation and exhaustion, and had many causes of sorrow and disappointment. His lectures were published at intervals from 1870 to 1885 in *Aratra Pentelici*, *The Eagle's Nest*, *Love's Meinie*, *Ariadne Florentina*, *Val d'Arno*, *Proserpina*, *Deucalion*, *The Laws of Fesolè*, *The Bible of Amiens*, *The Art of England* and *The Pleasures of England*, together with a series of pamphlets, letters, articles, notes, catalogues and circulars.

In the retirement of Brantwood he began his last work, *Proserpina*, a desultory autobiography with personal anecdotes and reminiscences. He was again attacked with the same mental malady in 1885, which henceforth left him fit only for occasional letters and notes. In 1887 it was found that he had exhausted (spent, and given away) the whole of the fortune he had received from his father, amounting, it is said, to something like £200,000; and he was dependent on the vast and increasing sale of his works, which produced an average income of £4,000 a year, and at times

on the sale of his pictures and realizable property. In 1872 a correspondent had remonstrated with him in vain as to taking "usury," i.e., interest on capital lent to others for use. In 1874 Ruskin himself had begun to doubt its lawfulness. In 1876 he fiercely assailed the practice of receiving interest or rent, and he henceforth lived on his capital, which he gave freely to friends, dependants, public societies, charitable and social objects. The course of his opinions and his practice is fully explained in successive letters in *Fors*.

Until 1839 Ruskin continued to write chapters of *Præterita*, which was designed to record memories of his life down to the year 1875 (*aet.* 56). It was, in fact, only completed in regular series down to 1858 (*aet.* 39), with a separate chapter as to Mrs. Arthur Severn, and a fragment called *Dilecta*, containing letters and early recollections of friends, especially of Turner. These two books were published between 1885 and 1889; and except for occasional letters, notes and prefaces, they form the last writings of the author of *Modern Painters*. His literary career thus extends over fifty years. But he has left nothing more graceful, naive and pathetic than his early memories in *Præterita*—a book which must rank with the most famous "Confessions" in any literature. The last ten years of his life were passed in complete retirement at Brantwood, in the loving care of the Severn family, to whom the estate was transferred, with occasional visits from friends, but with no sustained work beyond correspondence, the revision of his works, and a few notes and prefatory words to the books of others. He wished to withdraw his early art writings from circulation, but the public demand made this practically impossible.

The close of his life was one of entire peace and honour. He was loaded with the degrees of the universities and membership in numerous societies and academies. "Ruskin Societies" were founded in many parts of the kingdom. His works were translated and read abroad, and had an enormous circulation in Great Britain and the United States. He died suddenly after only two days' illness on Jan. 20, 1900. He was buried in Coniston churchyard by his own express wish, the family refusing the offer of a grave in Westminster Abbey.

Ruskin's life and writings have been the subject of many works composed by friends, disciples and admirers. The principal is the *Life*, by W. G. Collingwood, his friend, neighbour and secretary (2 vols., 1893, and ed., 1900). His pupil, E. T. Cook, published his *Studies in Ruskin* in 1890, with full details of his career as professor, and a *Life of Ruskin* in 1911. J. A. Hobson, in *John Ruskin, Social Reformer* (2nd ed., 1890), has elaborately discussed his social and economic teaching, and claims him as "the greatest social teacher of his age." An analysis of his works has been written by Mrs. Meynell (1900). His art theories have been discussed by Professor Charles Waldstein of Cambridge in *The Work of John Ruskin* (1894), by Robert de la Sizeranne in *Ruskin et la religion de la beauté* (1897), and by Professor H. J. Brunhes of Fribourg in *Ruskin et la Bible* (1902). The monumental "library edition" of Ruskin's works (39 vols., 1903–12), prepared by E. T. Cook, with A. Wedderburn, is the greatest of all the tributes of literary admiration. See also *Century Addresses* (1919) ed. J. H. Whitehouse; J. R. Morley, *John Ruskin and Social Ethics* (1917); A. Williams-Ellis, *The Tragedy of John Ruskin* (1928).

(F. HAR.)

RUSSELL (FAMILY). The great English Whig house of the Russells, earls and dukes of Bedford, rose under the favour of Henry VIII. Obscure genealogists have traced their lineage from "Hugh de Rozei," alias "Hugh Bertrand, lord of le Rozei," a companion of the Conqueror, peddling their fiction with the pedigree of certain Russells who are found holding Kingston Russell in Dorset as early as the reign of King John. But the first undoubted ancestor of the Bedford line is Henry Russell, a Weymouth merchant, returned as a Burgess for that borough in four parliaments between 1425 and 1442. He may well have been the son of Stephen Russell, another Weymouth merchant, whose name is just before his in the list of those men of substance in Dorsetshire who, in 1434, under the act of parliament, were to be sworn not to maintain breakers of the peace. Stephen Russell, having served the office of bailiff of Weymouth, was returned as Burgess to the parliament of 1395, and one William Russell was returned for King's Melcombe in 1340. Both Stephen and Henry were in the wine trade with Bordeaux, and in 1427 Henry

Russell was deputy to the chief butler of England for the port of Melcombe. In 1442 a pardon under the privy seal significantly describes Henry Russell of Weymouth, merchant, as *alias* Henry Gascoign, gentleman, and it is therefore probable that the dual house of Bedford springs from a family of Gascon wine-merchants settled in a port of Dorsetshire, a county remarkable for the number of such French settlers.

Henry Russell of Weymouth made a firm footing upon the land by his marriage with Elizabeth Hering, one of the two daughters and co-heirs of John Hering of Chaldon Hering, a Dorsetshire squire of old family, heir of the Winterbournes of Winterbourne Clenton and of the Cernes of Draycot Cerne. John Russell, eldest son of this match, born before 1432, and returned to parliament for Weymouth in 1450, had his seat at Berwick in Swyre, he and his son and heir, James Russell, being buried in the parish church of Swyre.

JOHN RUSSELL, son and heir of James, on the accession of Henry VIII. advanced rapidly serving the crown as soldier and as diplomatic agent. He fought well at Théroutanne, saw the Field of the Cloth of Gold and the French disaster at Pavia, lost an eye by an arrow at Morlaix. In 1523 he was knight-marshal of the king's household. In 1526 he married a rich widow, Anne, daughter and co-heir of Sir Guy Sapcotes by the co-heir of Sir Guy Wolston, a match which brought to the Russells the Buckinghamshire estate of Chenies, in whose chapel many generations of them lie buried. His peerage as Lord Russell of Chenies dated from 1539, and in the same year he had the Garter. Having held many high offices, he was named by Henry VIII. as one of his executors. At the crowning of Edward VI. he was lord high steward, and after his defeat of the western rebels was raised, in 1550, to the earldom of Bedford. Queen Mary, like her brother, made him lord privy seal. He died in London in 1555, leaving to his son a vast estate of church lands. In the west he had the abbey lands of Tavistock, which give a marquess's title to his descendants. In Cambridgeshire he had the abbatial estate of Thorney, in Bedfordshire the Cistercian house of Woburn, now the chief seat of the Russells. In London he had Covent Garden with the "Long Acre."

He left an only son, FRANCIS, second earl of Bedford, K.G. (c. 1527–1585), who, being concerned in Wyatt's plot, escaped to the Continent and joined those exiles at Geneva whose religious sympathies he shared. He returned in 1557, and was employed by Queen Mary before her death. Under Queen Elizabeth he governed Berwick, and was lord-lieutenant of the northern counties.

Three of his four sons died before him, the third, killed in a border fray, being father of Edward, third earl of Bedford, who died without issue in 1627. The fourth son, William, created Lord Russell of Thornhaugh in 1603, was a soldier who fought fiercely before Zutphen beside his friend Sir Philip Sidney, whom he succeeded as governor of Flushing, and was from 1594 to 1597 lord-deputy of Ireland. He died in 1613, leaving an only son, FRANCIS, who in 1627 succeeded his cousin as fourth earl of Bedford. This earl built the square of Covent Garden, and headed the "undertakers" who began the scheme for draining the great Fen Level. He opposed the king in the House of Lords, but might have played a part as mediator between the sovereign and the popular party who accepted his leadership had he not died suddenly of the smallpox in 1641 on the day of the king's assent to the bill for Strafford's attainder. WILLIAM, the eldest surviving son, succeeded as fifth earl, Edward, the youngest son, being father of Edward Russell (1653–1727), admiral of the fleet, who, having held the chief command in the victory of La Hogue, was created in 1697 earl of Orford. The fifth earl of Bedford, after fighting for the parliament at Edgehill and for the king at Newbury, surrendered to Essex and occupied himself with completing the drainage of the Bedford Level. He carried St. Edward's staff at the crowning of Charles II., but quitted political life after the execution of his son, Lord Russell, in 1683. In 1694 he was created duke of Bedford and marquess of Tavistock, titles to which his grandson, WRIOTHESLEY RUSSELL, succeeded in 1700.

The "patriot" Lord Russell had added to the family estates by his marriage with Rachel, daughter and co-heir of Thomas Wriothesley, the fourth earl of Southampton, from whom she finally inherited the earl's property in Bloomsbury, with Southampton house, afterwards called Bedford house. Her son, the second duke of Bedford, married the daughter of a rich citizen, John Howland of Streatham, a match strangely commemorated by the barony of Howland of Streatham, created for the bridegroom's grandfather, the first duke, in 1695. The third duke, another WRIOTHESLEY RUSSELL (1708-1732), died without issue, his brother JOHN (1710-1771) succeeding him. This fourth duke, opposing Sir Robert Walpole, became, by reason of his rank and territorial importance, a recognized leader of the Whigs. In the duke of Devonshire's administration he was lord-lieutenant of Ireland, and he served as lord high constable at the coronation in 1760.

His son Francis, styled marquis of Tavistock, was killed in 1767 by a fall in the hunting field, and Lord Tavistock's son FRANCIS (1765-1802) became the fifth duke. This was the peer whom Burke, smarting from a criticism of his own pension, assailed as "the Leviathan of the creatures of the crown," enriched by grants that "outraged economy and even staggered credibility." He pulled down Bedford house, built by Inigo Jones, Russell square and Tavistock square rising on the site of its gardens and courts. Dying unmarried, he was succeeded by his brother JOHN, the sixth duke (1766-1839), whose third son was the statesman created, in 1861, Earl Russell of Kingston Russell, better known as Lord John Russell. Lord Odo Russell, a nephew of "Lord John," and ambassador at Berlin from 1871 to his death in 1884, was created Lord Amphil in 1881. HERBRAND ARTHUR RUSSELL (1858-1940), the eleventh duke and fifteenth earl, succeeded an elder brother in 1893. (O. B.)

RUSSELL, BERTRAND ARTHUR WILLIAM RUSSELL, 3RD EARL, F.R.S. (1872-), was born May 18, 1872. His grandfathers were Lord John Russell (afterwards Earl Russell) and the second Lord Stanley of Alderley. At the age of three he was left an orphan. His father had wished him to be brought up as an agnostic; to avoid this he was made a ward of Court, and brought up by his grandmother at Pembroke lodge, in Richmond park. Instead of being sent to school he was taught by governesses and tutors, and thus acquired his perfect knowledge of French and German. In October 1890 he went into residence, as a very shy undergraduate, at Trinity college, Cambridge. After being a very high Wrangler and obtaining a First Class with distinction in philosophy he was elected a fellow of his college in the autumn of 1895. But he had already left Cambridge in the summer of 1894 and for some months was attached at the British embassy at Paris. In Dec. 1894 he married Miss Alys Pearsall Smith. After spending some months in Berlin studying social democracy (*German Social Democracy*, 1896), they went to live near Haslemere, where he devoted his time to the study of philosophy. In 1900 he visited the Mathematical Congress at Paris with his friend Alfred Whitehead (afterwards professor of philosophy at Harvard). He was impressed with the ability of the Italian mathematician Peano and his pupils, and immediately studied Peano's works. In 1903 he wrote his first important book, *The Principles of Mathematics* and with Whitehead proceeded to develop and extend the mathematical logic of Peano and Frege. The first volume of their joint book, *Principia Mathematica*, was published in 1910. During all this period Russell lived very simply and worked very hard. From time to time, as when Joseph Chamberlain started his tariff reform campaign, he abandoned philosophy for politics. In 1910 he was appointed lecturer at his old college. After World War I broke out he took an active part in the No Conscription fellowship. He was fined £100 as the author of a leaflet criticising a sentence of two years on a conscientious objector. His library was seized to pay the fine; it was bought in by a friend; but many valuable books were lost. His college deprived him of his lectureship. He was offered a post at Harvard university, but was refused a passport. He intended to give a course of lectures (afterwards published in America as *Political Ideals*, 1918) but was prevented by the military authorities. In 1918 he was sen-

tenced to six months' imprisonment for a pacifistic article he had written in the *Tribunal*. His excellent *Introduction to Mathematical Philosophy* (1919) was written in prison. His *Analysis of Matter* (1927) was the outcome of some lectures he gave in London which were organized by a few friends who got up a subscription for the purpose. The *Practice and Theory of Bolshevism* (1920) was written after a short visit to Russia.

In the autumn of 1920 he went to China to lecture on philosophy at the Peking university. On his return in Sept. 1921, having been divorced by his first wife, he married Miss Dora Black and they lived for six years in a small house in Chelsea during the winter months. He earned a livelihood by lecturing, journalism and writing popular books such as *The A.B.C. of Atoms* (1923), *The A.B.C. of Relativity* (1925) and *On Education* (1926). The summers, spent near Lands End, were devoted to serious work such as the new Introduction to the second edition of the *Principia Mathematica*; *The Analysis of Matter* (1927); *The Outline of Philosophy* (1928); *Mysticism and Logic* (1929); *Marriage and Morals* (1930). In 1927 he and his wife started a school for young children, which they operated until 1932. He succeeded to the earldom in 1931. Russell was divorced by his second wife in 1935 and the following year married Patricia Helen Spence. In 1938 he went to the United States and during the next years taught at many of the country's leading universities. In 1940 he was involved in legal action when his right to teach philosophy at the College of the City of New York was questioned because of his views on morality. When his appointment to the college faculty was cancelled, Russell accepted a five-year contract as a lecturer for the Barnes foundation, Merion, Pa., but cancellation of this contract was announced in Jan. 1943 by Albert C. Barnes.

In 1944 Russell returned to England and was elected to a fellowship of Trinity college for the second time. He gave the first series of the Reith lectures, 1948-49, on the topic "Authority and the Individual." In Nov. 1950 he was awarded the Nobel prize for literature.

Russell's later writings include *The Conquest of Happiness* (1930); *The Scientific Outlook* (1931); *Education and the Social Order* (1932); *Freedom and Organisation, 1814-1914* (1934); *Power: A New Social Analysis* (1938); *An Inquiry into Meaning and Truth* (1940); *A History of Western Philosophy* (1946); *Authority and the Individual* (1949); *Unpopular Essays* (1950).

(C. F. SA; X.)

Philosophy.—What is fundamental in Russell's philosophy is his logic; his views on metaphysics and ethics, on the nature and relations of matter and mind have changed profoundly in the course of his life, but these changes have all proceeded from successively deeper applications of his logical method. He, therefore, preferred to classify his philosophy not as a species of Idealism or Realism but as "Logical Atomism," since what distinguishes the whole of his work is his use of logical analysis as a method and his belief that by it we can arrive at ultimate "atomic facts" logically independent both of one another and of being known.

His first great achievement was to free logical analysis from the domination of ordinary grammar, and to realize that the grammatical form of a sentence often fails to reflect the logical form of its meaning. In his *Principles of Mathematics* (1903) he insisted that relations could not be reduced to qualities of their terms, and that relational facts were not of the subject-predicate form, but he still thought that any descriptive phrase which could be made the subject of a sentence must stand for a term which had being, even if like "the round square" it were self-contradictory. But in his article "On Denoting" (*Mind*, 1905), and in subsequent writings, he put forward his "Theory of Descriptions" which is perhaps the most important as well as the least controversial of his discoveries. According to this theory "the present king of France" is not a name for a non-existent entity but an "incomplete symbol" which only has meaning in connection with a context. The meaning of such a statement as that "the present king of France is bald" is firstly that there is someone who is at present both king of France and bald, and secondly that there are not at present two kings of France; and when such statements are analyzed in this way the need to

believe in entities such as "the present king of France" (which are said by some philosophers to have "being" but not "existence") is altogether removed. Similarly when it is said that "unicorns are not real," this does not have the same kind of meaning as the grammatically similar statement that "lions are not versatile." For this last statement means that certain animals, namely lions, lack a certain characteristic, namely versatility; but "unicorns are not real" does not mean that certain animals, namely unicorns, lack the characteristic of reality. For there are no such animals and no such characteristic; what is meant is simply that there are no animals which have one horn but otherwise resemble horses. The destructive effect of this logical analysis on many philosophical theories of existence and reality is important.

Russell applied similar methods to propositions, classes and numbers and argued that each of these categories consists of what he called "logical constructions," and not of genuine entities. In saying, e.g., that classes are logical constructions, he did not mean that they are entities constructed by the human mind, but that when we express facts by sentences which have for subject such a phrase as "the class of men," the true analysis of the fact does not correspond to the grammatical analysis of the sentence. When, for instance, we say "the class of men includes the class of criminals," the fact we assert is really about the characteristics of being a man and being a criminal and not about any such entities as classes at all. This notion of a logical construction was much employed by Russell in his work in mathematical logic, and he also used it extensively in the philosophy of matter and mind, and even adopted as a fundamental principle that constructions (in his special sense of the word) are to be substituted for inferred entities wherever possible.

By applying this method he was led to a view of the world on which the ultimate constituents of mind and matter are of the same type, the difference between minds and bodies lying in their structure and not in the elements of which they are composed. A man's mind is composed of sensations and images, which are identified by Russell with physical events in his brain, the difference between physics and psychology lying not in the events they study but in the kind of laws about those events which they seek to establish, physics being concerned with structure and psychology with quality. This theory was worked out in connection with physics in *The Analysis of Matter* (1927).

In the theory of knowledge Russell's earlier rationalism was considerably modified in a pragmatist or behaviourist direction, and in the *Analysis of Mind* (1921) he rejected consciousness as a fundamental characteristic of mind and adopted a form of "neutral monism" about perception, which he combines with representationism in regard to memory and judgment.

Mathematics.—Russell maintained that mathematics and formal logic are one and that the whole of pure mathematics can be rigidly deduced from a small number of logical axioms. He argued this in outline in the *Principles of Mathematics* (1903) which was followed by a detailed demonstration of his thesis in *Principia Mathematica* (1911–13) written in collaboration with A. N. Whitehead. In this colossal work the deduction is actually performed according to the strictest symbolic principles and carried so far as to include all the essential parts of the theory of aggregates and real numbers. Besides this the great advances made by Russell in the analysis of logical concepts allowed the deductions to be carried not only much further forwards, but also much further backwards towards first principles. Above all he succeeded in solving the notorious Paradoxes of the Theory of Aggregates by means of the "Theory of Types." As part of this theory, it was, however, found necessary to introduce an "Axiom of Reducibility" which has never obtained general acceptance, so that Russell's work cannot be regarded as a final solution of the problem, although in the second edition of *Principia Mathematica* (1925) he found an ingenious way of overcoming the difficulties in the particular case of mathematical induction.

(F. P. R.)

RUSSELL, GEORGE WILLIAM (1867–1935), Irish writer and painter, known as *Æ*, was born at Lurgan, Co. Armagh, April 10, 1867. Educated at Rathfarnham School, Dublin, he en-

tered an accountant's office, but in 1897 joined the Irish Agricultural Organisation Society, and became an organiser of agricultural societies. From 1904 to 1923 he was editor of *The Irish Homestead*, the organ of the agricultural co-operative movement. In 1923 he became editor of *The Irish Statesman*.

Russell's publications include *Homeward: Songs by the Way* (1894); *The Earth Breath* (1897); *Literary Ideals in Ireland* (1899), a collection of essays written in collaboration with W. B. Yeats, W. Larmine and John Eglington; *Ideals in Ireland* (1901), another book of collaborative essays; *The Nuts of Knowledge* (1903), a selection of lyrics. In 1904 appeared two books of verse, the *Divine Vision* and *New Poems*, an anthology of verses by young Irish poets; and a collection of mystical tales, *The Mask of Apollo*. Other books of verse include *By Still Waters* (1906), *Collected Poems* (1913), and *Gods of War* (1915). *The Hero in Man* (1909) and *The Renewal of Youth* (1911) were imaginative musings, as was *Imaginations and Reveries* (1915). In 1906 appeared *Some Irish Essays*, and in 1907 *Deirdre*, a three-act play. *Co-operation and Nationality* and *The Rural Community*, published in 1912 and 1913 respectively, were pamphlets embodying co-operative ideals, which are further developed in his *The National Being, Thoughts on an Irish Polity* (1916). *The Candle of Vision*, an attempt to discover the element of truth in the mystical imagination, appeared in 1918. This was followed by *The Interpreters* (1920), a symposium in the Platonic fashion. A volume of poems, *Voices of the Stones*, appeared in 1925. He received the honorary degree of Litt.D. from Dublin University in July, 1929.

RUSSELL, JOHN (1745–1806), British portrait painter in pastel, was born at Guildford, Surrey, on Mar. 29, 1745. At an early age he entered the studio of Francis Cotes, R.A. In 1767 he set up his own studio, and in 1770 obtained the gold medal at the Royal Academy for figure drawing. He exhibited regularly at the Academy from its beginning down to 1805. Although he painted in oil, in water-colours and in miniature, it was by his works in crayon that he became famous. He made his own crayons, blending them on his pictures by a peculiar method termed "sweetening," which consisted in rubbing in the colours with his fingers and softening them in outline until they melted one into another. His works have survived in perfect condition. He died at Hull on April 20, 1806.

His "Child with Cherries" is in the Louvre. The J. Horace Harding Collection, New York City, contains his "Mr. and Mrs. Algar and Children." In *The Elements of Painting in Crayon* he described his methods. See George C. Williamson, *John Russell* (1894).

RUSSELL, JOHN RUSSELL, 1ST EARL (1792–1878), British statesman, third son of the 6th duke of Bedford, by Georgiana Elizabeth Byng, second daughter of the 4th Viscount Torrington, was born in London on Aug. 18, 1792. After an early education desultory on account of his weak health he spent three years at Edinburgh university, living in the house of Professor John Playfair. On leaving the university, he travelled in Portugal and Spain, and in 1813 he was returned for the ducal borough of Tavistock. In domestic questions he cast in his lot with those who opposed the repressive measures of 1817, and protested that the causes of the discontent at home should be removed by remedial legislation. Failing of success, he resigned his seat for Tavistock in March 1817, and meditated permanent withdrawal from public life, but was dissuaded from this step by the arguments of his friends. In the parliament of 1818–20 he again represented the family borough in Devon, and in May 1819 began his long advocacy of parliamentary reform by moving for an inquiry into the corruption which prevailed in the Cornish constituency of Grampound. During the first parliament (1820–26) of George IV. he sat for the county of Huntingdon, and secured in 1821 the disfranchisement of Grampound, but the seats were not transferred to the constituency which he desired. Lord John Russell paid the penalty for his advocacy of Catholic emancipation with the loss in 1826 of his seat for Huntingdon county, but he found a shelter in the Irish borough of Bandon Bridge. He led the attack against the Test Acts by carrying in February 1828 with a majority of forty-four a motion for a committee to inquire

into their operations, and after this decisive victory they were repealed (May 9, 1828). He warmly supported the Wellington ministry when it realized that the king's government could only be carried on by the passing of a Catholic Relief Act (April 1829). For the greater part of the short-lived parliament of 1830-31 he served his old constituency of Tavistock, having been beaten in a contest for Bedford county at the general election by one vote; and when Lord Grey's Reform ministry was formed, in November 1830, Lord John Russell became paymaster-general, without a seat in the cabinet. This exclusion was the more remarkable in that he was chosen (1st of March 1831) to explain the provisions of the Reform Bill, to which the cabinet had given formal sanction. The Whig ministry was soon defeated, but, after the general election, returned with increased strength. The Reform Bill became law (June 7, 1832), and Lord John stood justly in the mind of the people as its champion. After the passing of the Reform Bill he sat for South Devon, and was paymaster-general in the ministries of Grey and Melbourne.

Russell had visited Ireland in the autumn of 1833, and had come back with a keen conviction of the necessity for rejustifying the revenues of the Irish church. To these views he gave expression in a debate on the Irish Tithe Bill (May 1834), whereupon Stanley, with the remark that "Johnny has upset the coach," resigned his place. The latter was abruptly, if not rudely, dismissed (Nov. 1834) by William IV. when the leadership of the House of Commons became vacant and Russell was proposed as leader. In Lord Melbourne's new administration of 1835 Russell became home secretary and leader of the House of Commons. In the third Melbourne administration (1839) Russell was secretary of State for the colonies and under him New Zealand became a British colony and England claimed the whole of Australia. A fine literary sense and a great love of all forms of religious and civil liberty fed his keen interest in culture for the people and resulted in a Government grant of £30,000 for education and the institution of official inspectors for schools. With Brougham he founded in 1835 the Society for Promoting the Diffusion of Useful Knowledge. At the general election of 1841 the Whigs sustained a crushing defeat; the return of Russell for the City of London was one of their few triumphs. In 1845 he committed himself for the first time to the repeal of the Corn Laws.

On Peel's resignation (1846) the task of forming an administration was entrusted to Russell, and he remained at the head of affairs from July 1846 to Feb. 1852, but, though his ministry at once set to work to adapt the Free Trade policy to all branches of British commerce, his tenure of office was not marked by any great legislative enactments. His celebrated Durham letter (Nov. 4, 1850) on the threatened assumption of ecclesiastical titles by the Roman Catholic bishops weakened the attachment of the "Peelites" and alienated his Irish supporters. The impotence of their opponents, rather than the strength of their friends, kept the Whig ministry in power, and, although beaten by a majority of nearly two to one on Locke King's County Franchise Bill in Feb. 1851, it could not divest itself of office. Lord Palmerston's unauthorized recognition of the French *comp d'état* was followed by his dismissal from the post of foreign secretary (Dec. 1851), but he had his revenge in the ejection of his old colleagues in Feb. 1852. During Lord Aberdeen's administration Lord John Russell led the Lower House, at first as foreign secretary (to Feb. 21, 1853), then without portfolio, and lastly as president of the council (June 1854). In 1854 he brought in a Reform Bill, but in consequence of the war with Russia the bill was allowed to drop. His popularity was diminished by this failure, and although he resigned in Jan. 1855, on Mr. Roebuck's motion for an inquiry into the conduct of the war in the Crimea, he did not regain his old position in the country. At the Vienna conference (1855) Lord John Russell was England's representative, and immediately on his return he became secretary of the colonies (May 1855), but the errors in his negotiations at the Austrian capital followed him and forced him to retire in July of the same year.

For some years after this he was the "stormy petrel" of politics. He was the chief instrument in defeating Lord Palmerston

in 1857. He led the attack on the Tory Reform Bill of 1859. A reconciliation was then effected between the rival Whig leaders, and Russell became foreign secretary in Palmerston's ministry (1860) and accepted an earldom (July 1861). During the American War Russell exercised a powerful influence in restraining his country from taking sides in the contest, and he warmly sympathized with the efforts for the unification of Italy, but he was not equally successful in preventing the spoliation of Denmark. On Palmerston's death (Oct. 1865) Russell was once more summoned to form a cabinet, but the defeat of his ministry in the following June on the Reform Bill which they had introduced was followed by his retirement from public life. His leisure hours were spent after this event in the preparation of numberless letters and speeches, and in the composition of his *Recollections and Suggestions* (1875). He died at Pembroke Lodge, Richmond Park, on May 28, 1878.

Earl Russell was twice married—first in 1835, to Adelaide, daughter of Mr. Thomas Lister, and widow of Thomas, second Lord Ribblesdale, and secondly, in 1841, to Lady Frances Ann Maria, daughter of Gilbert, second earl of Minto.

Russell's tales, tragedies and essays (including *The Nun of Arrouca*, 1822, and *Essays and Sketches by a Gentleman who has left his Lodgings*, 1820) are forgotten, but his historical works, *Life of William Lord Russell* (1819), *Memoirs of the Affairs of Europe* (1824-29, 2 vols.), *Correspondence of John, 4th Duke of Bedford* (1842-46, 3 vols.), *Memorials and Correspondence of C. J. Fox* (1853-57, 4 vols.) and *Life and Times of C. J. Fox* (1859-66, 3 vols.) are among the chief authorities on Whig politics. He also edited the *Memoirs, Journal and Correspondence of Thomas Moore* (1853-56, 8 vols.).

The chief biography is that by Sir Spencer Walpole (1891, 2 vols.). The volume by Stuart J. Reid (1895, "Prime Ministers of Queen Victoria" Series) should also be consulted.

See also J. Russell, *The Latter Correspondence of Lord John Russell, 1840-1878* (1915, 2 vols.).

RUSSELL, THOMAS (1762-1788), English poet, was born at Beaminster, early in 1762. He was educated at Winchester under Joseph Warton, and at New College, Oxford. He died at Bristol on July 31, 1788, and was buried at Powerstock, Dorset. In 1789 was published a thin volume, containing his *Sonnets and Miscellaneous Poems*, now a very rare book. It contained 23 sonnets, of regular form, and a few paraphrases and original lyrics. The sonnets are the best, and by right of these Russell takes his place as a precursor of the romantic school. His sonnet, "Suppos'd to be written at Lemnos," is his masterpiece.

RUSSELL, LORD WILLIAM (1639-1683), English politician, was the third son of the 1st duke of Bedford and was born on Sept. 29, 1639. About 1654 he was sent to Cambridge with his elder brother Francis (on whose death in 1678 he obtained the courtesy title of Lord Russell). On leaving the university, the two brothers travelled abroad, visiting Lyons, Geneva, Augsburg, and Paris, but returned to Woburn in December 1659. At the Restoration he was elected for the family borough of Tavistock. He appears to have indulged in the follies of court life and intrigue; for both in 1663 and 1664 he was engaged in duels, in the latter of which he was wounded. In 1669 he married Rachel (1636-1723), second daughter of the 4th earl of Southampton, and widow of Lord Vaughan, thus becoming connected with Shaftesbury, who had married Southampton's niece. With his wife Russell always lived on terms of the greatest affection and confidence. She corresponded with Tillotson and other distinguished men, and a collection of her admirable letters was published in 1773.

On the formation of the "country party," in opposition to the Cabal and Charles's French-Catholic plots, Russell began to take an active part in affairs. He then joined Cavendish, Birch, Hampden, Powell, Lytleton and others in vehement antagonism to the court. With a passionate hatred and distrust of the Catholics, and an intense love of political liberty, he united the desire for ease to Protestant Dissenters. He inveighed (Jan. 22, 1673) against the stop of the exchequer, the attack on the Smyrna fleet, the corruption of courtiers with French money, and "the ill ministers about the king"; he supported the proceedings against the duke of Buckingham, and against Danby (see LEEDS, THOMAS OSBORNE); and in March 1678 he seconded the address praying the

king to declare war against France. The country party hated Danby and James more than they hated Louis. The French king formed a temporary alliance with Russell, Hollis and the opposition leaders, on terms. Russell in particular entered into close communication with the marquis de Ruigny (Lady Russell's maternal uncle), who came over with money for distribution among members of parliament. By the testimony of Barillon, however, it is clear that Russell refused any part in the intended corruption.

By the wild alarms which culminated in the Popish Terror Russell was apparently deeply affected. He threw himself into the party which looked to Monmouth as the representative of Protestant interests, a grave political blunder, though he afterwards was in confidential communication with Orange. On Nov. 4, 1678, he moved an address to the king to remove the duke of York from his person and councils. At the dissolution of the penitentiary parliament, he was, in the new elections, returned for Bedfordshire. Danby was at once overthrown, and in April 1679 Russell was one of the new privy council formed by Charles on the advice of Temple. Only six days after this we find him moving for a committee to draw up a bill to secure religion and property in case of a popish successor. He does not, however, appear to have taken part in the exclusion debates at this time. In June, on the occasion of the Covenanters' rising in Scotland, he attacked Lauderdale personally in full council.

In January 1680 Russell, along with Cavendish, Capell, Powell, Essex and Lyttleton, tendered his resignation to the king, which was received by Charles "with all my heart." On June 26, he accompanied Shaftesbury, when the latter indicted James at Westminster as a popish recusant; and on Oct. 26 he took the extreme step of moving "how to suppress popery and prevent a popish successor"; on Nov. 2, now at the height of his influence, he seconded the motion for exclusion in its most emphatic shape, and on the 19th carried the bill to the House of Lords for their concurrence. The limitation scheme he opposed, on the ground that monarchy under the conditions expressed in it would be an absurdity. On December 28 he moved to refuse supplies until the king passed the Exclusion Bill. The prince of Orange having come over at this time, there was a tendency on the part of the opposition leaders to accept his endeavours to secure a compromise on the exclusion question. Russell, however, refused to give way a hair's-breadth.
